SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 5
MARCH 1, 1979

W79-02001—W79-02500

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ION MOBILITIES IN PURE WATER VAPOUR AT SATURATION,
Missouri Univ.-St Louis. Dept. of Physics.
B. L. Henson.
Journal of Physics D. Applied Physics, Vol 11 p 1405-1411, 1978. 3 fig, 25 ref. OWRT A-047-MO(2), 14-31-0001-3525.

Descriptors: Conductivity, Trace ionic impurities, Electroanalysis, Time-of-flight techniques, *Ion transport, *Water vapor, *Electrochemistry, *Thermal dissociation.

Positive and negative charge carrier mobilities in pure water vapour have been measured under conditions of liquid-vapour equilibirum in the temperature range of 20-70C. Both signs of charge carriers have the same measured mobility and evidence is given for heavy ion clustering. These data are explained in terms of the Chapman-Enskog kinetic theory mobility equation and the clustering is shown to obey a thermal dissocation law.

2A. General

COMPLEX RELATIONS BETWEEN THE HYDROLOGIC BUDGET OF THE MAJOR GEOGRAPHIC ZONES OF THE EARTH,
Akademiya Nauk SSSR, Moscow. Inst. Geografii.
A. V. Belyayev.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 30-37, 1977. 7 fig, 1 tab, 21 ref. Translated from News of the USSR Academy of Sciences, Geographic Series (Izvestiya Akad. nauk SSSR. Ser. geogr.), No. 1, p 38-50, 1977.

Descriptors: *Hydrologic budget, *Regions, *Hydrologic equation, *Mathematical models, Analytical techniques, Analysis, Hydrology, Evaporation, Precipitation(Atmospheric), Hydrologic cycle, Hydrologic aspects, Infiltration, Runoff, Runoff coefficient, Foreign research, Foreign countries, *USSR.

A system of zonal hydrologic relations was presented that combines zonal structural and interpolation relations according to a six-component system of hydrologic equations and on the principle of geographic zonality. Some properties of such relations were investigated, and analytic expressions for their descriptions were proposed. Values were tabulated of the relative characteristics of the hydrologic budget, including the coefficient of total wetting (W/P) and the runoff coefficient (R/P), taken from this complex zonal relations and corresponding to precipitation of 500 and 1000 mm. When the absolute amount of precipitation doubles (increases from 500 to 1000 mm), the total wetting coefficient decreases by an average of 7-14%, and the runoff coefficient increases by 23%, i.e., these relative characteristics do not vary very significantly with different amounts of precipitation within a single zone. Yet the change in the entire combination of physiographic conditions, besides precipitation, produces great changes in the structure of the hydrologic budget. For example, with a hypothetical precipitation of 1000 mm, more than twice as much water is spent on infiltration in savannas than in the tundra. The difference in the structure of total river runoff is also considerable. Whereas groundwater runoff accounts for only 8% of the total river runoff in the tundra, mainly because of permafrost which prevents the seepage of water to the water table, its proportion is 30% in the mixed forest zone of the temperate belt. DROUGHT IN THE UPPER MIDWEST, 1931-1969,
Iowa Univ., Iowa City. Dept. of Geography.
M. P. Klugman.
Journa of Applied Meteorology, Vol. 17, No. 10, p 1425-1431, October 1978. 4 fig, 3 tab, 18 ref.

Descriptors: *Droughts, *Precipitation(Atmospheric), *Central U.S., *Great Plains, *Climatology, Weather, Rainfall, Statistics, Statistical methods, Data collections, Analytical techniques, Data processing, Distribution patterns, Meteorology, Eigenvector analysis.

Monthly Palmer Drought Index values for the periods 1931-40, 1941-50, 1951-60, and 1961-69 were subjected to eigenvector analysis. Patterns and periods of variable moisture conditions resulted which fit the patterns found in drought studies of areas east and west of the upper Midwest. The 1930's and 1950's included years of severe drought, but the patterns of drought were not identical. The 1930's drought spread from the west; the 1950's drought spread from the south and southwest. The 1940's and 1960's were wetter than normal in the upper Midwest. (Sims-ISWS)

ANALYSIS OF ERROR IN THE DETERMINATION OF SNOW STORAGE FOR SMALL HIGH ARCTIC BASINS,
McMaster Univ., Hamilton (Ontario). Dept. of Geography.
M. K. Woo, and P. Marsh.
Journal of Applied Meteorology, Vol. 17, No. 10, p 1537-1541, October 1978. 4 fig, 1 tab, 10 ref.

Descriptors: *Water balance, *Snowpacks, *Snow surveys, *Storage, *Arctic, *Canada, Snowmelt, Melt water, Runoff, Water resources, Snow, Snowfall, Watersheds(Basins), Tundra, Terrain analysis, Regression analysis, Data processing, Meteorology, *Snow storage.

Water balance studies in tundra regions require accurate snowfall data, but weather station records often underestimate basin snow storage. However, snow storage can be determined by snow surveys conducted prior to the melt period because Arctic snowpacks do not melt during winter. Topography strongly controls snow distribution. A basin can be subdivided into various terrain types, and the snow survey then establishes the snow characteristics of each terrain type so that basin snow storage is obtained as the areally weighted mean. Such a survey was carried out in small basins near Resolute, Northwest Territories, traversing different types of terrain. The results confirmed that weather station snowfall grossly understimated basin snow storage. Since it is also desirable to simplify future snow surveys by reducing the number of transects, an error analysis was performed to determine the error resulting from a grouping of terrain types. It was found that both maximum and mean error increased as the number of terrain types was reduced, but the increase was not substantial when certain terrain types were combined. A mean error of 15% is expected when only four types of terrain (hilltops, flats, gullies, valleys, and slopes) are recognized in the survey, but the error quickly increases when further simplification of the terrain is introduced. (Sims-ISWS)
W79-02197

COMPUTATION OF SOIL FREEZING DEPTH IN THE ZONE OF AERATION,
G. P. Zhmayeva.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 17-20, 1977. 2 fig, 8 ref. Translated from Transactions of the Hydrometeorological Scientific Research Center of the USSR (Trudy GMTs), No. 183, p 48-55, 1977.

Descriptors: *Zone of aeration, *Freezing, *Soils, *Mathematical models, Thawing, Unsaturated flow, Analytical techniques, Soil moisture, Depth, Mathematical studies, Equations, Foreign research, Foreign countries, Soil temperature, *USSR.

In some regions of the USSR, spring runoff losses are affected not only by soil moisture but also largely by the depth of soil freezing. Unfortunately, available network observations of freezing depth are insufficient in many cases to account for its effect because of observation shortages and also because of the large variations in freezing conditions over a drainage basin. A method was proposed for computing soil freezing depth on the basis of methods of mathematical physics. This method was designed for the use of standard observations at the station network of the Hydrometeorologic Service. Use of the proposed model of soil freezing (thawing) makes it possible to obtain the following additional information on this process: (1) the dynamics of the freezing front; (2) the vertical soil temperature distribution in the frozen and thawed zones; and (3) the variation of the soil moisture curve in the thawed zone. The proposed model was verified in the Kostroma River basin from standard observations over the period from 1955 to 1973. The computed and measured freezing depths were close. (Humphreys-ISWS)

W79-02215

PHYSICAL PROPERTIES OF ICEBERGS, PART I--HEIGHT TO DRAFT RATIOS OF ICEBERGS, PART II--MASS ESTIMATION OF ARCTIC ICEBERGS,
Coast Guard Research and Development Center, Groton, CT.
R. Q. Robe, and L. D. Farmer.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A037 240, Price codes: A05 in paper copy, A01 in microfiche. Report CG-D-102-76, June 1976. 25 p, 8 fig, 5 tab, 9 ref.

Descriptors: *Icebergs, *Mass, *Height, *Shape, Surveys, Remote sensing, Ice, Sea ice, Photography, Aircraft, Aerial photography, Data processing, Sonar, Height to draft ratios, Iceberg mass.

A study of height-to-draft ratios of icebergs near the Davis Strait revealed ratios which range from 1:1.28 to 1:10.56. The ratios of bergs dominated by their horizontal dimension, such as tabular or broken tabular icebergs, have average height-to-draft ratios of 1:4.46 and 1:4.26, respectively. Bergs with a more vertical nature, pinnacle or drydock bergs, have ratios averaging 1:2.31 and 1:2.41, respectively. The smallest ratios are found in domed bergs, which average 1:6.30. If it is assumed that the height-to-draft ratio of icebergs is characterized by a continuous distribution and then a Kruskal-Wallis one-way analysis of variance technique is used, the hypothesis that the average ratio of icebergs is not significantly different for gross visual shape classes can be tested. The result was that for the sample icebergs there is no significant difference. For summary purposes, the average of the averages (1:3.95) can be used as descriptive of the height draft ratio of icebergs regardless of visual shape class. Between the berg heights of 10 m and 60 m, which is the range of this sample, the height was related to the height-to-draft ratio by a power curve. Analysis of stereo pairs of 22 icebergs, in the region of Davis Straits, revealed that a reasonable estimate of total iceberg mass, in metric tons, can be arrived at by multiplying the gross dimensions of the iceberg (height x width x length) in meters together, and then multipying this produce by a factor of 3.01. This factor accounts for the density difference between seawater and freshwater ice; it also accounts for the average shape and mass distribuion of icebergs. (Sims-ISWS)
W79-02216

CONSTRUCTION AND OPERATION OF LOW-PRESSURE DAMS ON PERMAFROST SOILS,
For primary bibliographic entry see Field 8D.
W79-02220

SUPERCOOLING OF WATER TO -92 DEGREES C UNDER PRESSURE,
Purdue Univ., Lafayette, IN. Dept. of Chemistry.
H. Kanno, R. J. Speedy, and C. A. Angell.
Science Vol. 189, p 880-881, September 1975. 1 fig, 17 ref. OWRT B-051-IND(8).

Descriptors: *Supercooling, *Differential thermal analysis, Crystallization, Freezing, Nucleation.

The temperature at which 'clean' supercooled water freezes has been determined as a function of pressure up to 3 kilobars, using a differential thermal analysis technique on subdivided water samples. The supercooling limit of such samples, -38 degrees C at normal pressure, is lowered by initial increase of pressure, reaching a minimum value of -92 degrees C at 2.00 kilobars.
W79-02494

2D. Evaporation and Transpiration

THE MICRO-CLIMATE OF NARROW- AND WIDE-ROW SORGHUM WITH EQUAL PLANT DENSITIES,
Kansas State Univ., Manhattan. Evapotranspiration Lab.
J. J. Owonubi, E. T. Kanemasu, and W. L. Powers.
Agricultural Meteorology, Vol 15, p 61-69, 1975. 5 fig, 3 tab, 11 ref. OWRT A-056-KAN(2), 14-31-0001-3816.

Descriptors: *Evapotranspiration, Advection, *Sorghum, Microclimates, *Net radiation, *Sensible heat, Stomatal resistance, Leaf water potential.

Net radiation, evapotranspiration (lysimetric), soil heat flux, temperature, vapor pressure, and wind speed were measured within and above narrow- and wide-row sorghum with equal plant density. Total energy balance for 9 clear days showed no significant difference in net radiation (Rn) above the narrow and wide rows. Evapotranspiration (LE) accounted for an average of 88% and 89% of Rn in the narrow and wide rows, respectively. LE/Rn percentage was over 100 in the wide rows for August 25 and 26, 1973. The latter part of the growing season, temperature inversions above the crop canopies confirmed large-scale advection. Negative sensible heat at the beginning of the season and the below-canopy-energy balance suggest within-row advection, especially in wide row sorghum. Temperature decreased with downwind distance from a stubble field but vapor pressure increased with increasing distance. Stomatal resistance decreased and leaf-water potential increased (less negative) with downwind distance.
W79-02358

ADVECTION MODIFICATION OF THE PRIESTLEY AND TAYLOR EVAPOTRANSPIRATION FORMULA,
Wisconsin Univ.-Madison. Dept. of Soil Science.
W. A. Jury, and C. B. Tanner.
Agronomy Journal, Vol 67, No 6, p 840-842, November-December 1975. 2 fig, 7 ref.

Descriptors: *Advection, *Evapotranspiration, *Evaporation, Model studies, Radiation, Measurement, *Crop water requirements, *Net radiation, *Priestley-Taylor evaporation formula

The empirical formula of Priestly and Taylor (Mon. Weather Rev. 100:81-92, 1972) relating the evapotranspiration from a well-watered surface to the net radiation and a function of the air temperature is modified to include a saturation deficit term to account for high local advection. The model is tested on two seasons of daily evapotranspiration measurements over irrigated potatoes resulting in good agreement and a substantial improvement over the unmodified formula. Alfalfa measurements are also represented well by the model, but no better than by the Priestley-Taylor formula calibrated during a period of high advection. (Skogerboe-Colo St)
W79-02395

EVAPOTRANSPIRATION ESTIMATES FOR WATER RIGHT TRANSFERS,
Wyoming Univ., Laramie. Water Resources Research Inst
R. D. Burman, P. A. Rechard, and A. C. Munari.
In: Proceedings American Society Civil Engineers, Irrigation and Drainage Specialty Conference, Logan, Utah, Aug 13-15, 1975, p 173-195 (1975). 8 fig, 10 tab, 10 ref. OWRT B-003-WYO(5). 14-31-0001-3063.

Descriptors: *Evapotranspiration, *Water rights, *Water transfer, Irrigation, Streamflow, *Evapotranspiration estimates, *Blaney-Criddle method, Wyoming, Colorado, Nevada.

Current practice allows the transfer of seasonal evapotranspirtation minus effective rainfall when making a water right transfer from meadow irrigation to another use. This practice is equivalent to permitting the transfer of the effect of the meadow irrigation on streamflow. The Blaney-Criddle method is commonly used, with calculations made on a monthly basis. Estimates of evapotranspiration based on 15 methods were compared with measurements from four locations in Wyoming, Colorado, and Nevada. Monthly calculations were made using climatic data and lysimeter measurements. Inflow-outflow measurements made near Laramie were also used. Evapotranspiration was estimated for all months of data and for all sites. Without local calibration the Kohler, Nordenson and Fox method of estimating lake evaporation appears to be the most satisfactory method of estimating evapotranspiration from high-altitude native hay meadows. Using crop coefficients developed from Colorado, Wyoming, and Nevada, the Blaney-Criddle method appears to be the most satisfactory. Both the revised Blaney-Criddle and the Olivier methods appear to give reasonable estimates of streamflow depletion. For monthly calculations the Blaney-Criddle method with coefficients calibrated for mountain meadow conditions appears to yield satisfactory estimates
W79-02491

2E. Streamflow and Runoff

SOME COMPARISONS OF FLOOD STATISTICS IN REAL AND LOG SPACE,
Geological Survey, Reston, VA. Water Resources Div., and IBM Thomas J. Watson Research Center, Yorktown Heights, NY.
J. M. Landwehr, N. C. Matalas, and J. R. Wallis.
Water Resources Research, Vol 14, No 5, p 902-920, October 1978. 9 fig, 30 tab, 6 ref.

Descriptors: *Floods, *Historic floods, *Simulation analysis, *Monte Carlo method, *Stochastic processes, Evaluation, Real space, Log space.

Some statistics of historical and simulated flood data were examined in real and log space. Some statistical properties of floods in real space could not be inferred from those in log space without extensive knowledge of the distribution of floods in real space as well as information about its sampling characteristics. The construction and use of regional skew maps in log space are most likely counter productive. (Woodard-USGS)

FLOW CHARACTERISTICS OF STREAMS IN TUTUILA, AMERICAN SAMOA,
Geological Survey, Honolulu, HI. Water Resources Div.
I. Matsuoka.
Water-Resources Investigations 78-103 (open-file report), September 1978. 34 p, 7 fig, 1 plate, 6 tab, 13 ref.

Descriptors: *Streamflow, *Flow characteristics, *Low flow, *High flow, *Rainfall-runoff relationships, Hydrologic data, *American Samoa, *Tutuila.

The island of Tutuila is the economic and population center of American Samoa. It lies in the tropics and rainfall is abundant. Annual rainfall at upper Faga'alu reservoir averaged 207 inches during the period 1904-75. Available records show that altitude is a significant factor affecting the amount of rainfall. Small, steep basins generally yield perennial flow into streams but the amounts are small and sometimes highly variable. Low-flow frequency and correlation methods were used to determine flow characteristics. The total of the low-flow consecutive 7-day average discharges that can be expected at 10-year recurrence intervals at the 6 continuous-record gaging stations and the 45 partial-record stations analyzed is 5.2 cubic feet per second. About half of this total, 2.4 cubic feet per second, is from streams draining the southwestern part of the island where most of the water collection and distribution systems are being concentrated. High-flow frequency curves show the

instantaneous peak discharge of the maximum mean discharge for selected periods of consecutive days and its likelihood of occurrence. (Woodard-USGS)

FLOOD-PLAIN DELINEATION FOR CUB RUN BASIN, FAIRFAX COUNTY, VIRGINIA,
Geological Survey, Richmond, VA. Water Resources Div.
P. L. Soule.
Open-file report 78-17, 1978. 121 p, 78 fig, 12 tab, 4 ref.

Descriptors: *Flood profiles, *Flood plains, *Flood forecasting, *Flood frequency, *Analytical techniques, Design flood, Flood routing, Flood control, *Virginia, *Cub Run basin(Va), Fairfax County(Va), *Flood-plain mapping, *Flood-plain delineation.

Flood-plain delineation for Cub Run basin water-surface profiles of the 25-, 50-, and 100-year recurrence interval discharges have been computed for all streams and reaches of channels in Fairfax County, Virginia having a drainage area greater than 1 square mile except for Dogue Creek, Little Hunting Creek, and that part of the Cameron Run above Lake Barcroft. Maps having a 2-foot contour interval and a horizontal scale of 1 inch equals 100 feet have been used for base on which flood boundaries were delineated for 25-, 50-, and 100-year floods to be expected in each basin under ultimate development conditions. This report is one of a series and presents a discussion of techniques employed in computing discharges and profiles as well as the flood profiles and maps on which flood boundaries have been delineated for the Cub Run basin in Fairfax County. Most of the major rapids along the 450 km course of the Colorado River in the Grand Canyon are within fracture zones that run perpendicular to the river. Steep tributaries flowing within the zones of bedrock weakness move large debris to the Colorado, forming the rapids. Accelerated flow through the rapids scours the deep pools that are located below them. (Visocky-ISWS)

THE ORIGIN OF LABYRINTH AND TOWER KARST AND THE CLIMATIC CONDITIONS NECESSARY FOR THEIR DEVELOPMENT,
Georgia Univ., Athens.
G. A. Brook, and D. C. Ford.
Nature, Vol 275, No 5680, p 493-496, October 12, 1978. 3 fig, 2 tab, 43 ref.

Descriptors: *Karst, *Canada, *Climates, Limestone, Dolomite, Humid climates, Subarctic, Karst hydrology, Erosion, Zoning, *Labyrinth karst, Tower karst, Karstlands, Nahanni karst, Natural rock labyrinths, Zonal climate.

A complex and accentuated karstland at 61-62 deg N in the Nahanni area of the Mackenzie Mountains, Northwest Territories, Canada, was explored and studied in 1972-74. The climate is subarctic, continental interior type, and there is a discontinuous permafrost. The findings added knowledge of karst styles and suggested that some relationships between karst morphology and climate be reassessed. A new karst style, labyrinth karst, was recognized in climates ranging from humid tropical to subarctic. These karst landscapes were identified in several humid and seasonally humid tropical carbonate terrains such as southwest Celebes, Indonesia, the Star Mountains and Lake A jamuru regions of New Guinea, and the Tanga region of Tanzania. They also were clearly visible in oblique photographs of the Sierra Maestra in Cuba and Arnhem Land, Northern Territory, Australia. In the late stages of evolution, labyrinth karst was replaced by limestone towers. This indicates that tower karst is polygenetic and not specific to the humid tropics as was once thought. GEOLOGY AND GROUNDWATER RESOURCES OF NORTHERN BERKS COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
C. R. Wood, and D. B. MacLachlan.
Pennsylvania Geological Survey, Harrisburg, Fourth Series, Water Resources Report 44, 1978. 91 p, 9 fig, 2 plates, 14 tab, 37 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Groundwater availability, *Water quality, Water utilization, Water wells, Water yield, Water level fluctuations, Surface-groundwater relationships, Groundwater recharge, Transmissivity, *Pennsylvania, Berks County(Penn).

The area of investigation is underlain chiefly by carbonate rocks in the south and by shale and graywacke in the north. Ground water is almost entirely confined to secondary openings that occur along bedding planes, faults, and other fractures. Yields of 1,000 gal/min are common in the better carbonate aquifers. Nondomestic wells in some of the poorer carbonate aquifers have median yields of less than 60 gal/min. Median yields of nondomestic wells in the noncarbonate aquifers generally range from 25 to 250 gal/min. Natural annual fluctuations of water levels in wells generally range from 3 to 20 feet. Areas of low water-level slope underlain by carbonate rocks generally coincide wtih areas of high transmissivity. Two areas of fluoride pollution result from soluble industrial wastes. Industrial wastes containing chromium polluted the water at Sinking Spring; and an area near Sinking Spring that was polluted by a gasoline spill in the early 1930's remains polluted in 1976. (Woodard-USGS)

MAJOR AQUIFERS IN CLARK COUNTY, SOUTH DAKOTA,
Geological Survey, Huron, SD. Water Resources Div.
L. J. Hamilton.
South Dakota Geological Survey, Vermillion, Information Pamphlet No. 16, 1978. 7 p, 5 fig, 1 tab.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *Groundwater availability, *Water utilization, Hydrologic data, Water wells, Water yield, Water levels, Chemical analysis, South Dakota, *Clark County(SD).

This information pamphlet is one of a series of reports on water-resources studies of South Dakota counties. It is designed to acquaint the reader with the general distribution, quantity, and quality of ground water available from the major aquifers in Clark County. The information is based on data collected by the U.S. Geological Survey and the South Dakota Geological Survey during the period 1973-76. Some of the physical and hydrochemical properties of six major glacial aquifers are summarized in the table. Three of the aquifers are grouped as the Prairie Coteau aquifers and the other three are grouped as the Altamont aquifers. Although most of the water in the Prairie Coteau aquifers and the Altamont aquifers is saline it has been a satisfactory supply for human and livestock consumption. The water may require treatment for other uses in order to reduce high concentrations of iron, manganese, and hardness. (Woodard-USGS)

O. Malvik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 707, Price code: A06 in paper copy, A01 in microfiche. M. A. Thesis, 1977, 102 p. 24 fig, 3 tab, 29 ref, 6 append. OWRT A-097-MO(2), 14-34-0001-7053 and 7054.

Descriptors: *Aquifers, *Missouri, *Groundwater sources, Groundwater, *Geophysical exploration, *Glacial aquifers, Bedrock, *Seismic refraction, *Gravity survey, Aquifer characteristics.

Buried glacial and preglacial river valley aquifers represent the major untapped ground-water resource in northwestern Missouri. Ground-water exploration and development is hindered by scarce well log data, variable glacial drift thickness, and encroachment of saline water from the cyclical Pennsylvanian sedimentary bedrock. A multiple geophysical approach was used to delineate the incised river valleys and to make inferences on ground-water quality. Computer display of gravity residuals was used to select areas for further investigation. Gravity profiling was used to define the shape of the channel and the position of its maximum depth. Seismic refraction and resistivity soundings were then used to further evaluate the buried valleys. The interpretations of the gravity residual map were complicated by saddles between gravity lows, and some suspected buried valley locations were not verified by further geophysical investigation. Gravity surveys, however, appear to be an effective reconnaissance tool in this area. Seismic refraction gave adequate drift-bedrock interface depths where well control was available, indicating that a velocity contrast exists in the study area. Resistivity sounding has been effective in sites where adequate resistivity contrasts exist between drift and bedrock. In other sites saline water encroachment or shallow fresh water aquifers may mask this interface. This three-fold geophysical evaluation appears to be effective in this area whereas any one approach would, by itself, be of little value.

FLOTATION OF FRESH WATER ON SEA WATER, A HISTORICAL NOTE,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
S. N. Davis.
Ground Water, Vol. 16, No. 6, p 444-445, November-December, 1978. 8 ref.

Descriptors: *Hydrogeology, *History, *Ghyben-Herzberg, Saline water intrusion, Freshwater, Sea water, Floating.

The historical development of the Ghyben-Herzberg principle is outlined. It was first stated by Pliny the Elder A. D. 23-79 that fresh water floats on salt water due to differences in density. However, owing to illogical statement on other matter his influence on contemporary and later thought was weak. Joseph DuCommun should receive credit for the first clear scientific explanation of the floatation of fresh ground water on sea water. DuCommun's work antedated publications by both Badon Ghyben and Herzberg by more than 60 yers. Darwin inferred the principle in writing about shallow wells which recovered fresh water from small oceanic islands in 1845. Thus, the use of the term, Ghyben-Herzberg principle tends to perpetuate an incorrect understanding of an important step in the history of hydrogeology. An impersonal term such as 'the principle of static fresh-water floatation' should be substituted. (Purdin-NWWA)

FOSSIL GROUND-WATER GRADIENTS IN ARID REGIONAL SEDIMENTARY BASINS,
Birmingham Univ. (England). Hydrogeology Section.
J. W. Lloyd, and M. H. Farag.
Ground Water, Vol. 16, No. 6, p 388-393, November-December 1978. 5 fig, 1 tab, 16 ref.

Descriptors: *Groundwater movement, *Hydraulic gradient, *Arid lands, *Resistance networks, *Sedimentary basins(Geologic), Permeability, Specific yield, Carbon radioisotopes, Analog models, Groundwater resources, Groundwater recharge, Model studies, *Groundwater gradients, *Fossil gradients, Recharge mounds.

The hypothesis that present-day groundwater gradients in arid regional sedimentary basins are a decay feature of very old recharge mounds was examined using a resistance network analog. A longitudinal section model of a conceptual basin with some specific control of aquifer permeability and groundwater age was used. With reasonable combination of aquifer permeability and specific yield, it was shown that an acceptable head decay could have occurred over the past 10,000 years to produce the present-day gradient. In the model adopted, decreasing permeability with depth was found to be required to accord with 14C groundwater age data. Although the model is not considered to be definitive for any particular aquifer, the results showed that fossil gradient conditions could exist in the regional basins for long periods and should be taken account of in groundwater resources assessments. LONG-PERIOD GROUND-WATER REGIME IN THE EXCESSIVELY WET ZONE OF THE EUROPEAN USSR,
E. A. Zal'tsberg.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 64-67, 1977. 1 fig, 1 tab, 7 ref. Translated from News of the All-Union Geographic Society (Izvestiya VGO), Vol. 19, No. 2, p 137-142, 1977.

Descriptors: *Groundwater, *Water level fluctuations, *Water table, *Frequency analysis, Hydrogeology, Cycles, Wet climates, Analysis, Analytical techniques, Statistical methods, Foreign research, Foreign countries, Time, Groundwater resources, *USSR.

Investigated is the relatively little known problem of the long-period cyclicity (periodicity in a particular case) of the groundwater regime in the excessively wet zone of the European USSR. Various methods are used to identify the cyclic (periodic) components in long-period observations, namely: construction of difference-integral curves, smoothing from moving n-year periods, and correlation, harmonic, and spectral analyses. The results of harmonic analysis and some additional data on the cycles were tabulated. Long-period fluctuations in the levels of ground and surface waters have the same main cause, i.e., cyclic climatic variations. Therefore, there is a definite similarity between these fluctuations. Having identified some cycle in long meteorological or surface water observation series, one can state with great probability that a cycle of the same (or close) duration must also be manifest in groundwater fluctuations. Three-year cycles of high amplitude, found in the fluctuations of the pre-spring groundwater level minima, are as distinctly revealed in winter air temperature series, according to the Lenigrad meteorological station. Consequently, the characteristics of the frequency structures of series of regime-forming factors are reflected in the frequency structure of groundwater level series. Periods of different duration (generally cycles), identified in groundwater level fluctuations, are caused to some extent by individual regime-forming factors and by the simultaneous effect of the combination of these factors. AN EVALUATION OF ISOTOPE CONCENTRATIONS IN THE GROUND WATER OF SAUDI ARABIA,
Geological Survey, Riyadh (Saudi Arabia). Water Resources Div
W. J. Shampine, T. Dincer, and M. Noory.
In: Proceedings of the International Symposium on Isotope Hydrology, held in Neuherberg, Federal Republic of Germany, June 19-23, 1978. 16 p, 9 fig, 2 tab, 16 ref.

Descriptors: *Groundwater, *Water quality, *Stable isotopes, *Dating, *Aquifers, Foreign countries, Deuterium, Tritium, Groundwater movement, Groundwater resources, Evaluation, Reviews, *Saudi Arabia, Umm-Er-Radhuma aquifer, Wasia aquifer, Neogene aquifer, Khobar aquifer, Oxygen-18, Sulfur-34, Carbon-13, Carbon-14.

Data on concentrations of oxygen-18, deuterium, tritium, sulfur-34, carbon-13, and carbon-14 have been collected in varying amounts from groundwater samples at more than 400 sites in Saudi Arabia. These data were collected during several hydrologic studies conducted in Saudi Arabia since 1967, most of which studied selected areas of the Arabian Shelf area of the kingdom. No new data were collected for this study, but all of the hydrologically oriented isotope data available in the kingdom have been compiled and summarized. A general assessment of the data is made which is useful to evaluate the quantity and quality of the data available as well as to indicate potential areas for future work. The compiled data also have permitted a general evaluation of the isotopic characteristics of the water in large, regional aquifer systems (about 800,000 sq km). (Woodard-USGS)

DISAPPEARANCE OF NITRATE UNDER TRANSIENT CONDITIONS IN COLUMNS OF SOIL,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
H. E. Doner.
Soil Biology and Biochemistry, Vol. 7, No. 4-5, July 1975. p 257-259. 3 fig, 8 ref.

Descriptors: *Nitrates, *Flow rate, Soil investigations, Soil chemistry, Leaching, Soil texture, Nitrogen, *Soil columns, *Transient flow conditions(Soils).

Previously a rapid reduction of NO3 was obtained in soil columns with continuous flow, before the establishment of steady state conditions. This initial behavior was not a function of flow rates. In order to determine what influence NO3 concentrations might have on transient and steady state rates, of NO3 loss, small soil columns were infiltrated with 0, 100 and 1000 micrograms ml(-1)NO3-N and the effluents were analyzed daily for NO3 and NO2. STREAMING-POTENTIAL EFFECTS IN SATURATED WATER FLOW THROUGH A SAND-KAOLINITE MIXTURE,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
S. Gairon, and D. Swartzendruber.
In: Ecological Studies. Analysis and Synthesis. Vol. 4, Edited by A. Hadas et al. Springer-Verlag Berlin - Heidelberg - New York p 141-151, 1973, 6 fig, 1 tab, 14 ref. OWRT B-005-IND(3).

Descriptors: Flow, *Saturated flow, *Porous media, Electrical properties, Electric fields, Sand, Kaolinite, *Streaming potential, *Electrical Potential difference.

The electrical potential difference across a permeameter filled with a mixture of 12.5% kaolinite and 87.5% sand was measured for saturated flow of water containing 20 ppm of mercuric chloride. Measurements were taken continuously for alternate periods of rest and flow ranging from as small as 15 min to as large as 24 hr. Both silver-silver-chloride and bright plantinum electrodes were placed in the end reservoirs of the permeameter to obtain electrical measurements, and the entire flow apparatus was enclosed in a grounded copper-screen Faraday cage. Even so, electrical potential differences observed continuously over 24-hr periods showed considerable variation with both types of electrodes. The only consistent response, qualitatively and quantitatively, was the step change in electrical potential at the time of initiation or cessation of hydraulic flow. The direction and magnitude of this 'E step' were consistent with those of the streaming-potential phenomenon. The magnitude of the E step was essentially proportional to the hydraulic gradient causing the liquid flow, and was thus in conformity with classical double-layer theory. Water flux also was closely proportional to the hydraulic gradient.

THE NATURE OF BASALT WEATHERING IN ISRAEL,
Hebrew Univ., Jerusalem, Rehovoth (Israel). Dept. of Soil and Water Science.
A. Singer.
Soil Science, Vol. 125, No. 4, p 217-225, April, 1978. 5 fig, 17 ref.

Descriptors: *Weathering, Soil formation, *Basalts, Aeolian soils, Saprolites, Clay minerals, Quartz, *Israel

Three major weathering forms of upper Cenozoic basalts are recognized: a weathering crust, several millimeters thick, at the interface with the massive basalt; a weathering zone, several centimeters thick, associated with vesicular basalt; and thoroughly altered basalt saprolite, mostly obtained under prolonged water-saturated conditions. The clay fractions in the weathering crust and zone consist of smectite and kaolinite with halloysite, while, in the saprolite, smectite is the only clay mineral formed. Si02/A1203 ratios change from 6-7 in the rock to 2-3 in the crust clay, and this decrease represents maximum desilication obtained under eastern Mediterranean conditions. With soil development, a resilication of soil clays relative to crust clay may take place in the deeper stable profiles. Soil development also involves aeolian accumulation of quartz in the coarser size fractions, and Fe and K enrichment in the clay fraction. Grumusols (Vertisols) represent the mature, stable end products of basalt weathering on uneroded surfaces in the semiarid and subhumid parts of the eastern Mediterranean. In the more humid parts, Red and Brown Mediterranean soils (Xeralfs) become dominant. (Skogerboe-Colorado State)

MATERIAL CONTENT OF BINARY PHYSICAL MIXTURE AS MEASURED WITH A DUAL-ENERGY BEAM OF GAMMA RAYS,
Purdue Univ., Lafayette, IN. Dept. of Agronomy.
D. L. Nofziger, and D. Swartzendruber.
Journal of Applied Physics, Vol 45, No 12, p 5443-5449, December 1974. 6 fig, 1 tab, 15 ref. OWRT B-014-IND(8).

Descriptors: *Instrumentation, *Soil moisture meter, *Gamma rays, Soil moisture movement, Equipment, Cesium, *Dual-energy beams, Soil moisture measurement, Soil density, Americium.

The content of water and soil in physical intermixture was measured simultaneously and nondestructively by the attenuation of a dual-energy beam of gamma rays. The beam, 1 mm by about 3 cm in cross section, was devised by placing a 280-mCi source of 137Cs behind a 389-mCi source of 241Am, with lead collimators suitably aligned in front of each source and the scintillation probe. The probe was connected in parallel to two-separate amplifier-analyzer-scaler systems, one being set in the integral mode to receive all pulses greater than 550 keV (for 137Cs, 662-keV peak), with the other being set in the differential mode to receive all pulses in a band 35-85 keV (for 241Am, 60-keV peak). When related to the count intensity in the high-energy range, the count intensity caused by 137Cs in the low-energy band was empirically found to be independent of the material in the binary mixture (soil and/or water) placed in the beam for measurement. Also, e could be well expressed by a cubic polynomial that was then used along with a dead-time correction to determine the attenuated count intensity attributable to the 241 Am source alone. Calibration of the system was then possible. Over-all measuring accuracy was on the order of plus or minus 0.01 cm3/cm3 in water content and plus or minus 0.04 cm3 or g/cm3 for a counting period of 5 sec.

ELECTRICAL POTENTIALS DURING WATER ENTRY INTO AN AIR-DRY MIXTURE OF SAND AND KAOLINITE,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
D. Swartzendruber, and S. Gairon.
Soil Science Vol. 120, No. 6, p 407-411, 1975. 4 fig, 3 ref. OWRT B-005-IND(4).

Descriptors: *Water flow, *Saturated flow, *Porous media, Electrical properties, Electrical fields, Sand, Kaolinite, Seepage, *Streaming potential, *Electrical potential difference.

Electrical potentials were observed for the upward entry of water into columns of air-dry mixtures of sand and kaolinite. The electrical potential difference was measured between two bright platinum electrodes, one being in the water chamber at the inlet (lower) end of a column, and the other being one of five separate electrodes placed in the sand-kaolinite at various positions along the column. Time records of electrical potential at the various electrodes, obtained with a high-resistance electrometer and a strip-chart recorder, exhibited characteristic negative peaks that could be very closely associated with the arrival of the visual wet front at the various electrodes. Thus, although the observed electrical potentials cannot be used to infer streaming potentials for the unsaturated flow process of water entry into air-dry soil, it does appear that such potentials can be used to trace quantitatively the progress of a wet front through the soil, under circumstances wherein visual observations are not possible or feasible.

REDUCTION OF NITRATE IN A SOIL COLUMN DURING CONTINUOUS FLOW,
California Univ., Berkeley. Dept. of Biology.
M. S. Ardakani, L. W. Belser, and A. D. McLaren.
Soil Science Society of America Proceedings, Vol. 39, No. 2, p 290-294, March-April 1975. 5 fig, 21 ref.

Descriptors: *Nitrates, *Denitrification, Soil environment, Soil investigations, Bacteria, Soil tests, Soil bacteria, Soil chemistry, Loam, Nitrogen, *Soil columns. Nitrate-nitrogen.

A column packed with a homogeneous Hanford sandy loam soil was perfused continuously with a solution containing 200 ppm NO3(-)-N and 2400 ppm glucose-C. Weekly estimates of denitrifiers showed that populations increased from 10(2) to > 10(8)/g of soil. Denitrifiers were most abundant near the surface where NO3(-)-N almost totally disappeared from the soil solution. An organic matter profile characterized by a surface layer developed within 3 weeks. Accumulated organic N accounted for about 4% of the total applied NO3(-)-N while the remaining 96% disappeared, presumably by dissimilation, within the top 0.5 cm of the surface layer. Normalized rate constants from 1.2 times 10(-5) ppm/hour cm3 per organism were estimated for dissimilation of NO3(-)N from its profiles. In a similar experiment, but without added glucose, less of the NO3(-)-N disappeared from solution; the percentage decreased from 40 to 15% with time. (Skogerboe-Colo St)

MODEL FOR DECOMPOSITION OF ORGANIC MATERIAL BY MICROORGANISMS,
Utah State Univ., Logan. Ecology Center.
H. Parnas.
Soil Biology and Biochemistry, Vol 7, No 2, p 161-169, March 1975. 8 fig, 1 tab, 11 ref.

Descriptors: *Model studies, *Decomposing organic matter, Organic matter, *Microorganisms, Soil investigations, *Microbial degradation, *Mineralization.

A theoretical model which gives the rate of microbial decomposition of organic material (plant or animal residues, or soil organic matter) is presented. Explicit equations for the rate of decomposition, mineralizations, and immobilization are given. The main assumption of the model is that the rate of decomposition of any substrate is proportional to the growth rate of its decomposers. Some results of the model are: (1) Addition of extra nitrogen to materials poor in nitrogen increases their rate of decomposition; (2) Addition of extra nitrogen to a substrate whose initial carbon/nitrogen ratio is above a critical ratio (20-30) causes a decrease in the substrate's carbon/nitrogen ratio during its decomposition; (3) If the initial carbon/nitrogen ratio is below the critical one, no change in the substrate's ratio will occur with time. All the model results are analytical and independent of the values for the various parameters. Nevertheless the application of the model to real field conditions is discussed while presenting a numerical example. (Skogerboe-Colo St)

FIELD PERSISTENCE AND MOVEMENT OF TRIFLURALIN IN TWO SOIL TYPES,
Tennessee State Univ., Nashville.
D. R. Duseja, and E. E. Holmes.
Soil Science, Vol 125, No 1, p 41-48, January, 1978. 1 fig, 8 tab, 27 ref.

Descriptors: *Herbicides, Weed control, Weeds, Johnson grass, Oats, Movement, Persistence, Trifluralin, Soil types.

Trifluralin (alpha, alpha, alpha-trifluoro-2, 4, dinitro-N, N-dipropyl-p-toluidine) was applied in 1973 to Egam load and Beason clay field plots. Trifluralin persistence and movement in both soils was essentially the same, even though higher herbicide rates were applied to Beason clay, according to manufacturer's recommendations. There was an increasing trend of herbicide residues with excessive rates of trifluralin application. The herbicide essentially dissipated from soils in 5 months, with only 2.1 percent and 0.4 percent of the initially applied amounts remaining in the soil profile, in the Egam and Beason soils, respectively, at the highest (two times) rate of herbicide application. No herbicide was detected in the soil the following spring (11 months after application). Herbicide persistence could be described by a first-order kinetics. Downward movement of trifluralin under the conditions of this experiment did occur to the 8 in depth; further penetration of herbicide was essentially nil. Apparently, upward movement of trifluralin also occurred under these conditions. The control of Johnson grass and two broadleaf weed species present in the soil lasted from four to five weeks only. EFFECTS OF TEMPERATURE AND TIME ON HYDROXY ALUMINUM PHOSPHATE-MONTMORILLONITE COMPLEX,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
M. D. Webber.
Soil Science, Vol 125, No 2, p 107-114, February, 1978. 3 fig, 3 tab, 16 ref.

Descriptors: *Montmorillonite, *Aluminum, *Phosphates, *Clay minerals, Temperature, Time, Solubility, Suspension, Aerobic conditions, Acidic soils.

Hydroxy aluminum phosphate-montmorillonite complex persisted for 320 days in aqueous aerobic suspensions that exhibited a pH range of 2.5 to 3 and were maintained at 10, 25, and 35C. There were small changes in its chemical and x-ray diffraction properties with time, and these occurred more quickly as the temperature was raised. It persisted for 100 to 200 days at 50C, but then variscite formed and interlayer material disappeared from the clay. Solubility calculations indicated that preparations containing the complex were undersaturated with respect to gibbsite and supersaturated with gibbsite, but saturated with variscite. Seeding the preparations with variscite and aging at 25C did not cause variscite to form. It is postulated that amorphous hydroxy aluminum phosphate, which is an important soil-fertilizer reaction product and a good source of phosphorus for plants on neutral soil, is likely to persist indefinitely in temperate acid soils. WATER INFILTRATION INTO UNIFORM AND STRATIFIED SOILS I. REVIEW AND USE OF AN APPROXIMATE THEORY,
Purdue Univ., Lafayette, IN. Dept. of Agronomy.
M. Asseed, and D. Swartzendruber.
The Libyan Journal of Agriculture, Vol 3, p 19-26. 1974. 2 fig, 20 ref. OWRT A-004-IND(7).

Descriptors: *Water infiltration, *Water content, *Hydraulic conductivity, *Unsaturated flow, Diffusivity, Conductivity, Soil water movement, Least squares method, Approximation method, Soil horizon, *Green-Ampt Equation, *Approximate theory, Soil strata

The equations of the approximate infiltration theory of Green and Ampt are much simpler than the mathematical forms of the diffusivity-conductivity theory of soil-water movement, and also involve parameters of characterization that are easier to measure experimentally. For cumulative water infiltrated into uniform soil as a function of time, these parameters are: the initial water content of the soil, the constant mean water content behind the wet front, a soil constant akin to the hydraulic conductivity of nearly saturated soil, and an equivalent constant head of water arising from the capillary properties of the soil. For fitting of the Green and Ampt equation to experimental infiltration data, a least-squares approach was developed, and was found to work very satisfactorily for measurements made on sand-silt mixtures. The approximate theory was applied to infiltration into stratified soils, thus involving the parameters of characterization of each stratum. Analysis was carried out for two and three strata, and can be continued for as many strata as desired. The resulting equations, however, become increasingly complicated, especially for the larger values of time at which the wet front has advanced into successively deeper strata. (See also W79-02493)
W79-02492

WATER INFILTRATION INTO UNIFORM AND STRATIFIED SOILS II. EXPERIMENTAL EVALUATION OF AN APPROXIMATE THEORY,
Purdue Univ., Lafayette, IN. Dept. of Agronomy.
M. Asseed, and D. Swartzendruber.
The Libyan Journal of Agriculture, Vol 4, p 129-140, 1975. 5 fig, 4 tab, 6 ref. OWRT A-004-IND(8).

Descriptors: *Water infiltration, *Water content, *Hydraulic conductivity, *Unsaturated flow, Diffusivity, Conductivity, Soil water movement, Least squares method, Approximation method, Soil horizon, *Green-Ampt equation, Approximate theory, Soil strata.

Downward infiltration of water into laboratory flow columns was studied experimentally for two different sand-silt mixtures designated as 'coarse' and 'fine' Data were taken to assess the validity of infiltration equations derived by the Green and Ampt approach for both uniform and stratified columns. For uniform columns, the equation for cumulative water infiltrated versus time accommodated the experimental data very well, and was fitted by least squares. Two characterizing constants are C, which is akin to a hydraulic conductivity, and P, which arises from the capillary of the porous material. Although both C and P exhibited as much as a 2-fold variation for a given material, their respective mean values distinguish very well between the coarse and fine mixtures and also provided the correct sense of C being markedly

smaller for the fine material than for coarse, and of P being larger for fine material than for coarse. For stratified columns, the corresponding equations were tested by predicting cumulative water infiltration versus time, based upon the parameters C and P determined from uniform columns. These predictions agreed reasonably well with the direct measurements on the stratified columns, with one exception for a fine-over-coarse stratification after the wet front had penetrated into the coarse substratum relatively deeply in comparison with the thickness of the fine upper stratum. VEGETATION CHANGES IN A SMALL MICHIGAN BOG FROM 1917 TO 1972,
Michigan Univ., Pellston. Biological Station.
C. R. Schwintzer, and G. Williams.
The American Midland Naturalist, Vol 92, No 2, p 447-459, October, 1974. 2 fig, 2 tab, 17 ref.

Descriptors: *Vegetation, *Bogs, *Succession, *Michigan, Flooding, Drainage, Water levels, Weather patterns, Trees, Mortality, Marshes, Wetlands, Bog forest, Chamaedaphne.

Quantitative descriptions of the vegetation and maps of the pool of Bryant's Bog are available for several years since 1917 providing an opportunity for direct observations of bog succession. The vegetation advanced into the bog pool in an irregular manner at an average rate of 2.1 cm/year. In 1972 the pool was 76% of its extent in 1926. The vegetation changed in a successional series from the Chamaedaphne association of 1917 to the high bog-shrub association in the dry years of the 1920's to a bog forest which was well established in the late 1960's. It regressed in the early 1970's when many of the trees died and the Chamaedaphne association appeared to be re-establishing itself. The most probable cause of tree mortality was flooding caused by exceptionally high water levels due to natural weather cycles. Tree mortality was also found in Hoop Lake Bog - which, like Bryant's Bog, lacks aboveground drainage - while none occurred in bogs with aboveground drainage. (Maroncelli-Mass)

AQUATIC INVERTEBRATE ABUNDANCE IN RELATION TO CHANGING MARSH VEGETATION,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
D. K. Voigts.
The American Midland Naturalist, Vol. 95, No. 2, p 313-322, April, 1976. 1 fig, 1 tab, 28 ref.

Descriptors: *Aquatic animals, *Invertebrates, *Marsh plants, *Waterfowl, Wildlife, Crustaceans, Gastropods, Aquatic insects, Nesting, Aquatic vegetation, Rooted aquatic plants, Freshwater plants, Vegetation, Submerged plants, Floating plants, Marshes, Iowa, Emergent vegetation, Avian nesting, Avian nesting season.

The relationship between invertebrate populations and vegetative cover was studied in several Iowa marshes during the peak of the avian nesting season. Shallow water with emergent and floating dead vegetation produced the most isopods, planorbid snails and physid snails. Physid snails had another abundance peak in areas where submerged plants were found below dense free-floating plants. Midges reached greatest abundance in more open habitats somewhat protected from the wind. Amphipods were the most numerous invertebrate taxa and were most abundant in dense beds of submerged vegetation. Cladocera and copepods were most common in quiet pools with little vegetation. Total invertebrate abundance increased as the emergent vegetation was replaced by submerged vegetation, but maximum numbers occurred where beds of submerged vegetation were interspersed with stands of emergent vegetation. It is suggested that nesting marsh birds are attracted to marshes that produce the most invertebrates. (Maroncelli-Mass)

GEOGRAPHIC VARIATIONS IN SALT MARSH MACROPHYTE PRODUCTIONS: A REVIEW,
Louisiana State Univ., Baton Rouge. Dept. of Marine Sciences.
R. E. Turner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 795, Price codes: A02 in paper copy, A01 in microfiche. Sea Grant Reprint No. LSU-R-76-015, 1976. Reprinted from: Contributions in Marine Science, Vol. 20, p 47-68, 1976. 9 fig, 7 tab, 74 ref.

Descriptors: *Primary productivity, *Rooted aquatic plants, *Atlantic coastal plain, *Gulf coastal plain, *Reviews, Aquatic plants, Wetlands, Marshes, Biomass, Spartina alterniflora, Over-wintering biomass, Reviews, Bibliographies.

A literature review of salt marsh macrophyte production measurements supports the conclusion of a north-south gradient which parallels solar energy inputs at a 0.20-0.35% net conversion efficiency. There is also a latitudinal gradient of live biomass which over-winters. Considerable variation exists within and among marshes. Methods previously employed to measure salt marsh macrophyte production have generally under estimated the actual net above-ground production because of an inability to account for the turnover of live material between sampling periods. Turnover apparently increases with decreasing latitude and may be equal to annual changes in standing live biomass. The effect of other factors influencing production are discussed and a detailed data review presented. (Stihler-Mass)

WATER LEVEL FLUCTUATION IN A NORTHEASTERN ONTARIO PEATLAND,
Toronto Univ. (Ontario). Dept. of Botany.
T. S. Dai, V. F. Haavisto, and J. H. Sparling.
Canadian Journal of Forest Research, Vol. 4, No. 1, p 76-81, March, 1974. 5 fig, 13 ref.

Descriptors: *Water level fluctuations, *Bogs, Wetlands, Fen, Water levels, Runoff, *Peatlands, *Ontario, *Canada.

Depths to water level and changes due to local climate were dissimilar in five peatland conditions--kale surface, black spruce bog, stagnant spruce site, lagg area, and poor fen. The deepest water level and the greatest fluctuations occurred in the ombrotrophic black spruce bog. The sedge-dominated poor fen site was submerged following every heavy rain; waterlogged conditions remained with 6 cm of the surface at all times because of the influence by the water level of Dai Lake. Water level of the lagg site was above the surface following every heavy rain during a 12-day period in early August. This site was affected by continuous inflow, high water levels, and fast runoff, therefore, a large flucutation of water level prevailed at this site. The water level of Dai Lake varied with a narrow range because the loss of water was primarily dependent on slow seepage and evaporation. Lowest water level during the summer of 1967 was recorded on July 11 at every site. (Stihler-Mass)

THE PRODUCTIVITY OF LAKE CHAMPLAIN WIT REGARD TO WATERFOWL, FURBEARERS, AND OTHER WILDLIFE,
Vermont Dept. of Fish and Game, Montpelier.
T. R. Myers, and D. D. Foley.
Prepared under contract to Fish and Wildlife Service, Newton Corner, Massachusetts, for the International Joint Commission, August, 1977. 175 p, 7 fig, 55 tab, 281 ref. 14-16-0005-6056.

Descriptors: *Wetlands, *Lakes, *Wildlife habitat, *Water level fluctuations, Wildlife, Waterfowl, Water levels, Reservoir management, Furbearers, Aquatic animals, Marsh plants.

Of concern to waterfowl, furbearers, and other wildlife dependent upon wetland habitat along Lake Champlain is the potential for loss or drying out of wetlands as a direct result of proposed lake level regulation. From the stage-area information generated from the study, it is significant that substantial acreages of productive wetlands lie at contour intervals above maximum spring high limits allowed under regulation plans being considered. Should these areas receive no further periodic inundation, they would fall to retain their wetland charcter and revert to terrestrial vegetative types. The end product would be a vastly diminished wetland resource adjacent to Lake Champlain with considerable adverse impact on higher and lower life forms dependent on this wetland complex. Composition and quality of remaining wetland habitat could be substantially different with regard to meeting wildlife needs. (Steiner-Mass)

APPARENT USE OF SEDIMENT NITROGEN AND PHORPHORUS BY PLANTS IN MALLETTS CREEK MARSH WITH IMPLICA-

TIONS TO LAKE CHAMPLAIN WATER LEVEL REGULATION,
Geological Survey, Albany, NY.
J. T. Turk.
Prepared under contract to Fish and Wildlife Service, Newton Corner, Massachusetts, for the International Joint Commission, August, 1977. 19 p, 10 fig, 10 tab, 9 ref.

Descriptors: *Nitrogen, *Phosphorus, *Marsh plants, Wetlands, Marshes, Freshwater marshes, Rooted aquatic plants, Nutrients, Nutrient cycling.

Nitrogen and phosphorus dissolved in the interstitial water of the marsh sediments are a significant source of nutrients for rooted macrophytes and are capable of supplying 42 and 9 percent, respectively, of the plant requirements. During periods of low surface-water input in mid- and later-summer, interstitial nitrogen and phosphorus may supply an even larger percentage of the plant nutrient requirements. Excessive fluctuations in water level in the spring or early summer could increase the supply of nitrogen and phosphorus to Lake Champlain and decrease the growth of rooted macrophytes within the marsh. Seventeen Ohio lakes were evaluated in 1975 for water quality status. Spring and late summer data included physical and profile measurements for a broad spectrum of chemical and biological constituents. Secchi disk transparency ranged from 0.1 to 2.9 meters. Thermal stratification or stability is shown for 10 lakes deeper than 4.6 meters. Anaerobic conditions, and high concentrations of ammonia, carbon dioxide, and hydrogen sulfide, developed in all thermally stabilized lakes. Maximum dissolved oxygen was measured at 20.8 milligrams per liter (229 percent saturation) in Paint Creek Lake. Calcium was the dominant and (or) codominant cation and bicarbonate and (or) sulfate the dominant anions in all lakes sampled. Two lakes, Hope and Vesuvius, had soft water. Specific conductance ranged from 128 to 510 micromhos. Pesticides were not detected except in Action Lake, and concentrations of one or more trace metals were above State limits in 10 lakes. Fecal coliform counts were generally low and exceeded 400 colonies per 100 milliliters in four lakes during runoff events. Blue-green algae dominated the summer phytoplankton communities in 16 lakes, with maximum densities greater than two million cells per milliliter. (Woodard-USGS)

TRACE ELEMENT OF THE SARDIS RESERVOIR, MISSISSIPPI, AS RELATED TO CLAY MINERAL DISPERSION,
Mississippi Univ., University. Dept. of Geology and Geological Engineering.
W. R. Reynolds.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 705. Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University, Mississippi State. Report October 1978, 62 p, 12 fig, 13 tab, 26 ref. OWRT A-115-MISS(1), 14-34-0001-8026.

Descriptors: *Reservoirs, Sedimentation, Geochemistry, *Trace elements, *Distribution patterns, Migration, Profiles, *Sediment distribution, Sediments, *Geochemistry adsorption, Surfaces, Sorption, Expansive clay, *Clay minerals, Sediments, Reservoirs, Illite, Kaolinite, Montmorillinite, Cation adsorption, *Mississippi, *Sardis Reservoir(Miss), *Bottom sediments.

Bottom sediment of Sardis Reservoir which is located in Northcentral Mississippi has a mineral composition as determined by x-ray diffraction of quartz, feldspar, calcite and the clay minerals montmorillonite, kaolinite and illite. The clays together are the dominant fraction of which kaolinite is the dominant species. Trace element content is restricted to the clay fraction and includes Mg, Zn, Ni, Ca and Fe. Lead and copper were also detected but only in a few samples. Concentrations of trace elements were determined by atomic absorption spectrophotometry. Entropy ratio mapping of sediment mineralogy revealed nearly complete mixing of all minerals, especially those of the clay group. Multiple regression analysis of trace element composition suggested natural contribution only from multiple land sources with complete mixing for some elements and spastic mixing for others in the reservoir proper. Summer thermal stratification of Sardis water controls only the deposition of iron. Otherwise, the depositional behavior of the remaining elements can mostly be related to the dispersion of clay. High and equal covariance was found between Mg, Zn, and Fe (winter deposition only) which indicates identical behavior. Furthermore, there is excellent correlation between these elements and montmorillonite. Moderate correlation was found between Ni and kaolinite. Calcium, however, could not be related to any of the clay species. Finally, there was no evidence for a relation between illite and any of the trace elements

HYDROLOGIC BUDGET MODEL,
Florida University, Gainesville, Department of Environmental Engineering Sciences and Center for Wetlands
F. C. Wang, and K. Heimburg.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 68-109, 1976. 17 fig, 15 tab.

Descriptors: *Swamps, *Model studies, *Hydrologic budget, *Wetlands, Hydrologic properties, Mathematical models, Water balance, Water table, Florida.

An equation is derived relating the water depth changes in cypress domes to the water budget components of the ecosystem. In this equation, all waters, surface and subsurface, entering or leaving a dome are included. The changes of dome water level exhibit the dynamics of surface and subsurface flows. The dome water level at the end of each month is taken as the sum of the previous month's water level and the water level change predicted for the equation during the month. The model has been calibrated for two different years and for three different domes. The water components are not exactly balanced, but are within the limit of accuracy of the collected data. In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 517-539, 1976. 11 fig, 3 tab, 7 ref.

Descriptors: *Swamps, *Water pollution effects, *Denitrification, Wetlands, Florida, Waste water disposal, Sewage, Nutrients, Nitrogen, Nitrates, Groundwater, Ammonia, Percolation.

The NH4-N and NO3-N levels entering cypress domes receiving sewage effluent was in the range of 4 and 10 ppm N, respectively, while the water entering another dome receiving groundwater had less than 1 ppm NH4-N or NO3-N. The NH4 and NO3 may be taken up by the vegetation of the dome. Part of the NO3 that is present in the water may diffuse into the sediment layer. Once in contact with the active layer of sediment, the NO3 may be converted to N20 or N2 gas through denitrification reactions. The denitrification reactions in the sediments are important for the removal of NO3 entering the groundwater. As water percolates, the NH4 remaining in the water may be absorbed to the cation exchange sites on the organic matter in the sediments. But as these sites reach maximum adsorption, the excess NH4 may percolate through the dome. (See also W79-02256)(Steiner-Mass)

THE ORGANIC SEDIMENTS OF CORKSCREW SWAMP SANCTUARY,
Central and Southern Florida Flood Control District, West Palm Beach, FL.
P. A. Stone, and P. J. Gleason.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 763-771, 1976. 2 tab, 6 ref.

Descriptors: *Swamps, *Peat, *Cores, Wetlands, Florida, Marshes, Nitrogen, Oxygen, Muck soils.

The deposit of organic sediment, principally peat, found at Corkscrew Swamp Sanctuary is occupied by two dissimilar plant communities, an open marsh consisting of graminoid vegetation and a mature cypress swamp dominated by large bald cypress trees. Compared to Everglades peat, Corkscrew Swamp peats are more degraded with less plant material retaining indentifiable tissue structure which is indicative of a poorer preserving environment, possibly a shorter hypoperiod, or deeper zone of aeration. On a moisture-free basis, nitrogen decreases with depth. Oxygen decreases and sulfur increases with depth, except for the bottom sample. The bottom sample may represent a different parent material (plant community) or differing preserving environment, for it is adjacent to calcareous sediments. (See also W79-02256) (Steiner-Mass)

ROOT PRODUCTION AND ROOT TURNOVER IN A WET TUNDRA ECOSYSTEM, BARROW, ALASKA,
Duke Univ., Durham, NC. Dept. of Botany.
G. R. Sharer, and W. D. Billings.
Ecology, Vol. 56, No. 2, p 401-409, Early Spring, 1975. 8 fig, 4 tab, 22 ref.

Descriptors: *Root systems, *Primary productivity, *Tundra, *Turnovers, Ecosystems, *Alaska, Wetlands, Seasonal, Biomass, Root distribution, Tiller systems.

The wet tundra near Barrow, Alaska, is dominated by three species of graminoids: Dupontia fischeri, Carex aquatilis, and Eriophorum angustifolium Root production, turnover, and distribution patterns were studied by direct observation of growing roots and by analysis of whole, interconnected tiller systems dug from the soil. Root weight per unit length and density of individual tillers were also measured in the field. Production of new roots was found to be strongly correlated with age of individual tillers, each species having a distinctive growth pattern and phenology. Root turnover rates varied considerably ranging from an annual turnover in E. angustifolium to 6-8 or possibly 10 years in C. aquatilis. An estimate of root turnover on an ecosystem basis is about 100 g/sq m/yr, or 25% of the live root biomass. Species with the shallowest and longest lived roots have the greatest weight per unit length of root, and vicer versa. Each species has a characteristic root distribution pattern with depth and in relation to the progress of soil thaw. (Stihler-Mass)

BIOCHEMICAL AND TRANSPIRATION STUDIES OF THE GROWTH FORM OF SPARTINA ALTERNIFLORA ON CONNECTICUT SALT MARSHES,
Connecticut Coll., New London. Dept. of Botany.
M. L. Shea, R. S. Warren, and W. A. Niering.
Ecology, Vol. 56, No. 2, p 461-466, Early Spring, 1975. 8 fig, 18 ref.

Descriptors: *Rooted aquatic plants, *Adaptation, *Plant morphology, *Salt marshes, *Connecticut, Coastal marshes, Ecotypes, Intertidal areas, Environmental effects, Plant growth, *Spartina alterniflora.

In southern New England Spartina alterniflora occurs as a tall grass (1.25-2 m) within the intertidal zone and as a short form (0.3-0.4 m) within pannes on the high marsh. By means of electrophoretic comparisons of total soluble proteins and selected enzymes, along with reciprocal field transplants, an attempt was made to clarify the ecotype versus ecophene status of these different forms. All data obtained suggest that the tall and short forms are genetically indistinguishable and therefore merely reflect physiological responses to the environmental differences between the inter-tidal and panne sites

AN ATLAS OF VASCULAR PLANT SPECIES DISTRIBUTION MAPS FOR TIDEWATER MARYLAND,
Maryland Dept. of Natural Resources, Annapolis. Water Resources Administration.
W. S. Sipple
Wetland Publication No. 1, April, 1978. 280 p, 231 fig, 24 ref, 1 append.

Descriptors: *Marsh plants, *Mapping, *Distribution patterns, *Maryland, Wetlands, Coastal marshes, Tidal marshes, Salt marshes, Marshes, Swamps, *Maps.

The locations of 238 species of strand, submerged aquatic, and tidal wetland vascular plants are mapped along the Maryland coast. Species distribution maps are divided into three general categories: strand, marsh, and swamp plants. Strand plants include those that are usually found on beaches, dunes, spits, overwash berms, and similar habitats. Marsh plants are divided further into freshwater and brackish marsh groups and the swamp types into shrub swamp and swamp forest groups. (Steiner-Mass)

SIMULATED FLOW THROUGH THE ROOT XYLEM,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Soils and Crops.
W. J. Busscher, and D. D. Fritton.
Soil Science, Vol. 125, No. 1, p 1-6, January, 1978. 5 fig, 14 ref. 5 eau.

Descriptors: *Xylem, *Root systems, *Flow resistance, Flow rates, *Simulation analysis, Model studies, Water pressure, Evapotranspiration.

Flow through the xylem of a complex root system is simulated to measure xylem resistance to water flow, and to determine whether or not this resistance is significant. Equations are set up that model xylem water flow as if it were flow through thin tubes. The root characteristics needed to solve these equations are obtained from an earlier work. Xylem water flow is first considered for a single main root and its laterals. It decreases with age of the root or increase of root length, and it increases with the addition of laterals. The advantage of an increasing number of main roots is also shown. Finally, flow through the plant crown is compared to Thornthwaite and Blaney-Criddle evapotranspirational estimates. Less than 10 millibars of water pressure is needed to overcome xylem resistance, and, therefore, the resistance is considered negligible. (Skogerboe-Colorado State)

Descriptors: *Swamps, *Nutrients, *Productivity, *Model studies, Wetlands, Florida, Sewage, Cycling nutrients, Bacteria, Marsh plants, Mosquitoes, Marsh management, Forest management, Invertebrates.

Studies of water budget and geology show how cypress domes store and save water compared to reservoirs. Experiments with recycling treated sewage water show that the cypress basins (domes) filter nutrients, microbes, heavy metals, and virus, improving the water as the sewage water recharges groundwater. Measurements and systems models show budgets of phosphorus, nitrogen, and carbon, and the role of trees, shrubs, sediments, duckweed, and sedimentation in processing materials, productivity, total metabolism, and building ecological patterns. Comparisons are made with strands and floodplains. Regional studies consider the quantitative role of swamps in water and nutrient budgets of four counties and the south Florida region. Detailed studies include measurements of encephalitus virus and mosquitoes, indices of insect abundance, chlorophyll, seedlings, litter, decomposition rates and soil characteristics. Engineering costs for swamps to serve in place of tertiary treatment are low. The report includes results of 14 phases, a report of the Center for Wetlands and auxiliary projects, report of a workshop, report on these, and publications, and summaries. RADIATION STUDIES: CYPRESS WETLANDS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences; and Florida Univ., Gainesville. Center for Wetlands
K. Heimburg.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p. 157-162, 1976. 1 fig, 1 tab, 2 ref.

Descriptors: *Swamps, *Light penetration, *Climates, Wetlands, Light intensity, Aquatic environment, Light.

Spectral measurements show that cypress canopy does not significantly change the quality of sunlight reaching the bottom of the dome from that incident at the top; it just reduces its itensity. Too few measurements of the reflection spectrum have been made to allow identification of a characteristic cypress spectrum or comparison to reflection spectra of other vegetation types. Meteorologic data indicate that climate inside the domes is ameliorated substantially by the presence of water vapor; during the day it is slightly cooler in the dome than outside it, and the reverse is true at night. The fluctuations in water temperature are much smaller in a duckweed covered dome, an environmental factor that may be important to decomposition processes taking place in the water. SEASONAL CHANGES IN THE DISTRIBUTION OF WATER FERN AND DUCKWEED IN CYPRESS DOMES RECEIVING SEWAGE,
Florida Univ., Gainesville, School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
K. C. Ewel.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville p. 164-170, 1976. 2 fig, 1 tab, 2 ref.

Descriptors: *Swamps, *Floating plant, *Ferns, *Annual succession, Wetlands, Florida, Aquatic plants, Marsh plants, Distribution patterns, Cycling nutrients.

During the spring, summer, and fall, the nonrooted, floating plant cover in two cypress domes which had been receiving secondarily treated sewage consisted almost entirely of two duckweed species, Lemna perpusilla and Spirodela aligorhiza. Small patches of Azolla caroliniana, a small floating water fern, was also found, usually associated with a patch of emergent vegetation. There were no floating plants on the surface of the central area of a cypress dome which has had groundwater pumped into it weekly, although both Lemna and Azolla are common around the edge. Only Lemna and Spirodela are found on the undisturbed dome. During the winter, Azolla increased its percentage of coverage in both domes significantly. This change may be due primarily to a change in light intensity. Considering both the nitrogen-fixing ability of Azolla and the dependence of Lemana on a nitrate source, the shift in species composition may clearly hve important consequence on the nutrient cycling role played by the plants. LITTERFALL AND LITTER DECOMPOSITION IN FOUR CYPRESS DOMES,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
G. Deghi.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p. 197-231, 1976. 15 fig, 3 tab, 1 ref.

Descriptors: *Swamps, *Leaves, *Productivity, Wetlands, Florida, Burning, Canopy, Deciduous trees, Trees.

In two unburned cypress domes, the fastest litterfall rate occurred in November while the peak was delayed until December in two burned domes. Hardwood litterfall peaks occur prior to the peaks of cypress needles, and the earlier peaks of total litterfall in the two unburned domes are presumably due to the lack of hardwoods, primarily blakgum, in the canopy of the burned domes. Large wood accounts for a much larger percentage of the annual litterfall in the burned domes. Because of the fire, there is much dead above-ground organic matter which blows over in the winter when high winds accompany frontal storms. The cumulative total litterfall was 199 and 480 g/sq m/ year for the unburned domes. Large increases in normal litterfall were exhibited by the two burned domes in the second year of the study, 461 and 811 g/sq m/year, respectively. This increase suggests recovery from burning. Little change in tree diameters has been reported in most of the domes; thus, productivity is manifested in litterfall and the cumulative annual litterfall may provide an estimate of net production. DISTRIBUTION OF CHLOROPHYLL IN CYPRESS ECOSYSTEMS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences; and Florida Univ., Gainesville. Center for Wetlands.
S. Brown, and J. Truelson.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 561-576, 1976. 3 fig, 3 tab, 5 ref.

Descriptors: *Swamps, *Florida, *Chlorophyll, Wetlands, Plant pigments, Trees, Photosynthesis, Plant physiology.

In most of the cypress leaves measured, especially those in the top canopy levels, the chlorophyll a content was two to three times the maximum range level of most plants. The results expressed on a mg chlorophyll/g of leaf dry weight show that in general the lower down in the forest canopy the leaves, the greater the concentration of chlorophyll a. This may represent shade adaptation in the leaves in response to lower light levels. The chlorophyll a to b ratio was 1-1.5 for the cypress leaves compared to a normal ratio of 2-3 for most plants. The less fertile cypress domes showed fewer chlorophyll differences than the more fertile sites. (See also W79-02256)(Steiner-Mass)

ACCELERATING SECONDARY SUCCESSION IN CYPRESS STRANDS,
Florida Univ., Gainesville. Dept. of Botany; and Florida Univ., Gainesville. Center for Wetlands.
L. Gunderson.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 738-762, 1976. 2 fig, 10 tab, 7 ref, 1 append.

Descriptors: *Swamps, *Vegetation regrowth, *Forest management, Wetlands, Florida, Trees, Revegetation, Lumbering, Burning, Seeds, Germination.

Seeds and seedlings of cypress were planted into seral stages following logging, burning, and logging-and-burning, to test the successional stage at which cypress invades most successfully. Of the seedlings transplanted, 78% survived. No difference in seedling mortality among sites was noticed. Survival of seedlings in cleaned areas was not different from that of seedlings growing among the existing vegetation. Average seed germination was less than 3% at all sites. The critical factors in cypress regeneration seem to be available seed source and proper water requirements for germination and survival. Once seed sources are removed, regrowth can be slow. Cypress regrowth may be slower than other logged forests due to limited mobility of the seeds. A few seed sources were present at the logged and the burned sites. Regeneration is occurring at these sites and is probably retarded by the moisture requirements. No cypress regeneration was noticed at the logged-and-burned site. (See also W79-02256) (Steiner-Mass)

EARTHQUAKE-INITIATED CHANGES IN THE NESTING HABITAT OF THE DUSKY CANADA GOOSE,
Rutgers - The State Univ., Newark, NJ. Dept. of Botany.
J. H. Crow
The Great Alaska Earthquake of 1964: Biology. National Academy of Sciences, Washington, D.C 1971. p 130-136. 3 fig, 2 tab, 12 ref.

Descriptors: *Alaska, *Marsh plants, *Distribution patterns, *Earthquakes, *Canada goose, *Nesting cover, Wetlands, Salt marshes, Grasses, Marshes, Coastal marshes, Waterfowl, Wildlife habitat

The dusky Canada goose nests in a restricted part of the Copper River delta occupied by a plant community characterized by Hedysarum alpinum americanum and Deschampsia beringensis. This vegetation flourishes in the slightly saline soils at the tops of channel banks, where before the earthquake it was inundated by diluted seawater during occasional storm tides. As a result of uplift during the earthquake, however, the pre-earthquake channel-bank vegetation and the interchannel areas are no longer reached by even the highest tides, and the soil is being rapidly desalinized. Drier conditions and the removal of salt permit invasion of the Hedysarum-Deschampsia belt by plants characteristic of other belts, and hence the favored nesting habitat of the goose is deteriorating. Presumably the Hedysarum-Deschampsia community will eventually reestablish itself at a lower level on the tidal flats, but the area available is expected to be smaller than the area occupied at present. Over the years the dusky Canada goose will find progressively more restricted nesting grounds, which will lead to a reduction in its numbers unless it can adapt to other kinds of vegetation. (Steiner-Mass)

DIURNAL USE OF SMALL WETLANDS BY DUCKS,
Fish and Wildlife Service, Jamestown, ND. Northern Prairie Wildlife Research Center.
A. T. Klett, and L. M. Kirsch.
Journal of Wildlife Management, Vol 40, No 2, p 351-353, April, 1976. 1 tab, 11 ref.

Descriptors: *Ducks, *Blue-winged teal, *Wetlands, *North Dakota, Habitats, Waterfowl, Ponds, Diurnal.

In 1969 morning and afternoon counts of ducks using 43 small wetlands in east-central North Dakota were made; in 1970 morning, afternoon, and evening counts were made. These wetlands were typically shallow and devoid of emergent cover except for a narrow marginal band. Peak use by Blue-winged Teal occurred in the early morning and evening especially during the period when most birds were observed as segregated pairs. Observations of species other than Blue-winged Teal were too few to determine changes in the use of these wetlands. (Stihler-Mass)

THE EFFECT OF DRAWDOWN DATE ON WETLAND PLANT SUCCESSION,
Winous Point Club, Port Clinton, Ohio.
R. L. Meeks.
Journal of Wildlife Management, Vol. 33(4), p 817-821, October, 1969. 1 tab, 8 ref.

Descriptors: *Marsh plants, *Succession, *Drawdown, Wetlands, Wildlife habitats, Ohio, Freshwater marshes, Marshes, Water levels.

An 80-acre marsh was diked into four units, one of which was drained yearly in mid-March, one in mid-April, and one in mid-May, and one in mid-June. All of the units were reflooded during September. Plant succession followed the same general trend on all units, going from semi-aquatic species to predominantly annual weeds. Fewer years were required with early drawdowns for annual weeds to replace semi-aquatic species. The May drawdown unit had the best plant associations for wildlife after seven seasons. (Steiner-Mass)

PHYSIOLOGICAL ASPECTS OF WATER USE EFFICIENCY,
Nebraska Univ., Lincoln. Dept. of Agronomy.
C. Y. Sullivan, J. D. Easton, J. M. Bennett, and N. V. Norcio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 344, Price codes: A04 in paper copy, A01 in microfiche. Nebraska Water Resources Center, The University of Nebraska, Project Completion Report, 1978. 57 p, 6 fig, 3 tab, 11 ref. OWRT A-044-NEB(1). 14-34-0001-8029.

Descriptors: *Water use efficiency, *Sorghum, *Water stress, *Water utilization, Drought tolerance, *Photosynthesis, Root systems, Leaves, Osmotic pressure, Turgor potential, *Plant physiology.

Grain sorghum plants growing in hydroponic cultures in a greenhouse were subjected to various levels of water stress by the addition of polyethylene glycol to the nutrient solutions. Several physiological parameters, including net photosynthesis, leaf diffusive resistance, leaf water, osmotic and turgor potentials were measured before, during and after the stress periods. In addition, total grain yield, number of seeds per plant, total dry weight, plant height, stover weight, root weight and length, and water use efficiency were determined for each treatment. Plant conditioning or hardening to drought stress was examined by monitoring photosynthesis of plants which had previously been exposed to a preconditioning stress. It was concluded that plants which had been subjected to a preconditioning stress could better withstand and recover from a later more severe water deficit. This conditioning response is probably a result of both physical and biochemical changes which occur within the plant. The conditioning response was also dependent on genotype. In other experiments it was shown that sorghums could grow well with only a small portion of their total root systems in contact with nutrient water. It is suggested that selection for sorghum genotypes with a few penetrating roots with high water absorption capacity would increase water use efficiency.

2J. Erosion and Sedimentation

GRADIENT, DISCHARGE, AND PARTICLE-SIZE RELATIONS OF ALLUVIAL CHANNELS IN KANSAS, WITH OBSERVATIONS ON BRAIDING,
Geological Survey, Lawrence, KS. Water Resources Div.
W. R. Osterkamp.
American Journal of Science, Vol 278, p 1253-1268, November 1978. 5 fig, 3 tab, 16 ref.

Descriptors: *Gradients(Streams), *Alluvial channels, *Average flow, *Bottom sediments, *Particle size, *Kansas, Streams, Sediment transport, Meanders, Braiding, Beds, Bed material, Power-function equations.

Gradient, mean-discharge, and bed-material-size data were compiled for 76 alluvial streams of Kansas. A series of functional analyses of the data demonstrates that groupings based on median particle size and sorting of bed material are better than groupings based on channel pattern or sinuosity. Data collected suggest that particle sizes of bed material affect braided channels in a similar manner as for nonbraided streams. Consideration of conditions conductive to braiding indicate the possibility that lower limits for gradient can be defined for braided streams of specified mean-discharge and bed-material characteristics. (Woodard-USGS)

SEDIMENTATION IN HOT CREEK IN VICINITY OF HOT CREEK FISH HATCHERY, MONO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
D. E. Burkham.
Available from OFSS Branch of Distribution USGS, Box 25425, Fed. Ctr., Denver, CO. 80225; Microfiche $4.00, Paper copy $1.75. Open-file report 78-661, August 1978. 9 p, 1 fig, 9 ref.

Descriptors: *Sedimentation, *Fluvial sediments, *Streams, *Environmental effects, *Trout, Sediment transport, *California, Mono County(CA), *Hot Creek.

An accumulation of fine-grained sediment in Hot Creek downstream from Hot Creek Fish Hatchery, Mono County, Calif., created concern that the site may be deteriorating as a habitat for trout. The accumulation is a phenomenon that probably occurs naturally in the problem reach. Fluctuation in the weather probably is the basic cause of the deposition of fine-grained sediment that has occurred since about 1970. Man's activities and the Hot Creek Fish Hatchery may have contributed to the problem; the significance of these factors, however, probably was magnified because of drought conditions in 1975-77. (Woodard-USGS)

A CONTRIBUTION TO THE LAKE PLEISTOCENE STRATIGRAPHY OF THE SUSQUEHANNA RIVER VALLEY OF NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
A. D. Randall.
Empire State Geogram, Vol 14, No 2, p 1-15, 1978. 2 fig, 2 tab, 15 ref.

Descriptors: *Stratigraphy, *Sediment transport, *Particle size, *Geologic formations, River basins, Valleys, Glaciers, Ice, Melt water, Geologic history, Evaluation, *New York, *Susquehanna River basin(NY), *Late Pleistocene, *Stratified drift.

Local variations in erratic-pebble content of stratified drift in parts of the Susquehanna River basin in New York are comparable in magnitude to regional variations described in the literature. Along the Susquehanna valley west of Binghamton, older stratified drift in any locality contains very few erratic pebbles in comparison with younger deposits. Extensive terraces are capped by 'bright' gravel, in which 30 to 50 percent of the pebbles are of erratic lithologies; the terraces are underlain and locally bordered by 'drab' gravel and sand in which 85 to nearly 100 percent of the pebbles consist of local shale and siltstone. Any till beneath the stratified drift is drab. These relationships are useful in local subsurface correlation. The stratified drift was deposited during a single deglaciation in which melt-water streams probably extended a few tens of miles through stagnant and active ice; these streams may have played a major role in transporting erratic material southward. (Woodard-USGS)

SUBSURFACE GEOLOGICAL INVESTIGATION OF A PLEISTOCENE BRAIDED STREAM IN THE NORTHERN COASTAL PLAIN, DELAWARE (U.S.A.),
Delaware Geological Survey, Newark.
N. Spoljaric.
Sedimentology, Vol. 21, p 451-461, 1974, 3 fig, 17 ref. OWRT B-002-DEL(4).

Descriptors: *Braiding, *Channel morphology, *Facies(Sedimentary), *Fluvial sediments, *Sedimentary structures, Texture, *Coastal plains, Fluvial depositional environments, Subsurface primary sedimentary structures, Textural sedimentary parameters, Northern Atlantic Coastal Plain, *Delaware.

Primary sedimentary structures and sedimentary textures of the Pleistocene fluvial sediments of the Columbia Formation were investigated both in the outcrops and in the subsurface. Unknown sedimentary structures were recognized in the subsurface by correlating some textural parameters (mean grain size, skewness, and kurtosis) of the drilling (subsurface) samples with those of the outcrop samples where the sedimentary structures were known. The utilization of both the sedimentary structures were known. The utilization of both the sedimentary structures and the textures made it possible to recognize major morphologic elements of a Pleistocene stream system (channels, channel bars, floodbasins, and channel-fills) in the subsurface and to reconstruct, in a general way, the events that occurred during the existence of the stream system. Although the technique of the recognition of primary sedimentary structures in the subsurface employed in this study has been useful in the interpretation of the fluvial sedimentary bodies, it needs further testing before it can be accepted as a new geologic tool.

MECHANISM OF FORMATION AND FORECAST OF THE DEVELOPMENT OF THE VOLGA DELTA,
R. I. Selivanov.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 55-60, 1977. 5 fig, 1 tab, 24 ref. Translated from News of the All-Union Geographic Society (Izvestiya VGO), Vol. 109, No. 1, p 47-55, 1977.

Descriptors: *Deltas, *Geomorphology, *Alluvial fans, *Forecasting, Rivers, Alluvial channels, Sedimentology, Erosion, On-site investigations, Surveys, Analysis, Sediments, Sediment discharge, Foreign research, Foreign countries, *USSR, *Volga River(USSR), *Caspian Sea.

The Volga delta is a very dynamic geomorphological formation. In the last 50-60 years, its active part has increased by approximately 1/3 of its initial size. Two major processes participate in the advance of the front edge of the Volga delta: sediment accumulation and changes in sea level. It was shown that the Volga delta will advance almost 5 km in 25 years under high-flow conditions, and its front edge will grow 9 km under moderate flow conditions. With runoff of 75% probability, which corresponds approximately to the present inflow into the sea, the delta will move 11 km. The Volga delta can be preserved in approximately its present state only if the Caspian Sea level remains stationary and flow is moderate. Redistribution of liquid runoff and sediment discharge in the delta will affect navigation conditions. Navigation will cease in many eastern arms if their channels are not deepened and cleaned. With a sharp advance of the delta by the year 2000, it will be necessary to increase the length of the Volga-Caspian Canal by no less than 40-50 km, and the volume of dredging work will increase. SPLASH AND DISCONTINUOUS RUNOFF AS CREATORS OF FINE SANDY LAG DEPOSITS WITH KALAHARI SANDS,
J. Savat, and J. Poesen.
Catena, Vol 4, p 321-332, 1977. 6 fig, 27 ref.

Descriptors: *Sediment transport, *Impact(Rainfall), *Particle size, Rainfall-runoff relationships, Sands, Erosion, Channel erosion, Sedimentation rates, Slope stability, Silts, Laminar flow.

The sand-covered western border of the Kwango Plateau, belonging to the Kalahari system, was cut during the Quaternary by tributaries of the Zaire River running toward the sea. Sedimentation of these sands has since been the focus of several investigations aimed at determining the processes that alter grain size distribution. A study of the large convex dome-shaped hills found near the city of Kinshasa reveals that splash and discontinuous runoff are the dominant erosion processes shaping these hills. Typically, their sand cover becomes progressively finer downhill where the slope is steeper. For the present study, 33 samples were taken from four locations on the top and slopes of Amba Hill. Grain size parameters were measured. Only fine sand, silt, and clay below .214 mm were found on the downhill convex western slope. Laboratory simulation illustrated that splash alone was not responsible for this sorting as it leaves the coarsest sands (7.6 mm) behind on the hilltop. Disturbed laminar flow is found to accomplish this sorting since it affects all grains including those coarser than 1.0 mm. Very fine fractions were found to be protected to some extent by the formation of a filtration pavement. (Tickes-Arizona)

Geological Society of America Bulletin, Vol. 88, p. 1619-1622, November 1977. 4 fig, Doc. No. 71108. OWRT B-031-WYO(3), 14-34-0001-6134

Descriptors: *Structural geology, *Faults, Geologic formations, Displacements, Geomorphology, Arizona, *Holocene movement, *Western Grand Canyon(Ariz), Toroweap fault, Hurricane fault, Southwestern Colorado Plateau.

The Toroweap and Hurricane faults and a subsidiary fault in the western Grand Canyon exhibit evidence of Holocene movement. This evidence includes scarps in alluvium and sediments ponded against a fault on the downthrown block. These displacements are the latest in a well-exposed record of recurrent movements along the major faults in the region.

SYSTEMATIC ABSORBANCE ERRORS WITH TECHNICON AUTOANALYZER II COLORIMETERS,
Rhode Island Univ., Kingston. Graduate School of Oceanography
P. N. Froelich, and M. E. Q. Pilson
Water Research, Vol 12, No 8, p 599-603, 1978. 4 fig, 5 ref.

Descriptors: *Colorimetry, *Instrumentation, *Sea water, Refractivity, Automation, Equipment, Laboratory tests, Optical properties, Phosphates, Salinity, Aqueous solutions, Light, Absorption, Water properties, Chemical analysis, Autoanalyzer colorimeters, Flowcells.

Technicon AutoAnalyzer II colorimeters have spectrophotometric flowcells with curved optical ends. Light passing through these flowcells is refracted severely at the non-perpendicular ends. Curved ends, therefore, cause differences in apparent absorbance measured at the phototube; the absorbance differences are related to differences in the refractive indices of the solutions in the cells. This can cause significant error in the colorimetric analysis of solutions with different refractive indices (caused, for example, by variations in salinity). This effect is responsible for a systematic error which, for typical AutoAnalyzer determinations of phosphate in seawater or estuarine waters, can approximate 0.2 micro M. (Sims-ISWS)

Paper SPE 7505 presented at the 53rd Annual Fall Technical Conference and Exhibition of the Society of Petroleum Engineers of AIME, held in Houston, Texas, October 1-3, 1978. 8 p, 6 fig, 1 tab, 30 ref.

Descriptors: *Gulf of Mexico, *Chemical analysis, *Water analysis, *Geothermal studies, *Thermal water, *Oil fields, Texas, Louisiana, Coasts, Stable isotopes, Analytical techniques, *Formation water, Gulf Coast.

Detailed chemical analyses of 120 formation-water samples from 25 oil and gas fields in coastal Texas and Louisiana show that the salinity of water in the geopressured zones ranges from about 10,000 to 270,000 mg/liter dissolved and may be higher or lower than the salinity of water in the normally pressured zones. The formation waters in the geopressured zones are most probably modified connate waters representing the original marine water of deposition. The chemical composition of these waters, however, is markedly different from that of ocean water. The differences in composition resulted from physical and chemical interactions between water and sediments. (Woodard-USGS)

THE BEHAVIO OF SULFATE ON SALT INPUT IN PODZOLIC BROWN EARTH,
Goettingen Univ. (West Germany). Inst. fuer Bodenkunde und Waldenaehrung.
P. K. Khanna, and F. Beese.
Soil Science, Vol. 125, No 1, p 16-22, January, 1978. 4 fig, 3 tab, 17 ref.

Descriptors: *Sulfates, *Salts, Adsorption, Chemical precipitation, *Podzols, Effluents, *Leachate, Sorption, Inorganic compounds.

The behavior of sulfate concentration in the leachate of an acid podzolic brown earth was studied, when a slug of neutral salt (KCl + KNO3) passed through the upper sulfate-enriched layers of the soil. The effluent of five undisturbed soil columns was collected daily, and H(+), Cl(-), and SO4(--) concentrations were measured. A constant flux of water, either 1.0 cm/day or 0.3 cm/day, was maintained. Sulfate concentration in the leachate showed a decrease when the salt passed the columns. The decrease correspond with an increase of H(+) and Cl(-) concentrations. The behavior of sulfate was almost the same irrespective of the flow rates. At the lower rate, sulfate retention was about twice that at the higher rate. Though precipitation of basic aluminum sulfates cannot be excluded, the behavoir of sulfate must be interpreted in terms of specific adsorption. (Skogerboe-Colorado State)

MECHANISM OF ZINC ADSORPTION BY IRON AND ALUMINUM OXIDES,
Manitoba Univ., Winnipeg. Dept. of Soil Science.
M. Kalbasi, G. J. Racz, and L. A. Loewen-Rudgers.
Soil Science, Vol. 125, No. 3, p 146-150, March, 1978. 1 fig, 1 tab, 13 ref.

Descriptors: *Adsorption, *Zinc, *Iron oxides, *Aluminum oxides, Ion exchange, Aqueous solutions, Soil chemistry, Hydrogen ion concentration, Chlorides.

Adsorption of Zn from aqueous solutions of ZnCl2 by hydrated A1203 and Fe203 was highly pH-dependent and increased markedly with increasing pH. Fe203 had a higher Zn adsorption capacity, at equivalent pH values, than A1203. Experimental observations suggested that surface aqus (-OH2) and hydrono (-OH) groups were involved in Zn adsorption. In addition, experimental observations lead to the postulation that two types of adsorption, specific and nonspecific, depending upon reversibility (exchangeability with Ba(2+)), occurred. Specific and nonspecific adsorptions of Zn(2+) were accounted for 60 to 90 percent and 40 to 10 percent of the total Zn adsorption respectively. For specific adsorption, an olation bridge structure between Zn(2+) and two surface -OH2 groups was postulated; and for nonspecific adsorption, a single-bond structure in which ZnCl(+) replaced one H(+) from surface -OH2 groups was postulated. The ratio of specific to nonspecific adsorption increased with increasing pH. It was concluded that specific adsorption of Zn by A1203 and Fe203 may be at least partially responsible for the frequently reported fixation and unavailability of added Zn to soils. (Skogerboe-Colorado State)

REACTION PRODUCTS AND SOLUBILITY OF APPLIED ZINC COMPOUNDS IN SOME MANITOBA SOILS,
Manitoba Univ., Winnipeg. Dept. of Soil Science.
M. Kalbasi, G. J. Racz, and L. A. Lewen-Rudgers.
Soil Science, Vol. 125, No. 1, p 55-64, January, 1978. 4 fig, 6 tab, 26 ref.

Descriptors: *Zinc, *Solubility, *Sulfates, Sulfides, Ammonium compounds, Fertilizers, X-ray diffraction, Calcareous soils, Soil chemistry, *Canada, *Manitoba.

ZnSO4, ZnEDTA, ZnS, and ZnSO4 plus NH4H2PO4 were banded in soils, and the solid-phase zinc compounds were identified using x-ray diffraction analysis. Solubility of zinc in soil adjacent to the fertilizer band was determined by measuring the zinc concentration in soil-water extracts. The reaction product in a noncalcareous soil (pH 8.2) treated with ZnSO4, was Zn(OH)2, which was metastable and persisted for only a few weeks. ZnSO4 was usually precipitated as ZnCO3 and Zn5(CO3)2(OH)6 in the calcareous soils. No crystalline reaction products were detected in soils treated with ZnEDTA. Zn5(CO3)2(OH)6 and Ca(Zn(OH)3)2.2H2O were found in a calcareous soil treated with ZnS and incubated for 32 weeks. Zn3(PO4)2.4H2O and NH4ZPO4 were identified in soils treated with ZnSO4 plus NH4H2PO4. Concentrations of zinc in water extracts of soils treated with zinc increased in order: ZnS, ZnSO4, ZnEDTA. Zinc concentration in water extracts of soils treated with ZnSO4 or ZnEDTA decreased with time of incubation, whereas it increased in soils treated with ZnS. Addition of phosphate to ZnSO4 decreased zinc concentrations in soil-water extracts, as compared to soils treated only with ZnSO4. (Skogerboe-Colorado State)

RESIDUAL FORMS OF FERTILIZER NITROGEN IN FIELD SOILS,
Agricultural Research Service, Durant, OK. Water Quality Management Lab.
S. J. Smith, F. W. Chichester, and D. E. Kissel.
Soil Science, Vol. 125, No. 3, p 165-169, March, 1978. 1 fig, 2 tab, 17 ref.

Descriptors: *Fertilizers, *Nitrogen, Chemical analysis, *Nitrates, Chemical reactions, Aerobic conditions, Soil chemistry.

Residual fertilizer N was characterized in Houston Black clay and Keene silt loam surface soils from recent field microplot-N balance studies involving liberal (328-560 kg N/ha) 15N-labeled rates. Results indicate residual N is readily distributed in all the organic and inorganic soil N forms, even after the first cropping season. An equivalent distribution of the residual N with the indigenous soil N, however, had not occurred after three years. During this period the residual N was more than twice as susceptible to mineralization as the soil N. Most of the residual N was incorporated in amino acid N-forms. (Skogerboe-Colorado State)

HULA VALLEY PEAT: REVIEW OF CHEMICAL AND GEOCHEMICAL ASPECTS,
Hebrew Univ., Jerusalem (Israel) Dept. of Organic Chemistry.
S. Brenner, R. Ikan, N. A. Agron, and A. Nissenbaum.
Soil Science, Vol. 125, No. 4, p 226-232, April, 1978. 3 fig, 2 tab, 32 ref.

Descriptors: *Peat, *Chemical properties, *Pleistocene epoch, Inorganic compounds, Organic matter, Stable isotopes, Geochemistry, *Israel(Hula Valley), Chlorides.

In the Hula Valley, Israel, four layers of peat of Middle Pleistocene to Holocene age, interbedded with limnic clays and marls, are found above 300-m depth. The main detrital minerals are kaolinite, montmorillonite, and illite. Average elemental values of organic and inorganic matters (on dry basis) present in each horizon and average calorific values of each horizon are reported. Organic constituents of the upper layer have been identified. A detailed quantitative investigation of the distribution with depth in the top peat layer of the humic, fulvic, and hymatomelanic acids, as well as of the beta-humus and humin, showed humin to be the dominant fraction of the organic matter. Analysis of the peat organic fractions for carbon and hydrogen stable isotopes shows that with depth the difference in delta C13 between the humic and fulvic acids disappears and the delta C13 stabilized at around-18 parts per thousand. The isotope data indicate the dynamic nature of the fulvic acid in the peat. The delta D values were around-60 parts per thousand, but the data are too meager for any firm conclusion. (Skogerboe-Colorado State)

THE NATURE OF GROWTH FORMS IN THE SALT MARSH GRASS SPARTINA ALTERNIFLORA,
Marine Biological Lab., Woods Hole, MA. Boston Univ. Marine Program.
I. Valiela, J. Teal, and W. Deuser
The American Naturalist, Vol. 112, No. 985, p 461-470, May-June, 1978. 4 fig, 1 tab, 32 ref.

Descriptors: *Salt marshes, *Grasses, *Plant growth, Rooted aquatic plants, Vegetation, Seeds, Marshes, Genetics, Succession, Nutrients, Nitrogen, Fertilization, Massachusetts, Spartina alterniflora tall form, Spartina alterniflora short form.

Long term fertilization was conducted on plots of Spartina alterniflora in Great Sippewissett Marsh, Massachusetts. Increases in nutrinet supply convert short form S. alterniflora into plants resembling the tall form in biomass/sq.m. and morphology. Competition for light is a probably cause of the tall form's growth habit. Added nutrients led to larger delta C13 values probably due to incorporation of heavier carbon from internal air spaces of S. alterniflora during high tide, when exchange of gases with the atmosphere is prevented. Interstitial water replenished at each tide is greater in areas supporting the tall-form vegetation. Greater densities of marsh mussels are found in tall-form areas. Their feeding and defecation lead to larger accumulations of particulate matter and nutrients in those areas. Nitrogen amounts delivered by algal nitrogen fixation does not differ greatly under the two forms. Seedling establishment usually produces tall-form plants. A higher percentage of tall form plants than short form produce seed. Electrophoretic results show no genetic differences; therefore, the form of seedlings is probably the result of competition for nutrients and is modified by other factors. Usually seedlings become established at the edge of banks and grow into tall plants. Sedimentation resulting in elevated marsh surfaces and consequent competition by extant plants producing vegetatively results in short plants. This succession may be reversed by an increase in nutrient supply. This pattern over time and space is probably found in a variety of other aquatic plants.

DO TIDES AFFECT COASTAL INSECT COMMUNITIES,
Houston Univ., TX. Dept. of Biology.
G. N. Cameron.
The American Midland Naturalist, Vol 95, No 2, p 279-287, April 1976. 4 tab, 32 ref.

Descriptors: *Tides, *Insects, *Communities, *Tidal effects, Marshes, Coastal marshes, Salt marshes, Flooding, Water level fluctuations, Vegetation, Marsh plants, Population.

Clip-quadrat samples taken prior to, during and after inundating tides in Salicornia and Spartina salt marshes during 1 year revealed that periodic tidal inundation had little effect upon the number of adult species or their vertical stratification within the marsh vegetation. Possible explanations for the insects remaining in the marsh during inundation are considered. Sorensen's Quotient of similarity demonstrated little alteration in species composition, and a trophic analysis showed no change in the relative proportion of herbivores, saprovores or predators as a result of inundation. The possibility that salt-marsh insects remaining in place on the vegetation during inundating tides may be a result of early morning sampling is considered. Early morning low temperatures suppress the insect's metabolic rate and increase the chance of survival during inundation on the limited amount of oxygen available in surface bubbles. These findings support previous conclusions that salt-marsh insect populations are regulated primarily by biological rather than physical factors. (Maroncelli-Mass)
W79-02089

THE DISTRIBUTION OF JUNCUS ROEMERIANUS IN THE SALT MARSHES OF NORTH AMERICA,
Gulf Coast Research Lab., Ocean Springs, MS.
L. N. Eleuterius
Chesapeake Science, Vol 17, No 4, p 289-292, December, 1976. 1 fig, 1 tab, 25 ref.

Descriptors: *Aquatic plants, *Salt marshes, *Distribution, *North America, Coastal marshes, Marshes, Wetlands, Gulf coastal plain, Atlantic coastal plain, Distribution patterns, Juncus roemerianus.

Although scattered individuals of Juncus roemerianus Scheele may be found northward in New Jersey, Long Island, New York, Connecticut and southward along the Laguna Madra in Texas, Mexico, and on the Caribbean Islands, the species is most prevalent within the South Atlantic and Gulf coastal marshes of the eastern United States. Here there are approximately 3,174,333 hectares of salt marsh of which 72.9% occur on the Gulf coast and 27.1% on the Atlantic coast. Juncus roemerianus dominates 20.7% of the marsh in the south Atlantic states and 7.3% of the Gulf coast marshes, but covers more marsh area on the Gulf coast (170,067 hectares) than on the Atlantic coast (149,316 hectares). Thus, there are approximately 320,000 hectares of salt marsh dominated by J. roemerianus in North America. (Maroncelli-Mass)

THE AUTECOLOGY OF SAWGRASS IN THE FLORIDA EVERGLADES,
Agricultural Research Service, Fort Lauderdale, FL. Southern Region.
K. K. Steward, and W. H. Ornes.
Ecology, Vol. 56, No. 1, p 162-171, Winter, 1975. 4 fig, 9 tab, 26 ref

Descriptors: *Plant ecology, *Rooted aquatic plants, *Florida, Ecology, Nutrients, Seasonal, Standing crops, Nutrient requirements, Marshes, Wetlands, Primary productivity, Nitrogen, Phosphorus, Potassium, Copper, *Sawgrass

Standing crop, plant density, stem length, leaf numbers, growth rate, and nutrient relationships in plant tissue, soil, and water were estimated monthly over a 12-18 mo period in mature sawgrass stands as well as in stands regrowing after fires. Daily rainfall and water depth were also measured. Mature stands showed little seasonal variation in standing crop, plant density, and concentration of most inorganic nutrients. Plant nutrient requirements were estimated to be low because nutrient levels in tissues were low as compared to those of other Everglade macrophyte species. Copper (Cu) and phosphorus (P) were particularly low. Levels of available nutrient in soil varied with no seasonal pattern. Most nutrients were in adequate supply, except that available nitrogen (N), P, potassium (K) and Cu were generally very low. Concentration of most nutrients in culms regrowing after fires was high during early growth stages, but decreased to levels found in older culms after 3-5 mo. Concentrations of calcium, iron, and zinc were exceptions. After 18 no growth, burned stands had produced only 38% of the standing crop contained in unburned mature stands. The apparent low nutrient requirements of sawgrass may partially explain the dominance of this plant in the marsh community. (Stihler-Mass)

ANGIOSPERM PRODUCTION OF THREE VIRGINIA MARSHES IN VARIOUS SALINITY AND SOIL NUTRIENT REGIMES,
Virginia Inst. of Marine Science, Gloucester Point, VA
I. A. Mendelssohn, and K. L. Marcellus
Chesapeake Science, Vol 17, No 1, p 15-23, March, 1976. 5 fig, 6 tab, 52 ref.

Descriptors: *Vegetation, *Productivity, *Marshes, Salinity, Nutrients, Soils, Nitrogen, Phosphorus, Salt marshes, Estuaries, Rooted aquatic plants, Angiosperms, Oligohaline, Mesohaline, Euhaline, Virginia

The net aerial angiosperms productivity, salinity, and soil nutrient composition were determined for three Virginia marshes. Oligohaline Ware Creek Marsh and mesohaline Carter Creek Marsh were most productive, 563 and 572 g/sq m/yr, respectively, while euhaline Wachapreague Marshes was least productive, 362 g/sq m/yr. Species in Carter and Ware Creek Marshes were clustered into associations based on salinity tolerance. Nitrogen and phosphorus concentrations of Spartina alterniflora tissue were high in the spring and decreased as the growing season continued. Soil nutrient concentrations were variable and trends during the growing season were not discernible. No significant correlations were found between soil and plant nutrient concentrations. Although the empirical data sug-

gests that high soil salinity and low soil nitrogen and phosphorus concentrations limited primary productivity in Wachapreague Marsh, a multiple regression of standing crop on these parameters did not delineate any as the primary factors limiting salt marsh production. (Maroncelli-Mass)

EFFECTS OF SIMULATED FLOODING ON ALLIGATOR EGGS,
Louisiana Wildlife and Fisheries Commissionm, Grand Chenier.
T. Joanen, L. McNease, and G. Perry.
Paper presented at 31st Annual Meeting, Southeastern Association of Game and Fish Commissioners, October 9-12, 1977, San Antonio, Texas. 7 p. 2 tab, 6 ref.

Descriptors: *Submergence, *Hatching, *Flooding, Wetlands, Coastal marshes, Hurricanes, Wildlife, Reptiles, Mortality, Louisiana, *Alligator, *Eggs, Simulation analysis.

Alligator (Alligator mississippiensis) eggs were collected at four intervals during incubation and subjected to a single submergence to test the effects of flooding on hatchability. Treatments consisted of a 2-hour, 6-hour, 12-hour, and a 48-hour submergence. Hatching success was significantly related to the duration of immersion. Minor flooding can be tolerated, however, extended submergence for 12 hours or longer after the first 30 days of incubation produced total mortality. (Stihler-Mass)

FOOD HABITS OF COASTAL MARSH RACCOONS WITH OBSERVATIONS OF ALLIGATOR NEST PREDATION,
Louisiana Cooperative Wildlife Research Unit, Baton Rouge.
D. M. Fleming, A. W. Palmisano, and T. Joanen.
Presented to the 30th Annual Conference of the Southeastern Association of Game and Fish Commissioners, October, 1976, Jackson, Mississipi, 23 p, 1 fig, 3 tab, 14 ref.

Descriptors: *Food habits, *Predation, *Mammals, *Reptiles, *Nests, *Coastal marshes, Food abundance, Crustaceans, Wildlife, Freshwater marshes, Flooding, Water levels, Seasonal, Marking techniques, Dye releases, Wetlands, Louisiana, *Raccoon, *Alligator, Intermediate marshes, Brackish marshes, Eggs.

Food habits of the coastal marsh raccoon, Procyon lotor magalodous Lowery, in Louisiana were studied from June 1973 to August 1974. The raccoon's role as predator of the eggs and hatchlings of the American alligator, Alligator mississippiensis, was also evaluated. Visual observations of nest predation, information obtained from radio-instrumented raccoons, and the use of Rhodamine B dye solution to spray egg clutches were utilized in data gathering. Scats were collected and examined for alligator remains or traces of the dye. Eight hundred and sixty-six raccoon scats were collected from the fresh, intermediate and brackish marsh types, an average of 24 scats per month per habitat type. Crustaceans were the major food item and comprised 49 percent of the yearly diet of raccoons. Fruits were important fall foods. Although not utilized in great quantities, insects were also important, particularly during periods of prolonged marsh flooding. A marked difference occurred between years in the incidence of raccoon predation on alligator nests ranging from no predation in the 1973 nesting season to 45 percent in 1974. The difference was believed related to water level and its influence on the feeding behavior and subsequent movement patterns. (Maroncelli-Mass)
W79-02117

ALLIGATOR DIETS IN RELATION TO MARSH SALINITY,
Louisiana Wildlife and Fisheries Commission, Grand Chenier.
L. McNease, and T. Joanen.
Paper presented at the 31st Annual Meeting of the Southeastern Association of Game and Fish Commissioners, October 9-12, 1977, San Antonio, Texas. 11 p, 2 tab, 10 ref.

Descriptors: *Food habits, *Salinity, *Marshes, Louisiana, Wetlands, Reptiles, *American alligator.

Three hundred and fourteen large American alligators (Alligator mississippiensis) collected in the marshes of southwest Louisiana in conjunction with 1972 and 1973 autumn hunting seasons were examined for food contents. Foods were categorized by year and marsh type (brackish, intermediate, and fresh). Vertebrates were the most important foods consumed, of which mammals comprised the largest percentage by weight. Arthropods and fish were important foods in the more saline areas. Thirteen percent of the adult females contained alligator eggs or egg shells in their stomach. (Stihler-Mass)

TRANSPORTATION AND ACCUMULATION OF FINE-GRAINED SEDIMENTS IN THE ESTUARINE ENVIRONMENT: RECOMMENDATIONS FOR RESEARCH,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, H. J. Bokuniewicz, and R. B. Gordon.
Special Report No. 14, Reference 78-2, July 1978. 17 p, 2 append.

Descriptors: *Estuarine environment, *Sediment transport, *Estuaries, Sedimentary processes, Fine-grained sediments.

A Workshop on Transport Processes in Estuaries was held at the Marine Sciences Research Center, State University of New York, Stone Brook, New York from 10 November to 14 November 1976. Thirty-one participants from some 18 institutions and agencies focused their discussions on transport of water, salt, and fine-grained suspended sediments. It was concluded that there is no comprehensive method for comparing different estuarine sedimentary regimes. The kinds of studies recommended are designed to produce, not only a better understanding of estuarine transport mechanisms, but more specifically to produce, a significant improvement of knowledge of those sedimentary processes that characterize estuarine systems. Development of an estuarine sediment system will require sustained research programs over periods of years, perhaps decades. Some of the more important research components of an estuarine sediment system may be of local, or regional importance and should be supported by appropriate State and Federal agencies. Regional funding mechanisms should be established to ensure sustained support of research and monitoring of estuarine systems. (NOAA)

SEICHES IN THE BALTIC SEA AND THEIR EFFECT ON FLOODS IN THE NEVA RIVER DELTA,
B. A. Pomytkin.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 68-72, 1977. 4 fig, 2 tab, 14 ref. Translated from News of the All-Union Geographic Society (Izvestiya VGO), Vol. 109, No. 2, p 143-149, 1977.

Descriptors: *Seiches, *Oceans, *Deltas, *Surges, Floods, On-site investigations, Waves(Water), Gulfs, Water level fluctuations, Frequency, Sea level, Wind tides, Tides, Foreign research, Foreign countries, *USSR, *Baltic Sea, *Gulf of Finland, *Neva River Delta(USSR).

This paper was based on published material and on an analysis of recent marigrams of some gaging stations in the Gulf of Finland. Seiches observed in the Baltic Sea and in the Gulf of Finland were described on the basis of published data and field observations in 1973-1974. It was concluded that: (1) Periodically recurring standing waves, i.e., seiches, are observed throughout the year in the Baltic Sea and at the head of the Gulf of Finland. (2) Seiches with an oscillation period of 8 hours, forming during the passage of a cyclonic front across the Gulf of Finland and having an average oscillation amplitude of 20-30 cm and a maximum amplitude to 100 cm, are most frequent. (3) The next in frequency is a two-node seiche with a 24-hour period, an average amplitude of 40-50 cm, and a maximum amplitude to 150 cm. (4) Seiche oscillations, by becoming superposed on high water in the Neva delta, can cause an additional rise in level in the delta during a storm time of 50-60 cm or more. However, alone, in pure form, they cannot cause floods in Leningrad. (Humphreys-ISWS)

SURFACE DRIFTER MOVEMENTS OBSERVED IN PORT ANGELES HARBOR AND VICINITY, APRIL 1978,
Evans-Hamilton, Inc., Seattle, WA.
C. C. Ebbesmeyer, J. M. Cox, and J. M. Helseth.
NOAA Technical Memorandum ERL MESA-31, September 1978. 205 p, 7 fig, 3 tab, 7 ref, 6 plates.

Descriptors: *Estuaries, *Tidal effects, *Eddies, *Wind, Oil spills, Drifting(Aquatic), Washington, Port Angeles Harbor(Wash), *Surface drifters, Oil slicks, Strait of Juan de Fuca(Wash).

Described is a field experiment in which movements of surface drifters were observed nearshore within a fjord-like estuary, the Inner Strait of Juan de Fuca, Washington. The study area straddles a major sill (Green Point to Victoria) terminating between two prominant spits (Ediz Hook and Dungeness Spit). Reported herein for 23-30 April 1978 are position and trajectories for three types of drifting objects released primarily in the vicinity of Port Angeles Harbor (behind Ediz Hook): (1) 123 drift sheets - 10 to 15 each positioned several times per hour during daylight using a small aircraft; (2) 700 drift cards - 240 shore recoveries tabulated; and (3) 46 drogues - 4 to 5 each positioned several times per hour during daylight using a small craft. Preliminary analysis indicates complex patterns of tidal eddies and a tendency for westerly winds to drive floatable materials onshore. (NOAA)

VELOCITY AVERAGING IN ESTUARIES CHARACTERIZED BY A LARGE TIDAL RANGE TO DEPTH RATIO,
South Carolina Univ., Columbia. Dept. of Geology
B Kjerfve
Estuarine and Coastal Marine Science, Vol. 3, p 311-323, 1975, 4 fig, 4 tab, 17 ref. OWRT B-035-GA(3), 14-31-0001-1892.

Descriptors: *Estuaries, *Flow rates, Water circulation, Tidal waters, *Estuarine flow velocities, Velocity profiles.

A general procedure to compute net velocity profiles is proposed for estuaries with a large ratio, Epsilon, of tidal range to mean water depth. Such a technique is desirable in view of the continued interest and numerous and varied research efforts in shallow estuarine waters where flow informaion is essential. Because epsilon exceeds 0.3 in many coastal plain and bar-built estuaries, problems arise in the computation of time-averaged velocity profiles. However, by non-dimensionalization of the depth before time-averaging, these problems are avoided. Rational procedures for the calculation of flow discharge and flux of dissolved and suspended constituents are also proposed for estuaries with a large epsilon-ratio. The averaging procedures are illustrated by computations on 561 velocity profiles measured in the Duplin River, A Georgia (U.S.A) coastal plain estuary with epsilon = 0.5.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALINATION REVERSE OSMOTIC MEMBRANES AND THEIR PREPARATION,
Shinetsu Chemical Co., Tokyo (Japan). (Assignee).
S. Arai, and F. Akiya.
U.S. Patent No. 4,111,810, 4 p, 2 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 331, September 5, 1978.

Descriptors: *Patents, *Desalination, *Waste water treatment, *Water quality control, Reverse osmosis, Membrane processes, Membranes, Semipermeable membranes, Separation techniques, Chemical properties, Strength, Chitin, Chitosan.

Semipermeable membranes useful in reverse osmosis and a process of preparing them comprises deacetylating naturally occurring chitin to produce chitosan. A film of chitosan salt is made from an acid diluted aqueous solution of the chitosan having free amino groups by neutralizing the acid groups, and then subjecting the film of chitosan to a chemical treatment with an organic acid. The chitosan is converted to the acetylated form, having a degree of acetylation from about 0.3 to 0.8, to produce the reverse osmotic membranes. The products have excellent chemical properties as well as mechanical strengths sufficient to withstand the pressure difference in the operating condition. (Sinha-OEIS)

FACTORS INFLUENCING USEFULNESS OF ANTITRANSPIRANTS APPLIED ON PHREATOPHYTES TO INCREASE WATER SUPPLIES,
California Univ., Davis.
D. C. Davenport, R. M. Hagan, L. W. Gay, B. E. Kynard, and E. K. Bonde.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 171, Price codes: A09 in paper copy, A01 in microfiche. Contribution No. 176, Water Resources Center, University of California 1978, p 181, 108 fig, 60 tab, 159 ref, 10 append. OWRT C-6030 (No. 5235)(4), 14-31-0001-5235.

Descriptors: *Antitranspirants, *Evapotranspiration, *Phreatophytes, *Water yield improvement, *Wildlife habitat, Ecological balance, Energy budget, Lysimeter, Micrometeorology, Photosynthesis, Saltcedar, Stomata, Riparian water loss, *Transpiration control, *Riparian phreatophytes.

The continuous availability of groundwater to riparian phreatophytic vegetation such as saltcedar (Tamarix sp.) and cottonwood (Populus sp.) results in large transpiration rates usually coincide with peak consumer demands for ground- and streamwater. Removal of this vegetation can cause ecological imbalances and be environmentally and aesthetically unacceptable. Spraying a nontoxic antitranspirant (AT) on phreatophyte foliage, on the other hand, may reduce transpiration losses and also preserve the vegetation. This research project therefore investigates: (1) the magnitude of water lost through transpiration by phreatophytes using gravimetric, lysimetric and energy budget techniques; (2) plant and environmental factors which influence the water relations of the vegetation, using porometer, pressure chamber, and gas-exchange measurements; (3) selection of suitable AT materials by laboratory and greenhouse screening tests; (4) field testing of ATs, sprayed from the ground and by air, for transpiration reduction; and (5) AT effects on terrestrial and aquatic wildlife of riparian habitats using acute toxicity and other experiments. Conclusions are made on: (1) phreatophyte transpiration rate as affected by environment, plant density, and species; and (2) the benefits of AT treatment, as an alternative to phreatophyte eradication, for water conservation, improvement in water quality, and preserving the environment and ecological balance. (Snyder-Calif, Davis)

DESIGN AND THE DESERT ENVIRONMENT: LANDSCAPE ARCHITECTURE IN THE AMERICAN SOUTHWEST,
Arizona Univ., Tucson. Office of Arid Lands Studies.
J. D. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 955, Price codes: A11 in paper copy, A01 in microfiche. Arid Lands Resource Information Paper, No. 13, October 1978, 216 p. 84 fig (inc. photos), 2 tab, 174 ref. OWRT W-211(No 6254)(2).

Descriptors: *Landscaping, *Southwest U.S., *Aesthetics, *Vegetation establishment, *Soil-water-plant relationships, *Drought resistance, *Drought-tolerance, Mulching, Design criteria, Lawns, Ornamentals, Shrubs, Trees, Desert plants, Shelterbelts, Drip irrigation, Water harvesting, Plant physiology, Erosion control, Xerophytes, Vegetation effects.

Landscape architecture (environmental design) in the hot, arid southwestern U.S. must respond to the extremes of climate, the distinctive landforms, and the vegetative communities that combine to create unique patterns within the desert landscape. Human comfort is defined and serves as a criterion for the manipulation of microclimates to achieve a relative sense of comfort within a hot arid environment. Methods of solar radiation control, wind control, and conservation of water resources are reviewed. The text is supplemented with many illustrations and drawings. Over 200 drought-tolerant plant species are listed for use in the desert landscape. Cultural information for each plant is included in a matrix, and many of the plants so described are represented photographicaly as well. In addition to the references used for the text, a computerized bibliography, includng abstracts, of related topics is added in the appendix.

Water uptake by plants during the processes of infiltration and redistribution may introduce considerable errors in actual leaching when calculations are based on preirrigation soil water deficit. The objective of this study was to measure and demonstrate the importance of this water uptake in causing a reduction in the actual leaching. (Skogerboe-Colordo State)

SUGAR CANE GROWTH IN RESPONSE TO MULCH AND FERTILIZER ON SALINE-ALKALI SUBSOILS,
Ministry of Overseas Development (England).
B. W. Eavis, and E. R. St. J. Cumberbatch.
Agronomy Journal, Vol 69, No 5, p 839-842, September-October, 1977. 2 fig, 2 tab, 8 ref.

Descriptors: *Mulches, *Sugar cane, *Crop response, Crop production, *Fertilizers, Fertilization, Nutrients, Salinity, Subsoils, Leaching, Land reclamation, *Saline soils, Alkalinity.

In many parts of the world where salinity or alkalinity limit crop yields, leaching is impracticable. In Barbados saline-alkali subsoils remained unproductive 6 years after they were exposed during earth-moving operations. The objective of this study was to devise agronomic techniques to restore these lands to sugar cane production. The effects of mulching and N-K fertilization were studied. Factorial field experiments in which bare plots and plots mulched with cut grass were treated with fertilizer at three rates were carried out at two locations (sandy clay and clay soil respectively). Sugar cane tillers and soil moisture contents were measured weekly, and root development fortnightly. After 9 months of growth bare plots failed to produce any marketable yield in contrast to mulched plots which gave up to 53 metric tons/ha (sandy clay) and 118 tons/ha (clay). There were no responses to fertilizer rate on bare land, but on mulched land 1.2 times (sandy clay) and 2.2 times (clay) more yield resulted from the high compared with the low fertilizer rate. 3D. Conservation In Domestic and Municipal Use

THE ECONOMICS OF WATER CONSERVATION,
East Bay Municipal Utility District, Oakland, CA.
D. G. Larkin.
Journal of American Water Works Association, Vol. 70, No. 9, 470-473, September 1978. 2 fig, 1 ref.

Descriptors: *Water conservation, *Economics, *East Bay Municipal Utility District(CA), *Costs, *Droughts, *Water management(Applied), *California, Water shortage, Water supply, Public relations, Water rates, Financing, Regulation, Water utilization, Fixed costs, Social aspects, Public utilities.

Response to the 1976-77 California drought by the East Bay Municipal Utility District (EBMUD), serving parts of Alameda and Contra Costa Counties, is described. Water conservation and management efforts consisted of: (1) imposition of 25-35% cutbacks in water use; (2) rate increases to compensate for reduced water sales, including basic $.15/100 cu ft charges and excess use charges; (3) use of $6.8 million in federal drought relief loans and grants; (4) a public information campaign; and (5) retention of the drought surcharge after restrictions were lifted and a further rate increase. Conclusions: (1) most water utility costs do not vary with amount of water sold; (2) when water sales decrease, rates must go up; (3) a permanent decrease in water use of perhaps 15-20% is likely to persist after restrictions are lifted, due to altered customer water-use habits (including water-saving devices and lessened waste); and (4) this permanent decline in water use plus drought-related cost increases will probably require additional rate increases. In the EBMUD case, there was an increase of $3 million in operating costs and $4.5 million in drought-related construction costs, together with a reduction of 66% in net operating revenue in fiscal year 1977. A 33% water rate increase and the federal funds enabled the district to manage until the end of 1977, when another rate increase was necessary. The cutbacks and rate increases were accepted with cooperation and understanding by customers. (Lynch-Wisconsin)

DUAL WATER SUPPLIES: AN IDEA FOR THE FUTURE,
National Water Well Association, Worthington, OH
M. R. Richard.
Water Well Journal, Vol. 30, No. 12, p 64-65, December 1978.

Descriptors: *Water supply, *Dual systems, *Recycling, Water quality, Water management(Applied), Groundwater, Water conservation.

Explored is the concept of dual water supply systems in which high quality water is used for drinking and cooking while lower quality water is used for other purposes. Water supplies can be classified as potable, subpotable, and nonpotable. Potable supplies would be of very high quality. Subpotable supplies might contain trace chemicals but no bacteria. Nonpotable supplies would be recycled wastewater used for irrigation, air conditioning and ground-water recharge. The advantages of dual water systems are: they conserve high quality water; total wastewater discharge and pollution are reduced; they might be cheaper than developing new fresh-water sources or treating large supplies. Dual water supplies can be used in regional water management. Water needs for a city are considered in the light of the quality and amount of available supplies. Examples of industrial, municipal and agricultural dual systems are given. The implementation of dual systems is compatible with increased ground-water development. Ground water is generally of higher quality than surface water and can be developed and treated less expensively. Dual systems are now only feasible for new systems rather than existing ones due to the high cost of redesigning existing pipelines to handle multiple grades of water. (Purdin-NWWA)

MANAGEMENT OF RURAL WATER SUPPLY PEAK FLOW RATES,
Utah Water Research Lab., Logan.
T. C. Hughes
Journal of the Water Resources Planning and Management Division, American Society of Civil Engineers, Vol. 104, No. WR1, Proceedings Paper 14148, p 129-137, November 1978. 2 fig, 5 tab, 4 ref.

Descriptors: *Water supply, *Rural areas, *Management, Design, Water distribution, Design standards, Water demand, Domestic water, Peak discharge, Flow, Flow rates, *Utah, *Statistical analysis, Flow restriction devices.

Flow rates in lines serving 4 and 15 families were recorded continuously during two summer peak periods on a low-density rural domestic water system in Utah. During the second summer, the potential flow rates at individual services were cut almost in half (from 11.0 gal/min to 6.3 gal/min average) by installing a small orifice in each service line. Analysis of the flow rate data and interviews with the water users produced conclusions which included the following: (1) Peak demands on this type of system almost never exceed 7 gal/min/service; and, therefore, the customers were essentially unaware of any reduction in the quality of service; (2) Distribution line peak flows were reduced by 7% to 20% by the orifices and could have been reduced much more by a slightly smaller orifice; and (3) Management of peak flows by simple orifices has important potential for sections of systems with marginal distribution line capacities. MONIUM EFFECTS ON NUTRIENT TION ABSORPTION BY WHEAT,
stern Australia Dept. of Agriculture, South th.
J. Cox, and H. M. Reisenauer.
Agronomy Journal, Vol. 69, No. 5, p 868-871, September-October 1977. 1 fig, 3 tab, 18 ref.

Descriptors: *Nutrients, Fertilizers, Fertilization, *Cations, *Absorption, *Wheat, Nitrogen, Potassium, Calcium, Zinc, Magnesium, Manganese.

Additions of small amounts of NH4 to adequate (-)N03 culture have been shown to increase crop yield and total N content, and to decrease the plant's content of metal cations. The magnitudes of these effects can be appreciable. Accordingly, experiments were done to elucidate their mechanisms, and to evaluate their roles in crop production. Wheat was grown in the greenhouse in dilute constant-composition cultures that supplied, in factorial combination, three levels of NH4 with four levels ofeither K, Ca, Mg, Mn, or Zn. Intake of mineral cations increased with the concentration of the ion in solution and was decreased by added NH4. (Skogerboe-Colorado State)

GROWTH AND YIELD OF SPRING WHEAT AS INFLUENCED BY SHELTER AND SOIL WATER,
Agricultural Research Service, Mandan, ND. Northern Great Plains Research Center.
A. B. Frank, D. G. Harris, and W. O. Willis.
Agronomy Journal, Vol. 69, No 6, p 903-906, November-December 1977. 1 fig, 6 tab, 20 ref.

Descriptors: *Windbreaks, *Wheat, Irrigation, Irrigation effects, *Crop production, Crop response, *Soil water, Wind velocity, Leaves.

In the Northern Great Plains, windbreaks have historicaly been used to protect crops and soils from winds, but data on the effects of windbreaks on growth and yield of small grains is limited. 'Waldron' wheat was grown on Parshall fine sandy loam with and without shelter (slat-fence enclosures), both with and without irrigation, to determine the effects of soil water and shelter on wheat growth and yield. In 1973 and 1974, plant height, tiller production, leaf area index, specific leaf weight, and dry matter were measured at tillering, heading, and grain-filling growth stages. Also, grain yield, kernel weight, number of heads, straw yield, and plant height were measured at crop maturity. (Skogerboe-Colorado State)

Agronomy Journal, Vol 69, No 6, p 906-910, November-December 1977. 6 fig, 1 tab, 19 ref.

Descriptors: Micro environment, *Windbreaks, *Wheat, Irrigation, Irrigation effects, *Crop production, Crop response, *Soil water, Wind velocity, Leaves.

Field windbreaks have been planted primarily for soil erosion control; subsequently, research has shown that windbreaks have an effect on microclimate and on growth and yield of crops. Other research has shown that plant water relations respond to changes in microclimates. The present work was undertaken to determine the effect of microclimate changes induced by a slat-fence windbreak on the plant water relations of field-grown wheat. Slat-fence barriers were used as windbreaks for studying effects of shelter-modified microclimate on plant water relations of 'Waldron' spring wheat, grown on Parshall fine sandy loam under irrigated and dryland soil water regimes. Data were collected on leaf water potential, xylem water potential, stomatal diffusion resistance, canopy temperature, soil water potential, soil water extraction, and grain yield. TILLAGE EFFECTS ON WINTER WHEAT PRODUCTION WHERE THE IRRIGATED AND DRYLAND CROPS ARE ALTERNATED,
P. W. Unger.
Agronomy Journal Vol. 69, No. 6, p 944-950, November-December 1977. 2 fig, 5 tab, 11 ref.

Descriptors: *Wheat, Irrigation, *Irrigation effects, *Crop production, *Cultivation, Crop response, Soil water, Soil moisture, Irrigation efficiency, Dry farming.

While adequately irrigated winter wheat yields are relatively high, dryland wheat yields in the southern Great Plains are only about 700 kg/ha with continuous cropping and about 1,000 kg/ha on a harvested area basis after fallow. This study was conducted to determine if yields could be increased where irrigated and dryland wheat crops are alternated on the same plots. Tillage effects were also studied. DRIP STUDY SHOWS UP TO 30% WATER SAVINGS,
J. Schleicher.
Irrigation Age, Vol. 11, No. 4, p 37, 69, January, 1977. 1 fig.

Descriptors: Irrigation, Irrigation practice, Irrigation systems, *Irrigation efficiency, *Orchards, Crop production, *Water conservation, *Drip irrigation.

Tree crop farmers repeatedly hear how efficient drip irrigation is in relation to either sprinkler or furrow water application methods. But just how does 'drip efficiency' stack up in terms of comparative water savings with sprinkler and furrow techniques That question is the subject of a joint research project currently being sponsored by the University of California and the California Department of Water Resources on citrus farm near Parlier, California. The study centers around a 40-acres block of 8-year-old Navel oranges, chosen for the uniformity of soil, water and tree conditons. The acreage is divided into 12 five-row blocks permitting the researchers to create four replications each of the three irrigation methods. (Skogerboe-Colordo State)

MAKING THE DESERT FLOWER: IRRIGATING CALIFORNIA'S IMPERIAL VALLEY,
R. Mallory.
Irrigation Journal, Vol 27, No 5, p 19-20, 27, September-October, 1977, 2 fig.

Descriptors: *California, Water conservation, Water quality, *Crop production, Salinity, Saline soils, Furrow irrigation, *Imperial Valley(Calif).

'Making the desert flower' is a description heard many times in the irrigated farmlands of the West. But perhaps nowhere is the description more appropriate than in California's Imperial Valley. With less than three inches of rain per year in this southern-most California Valley, the land could not even be initiated into dryland wheat production as was much of the rest of the state. (Skogerboe-Colorado State)

CALCULATING THE COST OF EACH IRRIGATION,
Texas A and M Univ., Lubbock. Agricultural Research and Extension Center.
L. New.
Irrigation Age, Vol 11, No 9, p 56-57, July-August, 1977. 2 tab.

Descriptors: Irrigation, *Irrigation practices, Irrigation efficiency, Pumping, Economics, *Costs.

In view of today's energy costs, excessive irrigation amounts and poor field distribution patterns can seriously damage the profitability of a farming enterprise. You may have a good idea of your total pumping time, and your annual fuel costs per acre of land. But the best lead to your irrigation efficiency is to know how much water is pumped, and where it's going. You can obtain those figures by knowing your irrigation well capacity and the number of hours that a well or group of wells are pumped to irrigate a specific acreage. The specific acreage can be an irrigation set, a section of land, a field of corn, or even the actual acreage irrigated by a center pivot sprinkler. (Skogerboe-Colorado State)

CONTROLLING SEDIMENT IN SURFACE RUNOFF,
Agricultural Research Service, Kimberly ID. Snake River Conservation Research Center.
A. Humphreys.
Irrigation Age, Vol. 12, No. 1, p 22, 24, September, 1977. 1 fig.

Descriptors: *Sediments, Nutrients, Runoff, *Irrigation effects, Pesticides, Fertilizers, Salts, *Sediment control.

Irrigators are sometimes criticized for contaminating downstream waters with sediment, nutrient and pesticides contained in surface runoff from irrigation. Research studies have shown that the concentrations of dissolved fertilizer nutrients, pesticides and salts in surface runoff are essentially the same as those in the applied irrigation water. Thus, water passing over the soil surface does not usually pick up additional amounts of these materials. Significant increases in nutrient or pesticide concentration do occur when these materials are applied by adding them to the irrigation water or when the material falls into the water from spray application or is washed from the plants by rain. When fertigation and herbigation are practiced, runoff water should be retained in a reuse pond and not allowed to leave the farm or flow into natural streams. (Skogerboe-Colorado State)

ZINC NUTRITION OF RICE AS INFLUENCED BY RATES OF GYPSUM AND ZN FERTILIZATON OF ALKALI SOILS,
Punjab Agriculture Univ., Ludhiana. Dept. of Soils.
P. N. Takkar, and T. Singh.
Agronomy Journal, Vol. 70, No. 3, p 447-450, May-June, 1978. 2 fig, 2 tab, 15 ref.

Descriptors: *Rice, Nutrient requirements, *Zinc, *Gypsum, Alkaline soils, *Fertilization, Reclamation, Crop response, Submerged plants, *Calcium.

Three field experiments were conducted on Zn deficient alkali soils, two on Natraquic calciorthids, and one on Aquic Camborthids, to determine the effect of gypsum and Zn fertilization alone and in combination on the Zn nutrition of rice IR 8. Three rates of gypsum and three rates of Zn and their possible combinations were tried. At all the three locations, the growth of the rice crop was very poor and exhibited Zn deficiency symptoms in control plots. The yield and Zn uptake was higher in alkali soil high in CaCO3 and low in pH than in soils low in CaCO3 and high in pH. Gypsum application markedly decreased the soil pH, and significantly increased the yield and Zn uptake by rice. Zinc application decreased the pH, but not so appreciably as did gypsum; and markedly increased the available Zn from deficient to adequate levels. Optimum response of rice to Zn was observed at 11.2 kg Zn/ha except in one of the Natraquic calciorthids where it was 22.4 kg Zn/ha. The beneficial effect of Zn application to rice grown on the alkali soils under investigation was far more than that of gypsum. (Skogerboe-Colorado State)

LAWN SPRINKLER DISTRIBUTION PATTERNS,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
G. L. Kerr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 698, Price codes: A05 in paper copy, A01 in microfiche. M. S. Thesis, May 1978. 72 p, 16 fig, 7 tab, 8 ref, 2 append. OWRT B-035-WYO(1), 14-34-0001-7201.

Descriptors: *Sprinkler irrigation, *Lawns, *Distribution patterns, *Wyoming, *Application rates, *Christiansen's Uniformity Coefficient.

Distribution patterns of six typical lawn sprinkler types were determined during the summer of 1977. Tests were conducted on four sprinklers from each type under three pressure levels. Christiansen's Uniformity Coefficient (UCC) was calculated for the original pattern and for each of nine different overlaps of the sprinklers. Overlaps required to achieve minimum acceptable UCC values were then determined. The output of each sprinkler was measured and application rates were calculated for individual pattern sizes at the three pressure levels. Two important factors for effective lawn watering include: (1) usage of the proper overlap for an individual sprinkler type, and (2) determination of the application rate in order to apply the proper amount of water for a given soil type

RECIPROCABLE SPRINKLER,
G. Brandl.
U.S. Patent No. 4,109,866, 4 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2197, August 29, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Application equipment, Water delivery.

A sprinkler designed to irrigate a certain sector of the ground comprises an upward sloping barrel which rotates about a vertical axis and which terminates in a nozzle. It carries two vertically oscillatable arms that are alternately effective to drive the barrel on a forward swing and on a return swing under the impact of the emitted water spray. The reverse-driving arm has a deflecting head which, on the return swing, lies in line with the nozzle and has two hands adjoining each other at an obtuse angle, i.e. a ramp face sloping upward in a radially outward direction and a reaction face of larger area including an acute horizontal angle with the radial direction. When the head is lowered into the path of the spray by an end stop, the impact of the water upon the ramp face pulls the reaction face into line with the nozzle against the force of a restoring spring. Another such spring, including a lost-motion connection, goes into effect in a position in which the spray impinges squarely upon the reaction face, thus tending to hold that face aligned with the nozzle but allowing the head to yield under excessive water pressure. (Sinha-OEIS)

Journal of the Irrigation and Drainage Division, Proceedings of ASCE, Vol. 101, No. IR4, p 251-264, December 1975. 8 fig, 3 tab, 6 ref.

Descriptors: *Sprinkler irrigation, *Wind velocity, *Irrigation, *Irrigation design, *Irrigation efficiency, *Distribution patterns.

The study concludes that: (1) Due to the fact that wind speed and solar radiation were not correlated in the data on which this study was based, it was possible to show that the wind speed was not directly contributing to the water loss during sprinkling. (2) A method of sprinkler patterns reconstruction was developed, which yielded representative interpolated patterns, as well as reliable extrapolated patterns for no-wind conditions. (3) It was theorized and demonstrated that when the centers-of-mass of consecutive distribution patterns are equidistant, the water distribution is likely to be the optimal that can be achieved under the major constraints of the system. DIFFERENTIAL EFFECT OF BERMUDA AND BAHIAGRASSES ON SOIL CHEMICAL CHARACTERISTICS,
Georgia Univ., Athens. Dept. of Agronomy
K. H. Tan, E. R. Beaty, R. A. McCreery, and J. B. Jones.
Agronomy Journal, Vol. 67, No. 3, p 407-411, May-June, 1975. 5 fig, 2 tab, 20 ref.

Descriptors: *Grasses, *Forage grasses, Forages, *Organic matter, Crop response, *Soil chemical properties, Soil chemistry, Nitrogen, Fertilization, *Bermudagrass, *Bahiagrass.

The use of bermudagrass and bahiagrass has attracted considerable research attention with respect to forage production. Little information is available on the influence of these grasses on soil properties; and a direct comparison to effectively estimate the differential effect of bermudagrass and bahiagrass on major soil chemical properties is still lacking. A randomized split plot experiment was carried out in three replicates using a Montevalo soil planted with several bermudagrass and bahiagrass varieties, receiving annual application of 0, 224, and 672 kg N per ha from 1967 to 1970. In 1971 herbage and soil samples were collected for yield and chemical analysis. The results indicated the absence of differences in the effects of the grasses on soil pH, N, P, K, and Ca, but there were differences in organic matter contents. (Skogerboe-Colo St)

YIELD OF DRYLAND GRAIN SORGHUM AS AFFECTED BY ANTITRANSPIRANT, NITROGEN, AND CONTRIBUTING MICRO-WATERSHED.
New Mexico Agricultural Experiment Station, University Park
H. D. Fuehring

Agronomy Journal, Vol. 67, No. 2, p 255-257, March-April, 1975. 3 tab, 11 ref. OWRT B-029-NMEX(1).

Descriptors: *Antitranspirants, *Rain water, Surface runoff, *Drought, *Moisture stress, Sorghum, Nitrogen, Watershed management, Fertilizers, *Atroazine, Rain-water efficiency, Micro-Watersheds.

In the semi-arid Great Plains yields of grain sorghum (Sorghum bicolor(L.) Moench) are always limited by lack of rainfall or soil moisture during some part of the growing season. The purpose of this study was to determine if minimal land shaping practices in combination with antitranspirant application would increase yield levels of dryland grain sorghum. Variables were width of watershed, width of growing bed, applied N, and foliarly applied antitranspirant combined in a central composite experimental design. Use of contoured compacted bare micro-watersheds increased grain sorghum yields of adjacent growing beds considerably even in two relatively wet years. However, yields of the entire area (growing bed plus watershed) decreased. Atrazine (2-chlor-ethylamino-6-isopropylamino-s-triazine) as an antitranspirant at 0.2 to 0.3 kg/ha effectively increased sorghum grain yields under conditions of solid planting and adequate nitrogen. The antitranspirant-nitrogen interaction was especially positive under conditions of moisture stress. Since most grain sorghum is grown under conditions where moisture stress is likely, further work on the use of antitranspirant is warrented in order to establish the conditions of response.

YIELD RESPONSE TO SOIL WARMING: AGRONOMIC CROPS,
Oregon State Univ., Corvallis. Dept. of Soil Science.
K. A. Rykbost, L. Boersma, H. J. Mack, and W. E. Schmisseur.
Agronomy Journal, Vol 67, p 733-743, Nov-Dec 1975. 7 fig, 2 tab, 9 ref. OWRT B-039-ORE(5) and B-044-ORE(2).

Descriptors: Reject energy, *Soil temperature, *Crop response, Cooling water, Heated water, *Waste heat.

Waste heat appears in the form of warm condenser cooling water from power generating plants. It has been proposed to use this water with temperatures ranging from 25 to 40C for warming soils by pumping it through buried pipes. Experiments were conducted to determine the effect of warming soils in this manner on the growth rates and yields of several crops. The proposed system was simulated with parallel electrical heating cables buried 92 cm deep and 183 cm apart. Heat source temperatures ranged from 35 to 38C during the growing period. Heating increased the average temperature of the soil layer from 0 to 100 cm deep by about 10C. The average temperature increase of the 0 to 10 cm soil layer was < 3C. The crops tested were field corn (Zea mays L.), sudangrass (Sorghum vulgare sudanese), sughum-sudangrass hybrid (Sorghum bicolor L.), and tall fescue (Festuca arundinacea). The yield increases, expressed as percentages of yields obtained on unheated plots, ranged from 19% for tall fescue to about 50% for sudangrass. The yield increases varied widely from year to year for the same crop. The highest yield increases occurred during years when the yields on unheated plots were lowest. Correlations between yield increases and yields from unheated plots were highly significant. A yield decrease occurred only with tall fescue during the summer. Soil heating appears to be most effective when climatic conditions and management factors are limiting. The effects of higher soil temperatures on growth rates were greatest in the early spring.

MAGNITUDE AND FREQUENCY OF FLOODING ON THE MYAKKA RIVER, SOUTHWEST FLORIDA,
Geological Survey, Tallahassee, FL., Water Resources Div.
K. M. Hammett, J. F. Turner, Jr., and W. R. Murphy, Jr.
Water-Resources Investigations 78-65 (open-file report), 1978. 40 p, 15 fig, 8 tab, 11 ref.

Descriptors: *Flood plains, *River basin development, *Watershed management, *Flood control, *Flood profiles, Flood peak, Flood frequency, Flood routing, Dikes, Flood forecasting, Analytical techniques, *Florida, *Myakka River basin(FL), Sarasota County, Manatee County.

Increasing numbers of urban and agricultural developments are being located on waterfront property in the Myakka River flood plain in southwest Florida. Under natural conditions, a large depression, Tatum Sawgrass, was available as a flood storage area in the upper Myakka River basin. Construction of dikes across the lower part of Tatum Sawgrass has restricted use of the depression for temporary storage of Myakka River flood water overflow, and has resulted in increased flood-peak discharges and flood heights in downstream reaches of the Myakka River. The difference between natural and diked condition flood-peak discharges and flood heights is presented to illustrate the effects of the dikes. Flood-peak discharges, water-surface elevations and flood profiles also are provided for diked conditions. Analytical procedures used to evaluate diking effects are described in detail. The study reach includes Myakka River main stem upstream from U.S. Highway 41, near Myakka Shores in Sarasota County, to State Road 70 near Myakka City in Manatee County (including Tatum Sawgrass and Clay Gully), and Blackburn Canal from Venice By-Way to Myakka River. INCREASING EFFICIENCY OF AQUATIC PLANT MANAGEMENT THROUGH PROCESSING,
Wisconsin Univ.-Madison. Water Resources Center.
R. G. Koegel, S. H. Sy, H. D. Bruhn, and D. F. Livermore.
Hyacinth Control Journal Vol. 11, p. 24-30, June 1973. 9 fig, 3 tab, 13 ref. OWRT B-058-WIS(2), 14-31-0001-3665.

Descriptors: *Harvesting, *Aquatic weed control, *Mulching, *Mechanical equipment, *Treatment, Feed, *Wisconsin, Dane County(Wis).

While mechanical harvesting is generally considered an ecologically sound approach to the control of excessive aquatic plant growth, its application has been limited by high unit costs. The efficiency of mechanical harvesting can be greatly increased by (1) reducing the weight, (2) reducing the volume, and (3) improving the handling characteristics of the harvested plant material by means of processing. Possibilities for utilization and disposal of harvested aquatic plants are also dicussed.

CONTROL OF 1973 MISSISSIPPI RIVER FLOOD,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Lower Mississippi Valley Div.
R. I. Kaufman.
Journal of the Water Resources Planning and Management Division, American Society of Civil Engineers, Vol. 104, No. WR1, Proceedings Paper 14169, p 105-121, November 1978. 4 fig, 1 tab, 4 ref.

Descriptors: *Mississippi River, *Floods, *Illinois, *Gulf of Mexico, Flood control, Hydraulics, Levees, Rivers, Seepage, Waves(Water), Flood damage, *Mississippi River flood, Flood control plan.

In 1973 a major flood occurred on the Mississippi River. Much of the alluvial valley of the river between Alton, Illinois, and the Gulf of Mexico is protected against floods by Federally constructed flood control works. As some of these systems were not complete at the onset of the flood, a major flood fight was required to safeguard the valley. Miles of levee had to be raised to provide proper protection. Other problems requiring flood-fight efforts were seepage under levees, scour at levees and structures, and riverbank failures. Even though major emergency efforts were required, the Federal flood control systems were effective and of great value in controlling the flood. The projects prevented the inundation of 26,000 sq miles (67,500 sq km) of land and reduced flood damages by over $14,000,000,000. However, the losses sustained indicate the need to complete authorized works and possibly expand existing projects or initiate new projects in some areas, or both. (Lee-ISWS)

FORECAST OF THE FLASH FLOOD HYDROGRAPH ON THE INGODA RIVER,
V. A. Bel'chikov.
Soviet Hydrology: Selected Papers, Vol 16, No 1, p 21-25, 1977. 3 fig, 2 tab, 6 ref. Translated from Transactions of the Hydrometeorological Scientific Research Center of the USSR (Trudy GMTs), No. 183, p 56-65, 1977.

Descriptors: *Flood forecasting, *Flash floods, *Hydrograph analysis, *Mathematical models, Runoff forecasting, Water levels, Rivers, Hydrographs, Rainfall-runoff relationships, Infiltration, Evaporation, Foreign research, Foreign countries, Analytical techniques, Precipitation(Atmospheric), Discharge(Water), Floods, *USSR, *Ingoda River(USSR).

The results of the use of a mathematical model of flash flood formation in developing a method of short-range forecasting the runoff hydrograph for the Ingoda River basin (upstream of Chita city) were reported. The mountain topography, relatively steep slopes, and a developed river network promote the rapid discharge of rainwaters into the main channel network and the formation of high floods. Flash floods with brief and sharp rises and drops in level are fairly frequent. Data on discharges, precipitation, and the atmospheric moisture deficit for the period from 1952 to 1971 were used to develop a method of short-range flash flood forecasting. Since operational information contains only stage data, discharge curves were used. An estimate of the control forecasts lead to the conclusion that the developed model can be used by means of a computer to issue continuous short-range forecasts of flash flood discharges 36 hours in advance. Computations on the basis of observations in the Ingoda reach in question from 1952 to 1971 showed that the computed and actual discharges agreed very well. (Humphreys-ISWS)

Descriptors: *Water resources development, *Planning, *Water transfer, *Inter-basin transfer, Diversion, Spatial distribution, Geographical regions, Runoff, Rivers, Withdrawal, Water quality, Reservoirs, Water importing, Foreign countries, *USSR.

The principles of a scientific concept developed under the guidance of the author and reported at the Scientific Council of the Institute of Geography, USSR Academy of Sciences, were described. The general scientific and economic permises of the redistribution of water resources in the USSR, including some alternatives, were analyzed. The experience gained in the construction of one of the largest hydraulic engineering complexes, the Volga-Kama cascade of reservoirs, was discussed. General considerations were presented on the need and possibilities of using additional freshwater in southern regions in relation to the prospects for their development. Particular attention was given to the intensification of water management and to water quality, and the geographic aspects of investigations in this field were outlined. (Humphreys-ISWS)

THE COLONIZATION OF CABORA BASSA, MOCAMBIQUE, A NEW MAN-MADE LAKE, BY FLOATING AQUATIC MACROPHYTES,
Loxton, Hunting and Associates, Gaberone (Botswana).
W. J. Bond, and M. G. Roberts.
Hydrobiologia, Vol. 60, No. 3, p 243-259, 1978. 5 fig, 7 tab, 23 ref.

Descriptors: *Lake Cabora Bassa(Mocambique), *Impoundments, *Floating plants, *Aquatic weed control, *Water hyacinth, *Salvinia molesta, Vegetation establishment, Mozambique, Lakes, Artificial lakes, Eichhornia crassipes, Drawdown, Nutrients, Eutrophication, Water pollution effects, Lake Kariba(Mocambique), Zambezi River, Limiting factors, Succession, Pistia stratiotes, Hydroelectric plants, Multiple-purpose projects, Macrophytes, Pesticides, Mechanical control, Insects.

Predicted extensive macrophyte growth by the floating weeds Salvinia molesta and Eichhornia crassipes (water hyacinth) during filling of Lake Cabora Bassa (Mocambique), a new impoundment of the Zambezi River, had not occurred by the end of 1975. Filling begun in December 1974, was very rapid and surface currents carried large quantities of weed to the outflow at the lake's eastern end. When lake levels stabilized, macrophytes were concentrated in the extreme east and west, with scattered mats on northern shores of the central basins. The Carinde narrows at the western end impeded weed passage, particularly after surface currents ceased and easterly winds dominated plant dispersal. Storm-related winds at the end of the year led to some redistribution of the largely stable mats. Not more than 1% of the surface area was ever covered by floating macrophytes. Initially, Salvinia, Eichhornia, and Pistia stratiotes were present in large quantities, then Salvinia was rapidly suppressed by Pistia, and then both species by Eichhornia, which was completely dominant by the end of the year. Eichhornia grew rapidly until September when rates diminished, and in Gorge Basin signs of nutrient deficiency developed. By the end of 1975 no offsets were being produced by Eichhornia for unknown reasons. Rapid drawdown in july 1975 destroyed nearly 50% of the weed mats, and two insects may have helped control populations. Harvesting and pesticides eliminated weeds in the central basins and parts of the Gorge Basin. Results are contrasted with Lake Kariba. (Lynch-Wisconsin)

ESTABLISHMENT OF NATIVE PLANTS FOR THE REHABILITATION OF PARAHO PROCESSED OIL SHALE IN AN ARID ENVIRONMENT,
Utah State Univ., Logan. Inst. for Land Rehabilitation
C. M. McKell
In: The Reclamation of Disturbed Arid Lands, ed. by R. A. Wright University of New Mexico Press, Albuquerque, p 13-32, 1978. 1 tab, 2 fig, 55 ref.

Descriptors: *Oil shales, *Revegetation, *Baseline studies, *Land reclamation, Infiltration, Rainfall-runoff relationships, Water yield, Range manage-

ment, Soil surfaces, Rocky Mountain region, Vegetation establishment, Soil stabilization.

Oil shale deposits, a large potential energy source, are found in Colorado, Utah, and Wyoming. Although their exploitation has yet to reach commercial stage, government officials, in anticipation, have begun to develop techniques for the rehabilitation of areas disturbed by such exploitation. Accordingly, 5000-acre tracts of Federal land in Utah and Colorado were leased for prototype oil shale development. A baseline data gathering program began in 1975 on these tracts and has subsequently identified many potential problems. In the Uinta Basin in northeastern Utah and to set forth techniques suitable for the establishment of native shrubs in these areas. Basic components include: (1) use of native plant species, (2) transplanting container-grown plants to avoid direct seeding, (3) soil surface shaping to induce runoff and terraces to increase infiltration, (4) soil surface stabilization to promote runoff and reduce soil particle movement, (5) topsoil use limited to trenches where plants can be grown, (6) fertilizer application only in required amounts, and (7) supplemental irrigation. Actual operation may require modification of these techniques. (Tickes-Arizona)

Descriptors: *Aqueducts, *Paleohydrology, *History, *Conveyance structures, Dating, Water resources development, Archaeology, Diversion structures, Hydrologic aspects, Structural analysis, Adaptation, Architecture, Masonry, Israel.

The construction and operation of the recently excavated water supply system of the ancient Roman city of Emmaus is described. The system is composed of sophisticated installations for groundwater collection, including two parallel aqueducts built on two separate sources of water: the upper is a masonry tunnel approximately 25 meters long, penetrating horizontally and collecting the water at ground level. The tunnel, .30 m wide and 1.20 m high is built of ashlar and contains two inspection shafts; the lower channel runs from a stone craft which penetrates vertically to the groundwater, an example of a subterranean artificial spring feeding a water supply system. This aqueduct, built completely underground, is composed of three elements: an artificial spring, a vaulted room that protects it, and an approach shaft from the surface. Based on archeological and historical evidence, it is assumed that this hydraulic installation was constructed in the fifth century A.D. Systems similar to this one have been uncovered in several eastern Roman cities dating from the third to the fifth centuries A.D. Architecturally, these systems are characteristic of Roman construction in the eastern parts of the empire and utilize the ashlar masonry technique. (Tickes-Arizona)

STOCHASTIC MODELING FOR PREDICTING FREQUENCY DISTRIBUTION OF STAGES IN THERMAL LAKES AT FUTURE PLANNING HORIZONS,
Utah Water Research Lab., Logan.
L. D. James, D. S. Bowles, and S. J. Burges.
In: Desertic Terminal Lakes, Proceedings of the International Conference on Desertic Terminal Lakes. Weber State College, Ogden, Utah, Deon C. Greer, Ed. Utah Water Research Lab. Publication. Sept 1977. OWRT B-153-UTAH(1), 14-34-0001-8122.

Descriptors: *Stochastic models, *Frequency distribution, *Lake stages, Planning, *Forecasting, Model studies, Land use, *Desertic terminal lakes.

Planners and engineers responsible for dealing with fluctuating terminal-lake water levels in planning land use along terminal-lake shorelines, or for water resources management in terminal-lake basins need information on stage-frequency and how it is affected by their plans. Comparison of the alternative methods for deriving the needed relationships finds stochastic modeling (operational hydrology) techniques superior. The method (1) develops a stochastic model that preserves the distributional and persistence properties of the historical sequences of surface inflow, groundwater inflow, precipitation on the lake, and evapotranspiration, (2) inputs generated sets of these four sequences to a water balance model to estimate corresponding sequences of lake stage commencing at the known present lake level, and (3) analyzes these sequences to establish lake stage-frequency distributions at each year to some planning horizon. By using rainfall-runoff relationships to adjust inflows, and method estimates how variations in land and water use in the tributary basin affect lake stage.

4B. Groundwater Management

PUBLIC GROUNDWATER SUPPLIES IN KANE COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller, and E. W. Sanderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 617, Price codes: A05 in paper copy, A01 in microfiche. ISWS Bulletin 60-22, 1978. 92 p, 3 fig.

Descriptors: *Water supply, *Illinois, *Groundwater resources, Unconsolidated aquifers, Well data, Gravels, Sand aquifers, Bedrock, Sandstones, Dolomite, Groundwater availability, Groundwater, Hydrology, Hydrogeology, Water sources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells, Geology, Aquifers, *Kane County(Ill), Dissolved minerals, Water bearing formations.

All available information on production wells used for public water supplies in Kane County, Illinois, was presented. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. The report included separate descriptions for 34 public water supply systems furnishing water to 16 municipalities, 14 subdivisions, and 4 state institutions in Kane County. These were preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for public use. Individual production wells for each supply were described in the order of their construction. The description for each well included the aquifer or aquifers tapped, data drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses.(Humphreys-ISWS)

HIGH PLANS - OGALLALA GROUNDWATER STUDIES,
Kansas Water Resources Board, Topeka.

J. A. Power, Jr.
(1978) Kansas Water News, Vol. 21, No. 1 and 2, p 4, 46-47.

Descriptors: *Aquifer management, *Groundwater, Investigations, *Model studies, Evaluation, Management, Computer models, Oil, Water supply, Overdraft.

The Ogallala - High Plains economy is being threatened by lowering of the water table and declining petroleum production. Economic disaster can be averted by regional investigations. The Economic Development Administration - High Plains Council Study is a multi-agency, six-state study of the declining water resources of the Ogallala. Its objectives are: (1) determine development alternatives; (2) identify and describe policies and actions for carrying out development strategies, and (3) evaluate local, state and national implications of these alternative development strategies. The U.S. Geological Survey-Ogallala Study is a four-year study of the High Plains aquifer system. Its objectives are to: (1) Describe the quantity and quality of water resource and the hydrologic budget; (2) Develop a regional water resources data storage and retrieval system; (3) Develop data collection networks to monitor future water use, water quality changes and water storage changes; (4) Design and develop digital computer models of the aquifer system; (5) Demonstrate the applicability of the models and provide a hydrologic basis for the economic evaluation of management alternatives. Computer models of the High Plains aquifer system will predict the future state of the system with a given knowledge of future stress. They will be a vital tool in groundwater management. (Purdin-NWWA)

MODEL AIDS PLANNERS IN PREDICTING RISING GROUND-WATER LEVELS IN SAN BERNADINO, CALIFORNIA,
Geological Survey, Laguna Niguel, CA.
W. F. Hardt, and C. B. Hutchinson.
Ground Water, Vol. 16, No. 6, p 424-431, November-December, 1978. 9 fig, 9 ref.

Descriptors: *Water levels, *Artificial recharge, *Mathematical models, *Groundwater, Natural recharge, Pumping, Monitoring, Water management(Applied), Artesian heads, *California, *San Bernadino(Calif).

Problems in the orderly development of the current water-management program in the San Bernadina Valley could result from imported water from Northern California recharging the ground water system. Intensive agricultural development in this area led to a decline in artesian water levels from 50 feet or more above land surface to 50-150 feet below land surface. If the artesian head were to again extend above land surface due to artificial recharge, buildings, public works and utilities could be damaged. A mathematical well-response model was developed by Durbin and Morgan to predict water-level changes that would occur in selected wells due to artificial recharge. In this study, a conceptual model of the flow mechanics and geologic framework of the basin was first developed. Then, using the data from the analysis of conceptual model, a mathematical model was devised to represent the prototype. The solution to the problem is based on the combined influence of natural recharge, artificial recharge, and groundwater pumping. The greatest unknown is the quantity and distribution of natural recharge. Artificial recharge and pumpage can be controlled. In addition to the predictive mathematical model, key monitoring wells are located between the recharge sites and the former swampy area to reflect the effects of the recharge program. (Purdin-NWWA)

SURFACE WATER VS. GROUND WATER,
National Water Well Associaton, Worthington, OH.
T. E. Gass.
Water Well Journal, Vol. 30, No. 12, p 26-27, December, 1978.

Descriptors: *Groundwate, *Surface water, *Water utilization, Economics, Water treatment, Aquifers, Reservoirs, Reliability

Although ground water accounts for 95 percent of the U.S. fresh water supply, only 25 percent of our total water needs are being met through the use of ground water. This is strange in view of the fact that ground water usually can be developed and produced cheaper and faster than surface water Operation and maintenance costs for ground water systems are up to 40 percent lower than surface water systems. Aquifers are better than surface reservoirs in that they are not subject to water loss or flooding. Also, they are protected from contamination by airborne particulate matter, organic matter and algae growth. New regulations under the Safe Drinking Water Act will probably raise surface water treatment costs but not ground water. Surface water supplies have been promoted by special interest groups for various monetary and political reasons. Ground water is a superior product and in this era of broader political and economic awareness it should be recognized as such and given precedence over surface water. (Purdin-NWWA)

IMPROVED TECHNIQUES FOR EVALUATING CARBONATE WATERFLOODS IN WEST TEXAS,
Exxon Co., Houston, TX.
C. J. George, and L. H. Stiles.
Journal of Petroleum Technology, Vol. 30, No. 11, p 1547-1553, November, 1978. 12 fig, 1 tab, 5 ref

Descriptors: *Water flooding, *Oil reservoirs, *Injection, Oil wells, Injection wells, *Texas, *Waterfloods.

Detailed studies of three waterfloods in Permian carbonate reservoirs of west Texas resulted in new depletion plans with major operating changes, including infill drilling and pattern modifications. An important aspect of these studies was the close coordination of geologic and engineering work that produced a consistent approach to the relationship between reservoir depletion and field procedures used to improve ultimate recovery. Problems in waterflooding Permian carbonates of west Texas occur basically because of the stratified nature of the pay, discontinuities, and ineffective well completions. Solutions and corrective measures to be used are derived from a good geologic description that determines the quantity and distribution of net pay, volumetric original oil in place, and floodable volume at the injector-to-producer spacing. Techniques were developed to improve the calculations of original oil in place and to better determine the relationship between floodable volume and injection pattern. This relationship was the basis for major program changes. In carbonate reservoirs volumetric original oil in place may be larger than the calculated value because of discontinuities and ineffective well completions. If so, the ratio of material balance to volumetric original oil in place can be considered a measure of reservoir continuity and effective well completions. (Purdin-NWWA)

SUBSURFACE STRATIGRAPHY AND WATER RESOURCES OF CASS COUNTY, INDIANA,
Purdue University West Lafayette, Indiana. Department of Geosciences.
S. D. Noel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 847, Price codes: A08 in paper copy, A01 in microfiche. Purdue Univ. Water Resources Research Center Technical Report 102. June 1978. 94 p, 17 fig, 12 tab, 41 ref, 2 append, 1 plate. OWRT C-6106 No. 5213(5).

Descriptors: *Groundwater, *Glacial aquifers, *Water wells, *Stratigraphy, Groundwater availability, Groundwater recharge, Specific yield, Radioactive dating, Geologic formations, Bedrock, Cass County(Ind), *Indiana.

The groundwater resources of Cass County, Indiana are currently underdeveloped. The glacial outwash aquifers probably are capable of supplying large amounts of good quality water for industrial, agricultural, and urban needs and may do so if the future of the resources is properly developed and managed. Aquifers are classified by their occurrence in Wisconsinan and Illinoian deposits and in bedrock. Wisconsinan aquifers in gravel are interbedded with glacial till and are of limited areal extent. Production is sufficient only for domestic needs, but large quantities are available locally These Illinoian valley train deposits are potentially the most productive aquifers in the county. Bedrock aquifers may have relatively large production, but the depth to the aquifers and variability in yields have resulted in their use only where adequate supplies are not obtainable from shallower sources. Throughout the county, groundwater quality is good except for high iron content and hardness values. The hardness increases with depth probably reflecting the underlying carbonate bedrock. (Wiersma-Purdue)

THE BLIND ZONE IN SEISMIC GROUND-WATER EXPLORATION,
James Madison Univ., Harrisonburg, VA. Dept. of Geology.
J. E. Sander.
Ground Water, Vol. 16, No. 6, p 394-397, November-December 1978. 3 fig, 6 ref.

Descriptors: *Seismic studies, *Groundwater, *Exploration, Geophysics, Locating, Transmissivity, Aquifer characteristics, Velocity, Aquicludes, Resistivity, *Seismic refraction, *Blind zones, *Saturated thickness.

Seismic refraction methods can often indicate the saturated thickness of an aquifer. However, if an impermeable blind zone layer is present, it will not show up in the refraction profile. As a result, saturated thickness and transmissivity values indicated by the profile will be too high. Thus, it is important in many cases to look for a blind zone layer, and resistivity data combined with geological considerations are two possible ways of inferring its presence. (Visocky-ISWS)

TRANSIENT SPHERICAL FLOW TO A NON-PENETRATING WELL WITH CONSTANT DRAWDOWN,
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India). Dept. of Agricultural Engineering.
C. S. Jaiswal, and H. S. Chauhan
Ground Water, Vol. 16, No. 6, p 432-436, November-December 1978. 3 fig, 1 tab, 11 ref.

Descriptors: *Wells, *Water wells, *Drawdown, *Pumping, *Model studies, Mathematical models,

Aquifers, Theoretical analysis, Equations, Hydraulic conductivity, Impervious soils, Confined water, Groundwater, Groundwater movement, Observation wells, Hydrology, *Nonpenetrating wells.

Flow to a flowing nonpenetrating well in a leaky artesian aquifer was analyzed. A method was suggested to determine the aquifer parameters using the pump-test data on such wells with constant drawdown in the well. A technique also was suggested to determine the aquifer parameters using the well itself as the observation well. (Sims-ISWS)

THE IMPACT OF THE USE OF HEAT PUMPS ON GROUNDWATER TEMPERATURES,
Northern Cheyenne Research Project, Lame Deer, MT.
C. B. Andrews.
Ground Water, Vol. 16, No. 6, p 437-443, November-December 1978. 6 fig, 2 tab, 16 ref. EPA R803971020.

Descriptors: *Heat pumps, *Wisconsin, *Groundwater, *Water temperature, *Model studies, Mathematical models, Heat transfer, Heat flow, Temperature, Groundwater movement, Aquifers, Energy, Energy transfer, Hydraulic conductivity, Dispersion, Seasonal, Heating, Cooling, Hydrology, Groundwater heat pumps.

The impact of the use of a heat pump for residential heating and cooling on groundwater temperatures was simulated by means of a mathematical model which couples the equations for groundwater flow with those for heat transport. A hypothetical case using data typical for southern Wisconsin was considered. Water was pumped from a recharged to a sandstone aquifer using a two-well system. Water was withdrawn from a deep well and injected into a shallow well during the heating cycle, and during the cooling cycle the system was operated in reverse. After 10 years of operation, water temperatures in the aquifer had changed less than one degree centigrade at a distance of greater than 40 meters from the wells. For the case considered, the use of heat pumps for residential heating and cooling would not adversely lower groundwater temperatures if use were restricted to sparsely populated areas. It was recommended that statutes which prohibit the injection of water directly into the subsurface be changed to allow the use of groundwater heat pumps. (Sims-ISWS)

ROLE OF GROUND WATERS IN THE FORMATION OF THE TOTAL RUNOFF OF A SMALL DRAINAGE BASIN IN THE FOREST ZONE,
E. A. Zal'tsberg.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 61-63, 1977. 1 fig, 1 tab, 7 ref. Translated from News of the All-Union Geographic Society (Izvestiya VGO), Vol. 109, No. 1, p 85-90, 1977.

Descriptors: *Base flow, *Runoff, *Small watersheds, *Groundwater, Watersheds(Basins), Forest watersheds, Hydrology, Discharge(Water), Foreign countries, Foreign research, Subsurface waters, On-site investigations, Hydrogeology, Hydrologic cycle, Analytical techniques, Analysis, *USSR.

To study the groundwater regime and budget, the northwestern hydrogeological party of the Northwestern Geological Survey and the Valday Hydrologic Scientific Research Laboratory have organized obsevations at three gaging stations and at a single cluster of wells near Krestovaya village in the central part of a small (432 sq km) drainage basin. Each line consists of 2-4 wells 5-8 m deep. The lines of the gaging stations are perpendicular to the direction of groundwater flow. The depth to groundwater is 0-1.5 m in loams and 1.5-3.5 m in sands and loamy sands, as a rule. Because of the general characteristics of atmospheric circulation in the northwestern region, the annual groundwater level regime in the Polomet' River basin is distinctly seasonal with two maxima (spring and autumn) and two minima (pre-spring and summer-autumn) and corresponding rises in spring and autumn and drops in winter and summer. The groundwater runoff of the investigated basin in the upper course of the Polomet' River plays an important role in the formation of total river runoff in winter and summer, when its proportion may reach 60-100%. Its role is relatively small during the spring and autumn flood periods. The quantitative characteristics obtained can be used to describe the role of groundwater in the total runoff of other small rivers of the forest zone, the basins of which are under similar climatic, geological, and hydrogeological conditions. GROUND WATER...CALIFORNIA'S PRICELESS RESOURCE,
California Dept. of Water Resources, Sacramento.
R. S. Ford.
California Geology, Vol 31, No 2, p 27-32, Feb 1978. 7 fig, 4 ref.

Descriptors: *Groundwater, *Overdraft, *California, Groundwater mining, Hydrologic cycle, Water table, *Specific yield, Water storage, Water quality, Springs, Drilling, Rotary drilling, Data collections.

Although forty percent of California is composed of valley areas underlain with groundwater, those reserves are presently being over-exploited, with water tables falling as much as 10 m per year in some areas. To explain the problem to the general public, this author provides here a brief explanation and discussion of the geologic framework within which the State's groundwater is stored, characteristics of movement, physical properties, and methods of extraction, including definitions useful for the layman of (1) the hydrologic cycle (zone of groundwater, perched groundwater, sustained yield, storage capacity, and hydraulic flow), (2) quality, (3) springs, (4) water well construction, and (5) groundwater data. LAND SUBSIDENCE DUE TO WATER WITHDRAWAL IN THE VICINITY OF PECOS, TEXAS,
Cornell Univ., Ithaca, NY. Dept. of Engineering; and Cornell Univ., Ithaca, NY. Dept. of Applied Physics.
M. J. Rosepiler, and R. Reilinger.
Engineering Geology, Vol. 11, No. 4, p 295-304, Dec. 1977. 4 fig, 1 tab, 10 ref.

Descriptors: *Land subsidence, *Subsidence, *Groundwater mining, *Water table, Geomorphology, Hydrogeology, Geological surveys, Geophysics, Sedimentology.

Land subsidence due to groundwater withdrawal is an important problem detected in several areas of the U.S. A group of researchers at Cornell University have been working with the National Geodetic Survey to determine vertical movements of the earth's crust as indicated by comparison of precise leveling surveys. This study documents a previously unreported case of subsidence in the vicinity of Pecos, Texas, where a close correlation between water level decline and land subsidence indicates that compaction of the dewatered sediments is responsible for subsidence. A system of benchmarks throughout and beyond the Pecos area was established and two sets of relative elevations for the benchmarks along two lines crossing the area were supplied by the National Geodetic Survey. An area approximately 50 km long and 30 km wide was observed to have subsided a maximum of over 200 mm. between 1935 and 1956 Water table decline during the same period was as much as 60 m, a 1:180 ratio to ground subsidence. (Tickes-Arizona)

OWRT A-033-COLO(1). 14-34-0001-8006.

Descriptors: *Groundwater, *Surface-groundwater relationships, Regulations, Optimization, Algorithms, Model studies, *Conjunctive use, Computer models, Water levels, River forecasting, Low flow, Groundwater management, Conjunctive operation.

In most available computer models of stream-aquifer interaction, the river stages are treated as boundary conditions. However in reality for low flow conditions, the problem is the prediction of the river stages. In addition for management purposes it is essential to have explicit relations between the decision variables such as pumping rates or upstream flow releases and the resulting states of the system such as downstream river flows and aquifer drawdowns. By combining the discrete kernel approach for an isolated aquifer with the discrete kernel approach for an isolated river (treated as a cascade of Muskingum reaches) it was possible to derive the discrete kernels (influence coefficients) for all the states of interest as responses to all the relevant decision variables. The developed tool is well suited for management due to the explicit nature of the relations which make it possible to formulate the management (optimization) problem as a Mathematical Programming problem for which efficient solution algorithms exist.

WETLAND ROAD CROSSING: DRAINAGE PROBLEMS AND TIMBER DAMAGE,
Forest Service (USDA), St. Paul MN. North Central Forest Experiment Station.
J. H. Stoeckeler.
Research Note NC-27, April, 1967. 4 p, 2 fig, 3 tab.

Descriptors: *Wetlands, *Minnesota, *Roads, *Damages, Culverts, Road construction, Lumber, Flood damage, Conduits, Conveyance structures, Surface drainage, Wetland road crossing, Timber damage.

More than half the 70 wetland road crossings observed in a northeastern Minnesota survey showed timber killed or weakened by a rise in the water table caused by the damming effect of the road. Occurrence of damage was affected by the direction of the road in relation to the contours of the land. All of the 39 crossing that showed damage were within 45 degrees of being parallel to the contour. Nearly two-thirds of the crossings over peatland showed damage compared with about one-fifth of those over mineral soil. The chief drainage problems were absence of culverts or other corss drainage, culverts set too high, no collector ditch, no discharge ditch, inadequate collector or discharge ditches, and low culvert capacity. (California Water Resources Center Project UCAL-WRC-W-495). OWRT-B-175-CAL(4).

Descriptors: *Range management, *Erosion, Erosion control, *Environmental effects, *Land use, California, Sierra Nevada Foothills(Calif), Soil erosion, Sediments, Sedimentation.

The purpose of this investigation was to examine some range improvement practices commonly used in Sierra Nevada foothill beef cattle production. These range improvement practices can have both beneficial (food production, reduced fuel/fire danger, etc.) and adverse effects on the environment. Where adverse, measures are proposed to minimize this potential, e.g., leaving strips of trees to preserve relic habitat and to increase soil stability on a slope. Soil erosion was found to be the major category for prevention efforts, for it can be both a cause and effect of environmental degradation in rangeland. Causes of soil erosion vary from the land-clearing phase of vegetation-type conversion to overgrazing, and occasionally to access road construction. Soil erosion may result in sediment runoff to surface waters. This, in turn, may cause a detrimental impact on fishery and other beneficial uses of the waters if turbidity and dissolved oxygen depletion becomes harmful to the aquatic community. Other categories of impact include direct removal of wildlife habitat through vegetation-type conversion and indirect impacts on the cultural and biological resources. (Snyder-Calif, Davis)

Available from the Southern Forest Experiment Station. Proceedings: A Symposium on Principles of Maintaining Productivity on Prepared Sites, p 73-84. 1978. Mississippi State University, 3/21-22/78. Edited by Tom Tippin, Southern Forest Experiment Station. 48 ref.

Descriptors: Hydrologic properties, *Sediment control, *Microenvironment, *Soil erosion, *Soil physical properties, Harvesting, Forest management, Coastal plains, Federal Water Pollution Control Act, Water quality, Mississippi, *Forest practices, *Intensive site preparation, *Site productivity, Regeneration

In the past decade, traditional methods-of-cutting for natural regeneration of southern pine have been replaced by clearcutting, intensive site preparation, and planting. Although the practice is not new to the South, never before has it been so extensive or intense; nor has it caused so much public concern. If the exhortations of the South's Third Forest (Southern Forest Resource Analysis Committee 1969) are obeyed, 10 million acres of pine will have been reforested and 20 million acres of upland hardwood will have been converted to pine, mainly by clearcutting and planting, by the year 2000. The consequences of site disturbance due to forest activities are discussed in terms of alteration: in microclimate, water regime, hydrologic response, soil properties, soil movement, and sediment production. Also discussed are the relation to residual vegetation structure and implications for management. (Forest Service)

BROOK: A HYDROLOGIC SIMULATION MODEL FOR EASTERN FORESTS,
Forest Service (USDA), Durham, NH
C. A. Federer, and D. Lash.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 311, Price codes: A05 in paper copy, A01 in microfiche. Water Resource Research Center, University of New Hampshire, Durham. Research Report No 19, 1978. 84 p, 17 fig, 6 tab, 64 ref. OWRT A-999-NH(5).

Descriptors: *Model studies, *Water budgets, *Watersheds(Basins), *Forests, *Water yield, Hydrology, Evapotranspiration, Transpiration, Streamflow, Temperature, Evaporation, Forest watersheds, *Forest management, *Simulation analysis, New Hampshire, Hubbard Brook(NH), North Carolina, Coweeta Watershed(NC), Harvesting, Nutrient concentration modeling, Soil evaporation, Nutrient studies, Simulation model, Eastern forests.

A hydrlogic model called BROOK simulates water budgets for forest land in the eastern United States. BROOK is a water-yield model for small areas; it was not designed to simulate flood peaks or watersheds with multiple aspects. It operates with a daily time interval, and requires daily precipitation and daily mean temperature as input variables. BROOK can simulate hardwood, conifer, mixed, cleared, and regrowing vegetation types, but these types must be uniform over the watershed. Partial cuts cannot be simulated. Evaportranspiration is divided into five components and streamflow into three components. The model was calibrated and verified using experimental watersheds at the Hubbard Brook Experimental Forest in New Hampshire and the Coweeta Hydrologic Laboratory in North Carolina. BROOK was designed to study the response of streamflow on different slopes and aspects to cover changes caused by harvesting and regrowth or by conversion from hardwoods to conifers. It has also been used to examine streamflow resonse to different hardwood transpiration characteristics, to estimate soil-water deficits prior to floods, to stimate soil water available for tree growth, as a base for nutrient concentration modeling, and as a teaching tool.

5A. Identification Of Pollutants

A SURVEY OF PHOSPHORUS AND NITROGEN LEVELS IN TREATED MUNICIPAL WASTEWATER,
Corvallis Environmental Research Lab., OR.
J. H. Gakstatter, M. O. Allum, S. E. Dominguez, and M. R. Crouse.
Journal of the Water Pollution Control Federation, Vol. 50, No. 4, p 718-722, April 1978. 2 tab, 10 ref.

Descriptors: *National Eutrophication Survey, *Phosphorus, *Nitrogen, *Waste water treatment, *Municipal wastes, *Eutrophication, Sewage treatment, Sewage disposal, Effluents, Nutrients, Limiting factors, Phsophates, Regulation, Effluent limitations, United States, Activated sludge, Sewage lagoons, Waste water disposal.

During EPA's National Eutrophication Survey (begun in 1972), effluent samples from 809 municipal wastewater treatment plants in 47 states were analyzed for nitrite, nitrate, ammonia, dissolved orthophosphorus, total Kjeldahl nitrogen, total phosphorus, and total nitrogen. Median per-capita total phosphorus load from conventional waste treatment plants is 1.0 kg/yr, 74% immediately available for algal uptake, while mean total phosphorus export from agricultural land is about 30.8 kg/sq km/yr, of which only 43% is immediately available. Treated municipal wastewater from a city of 10,000 people could have the same impact as runoff from 560 sq km of agricultural land. Because they are controllable, point sources should be emphasized where excessive nutrients are a problem. Banning detergent phosphates can reduce municipal effluent phosphorus loads by about 50%, but there are few water bodies for which a detergent phosphate ban alone would provide adequate protection. Conventional treatment phosphate result in effluents with only 2-4 times as much nitrogen as phosphorus (optimum algal needs are 11-15:1), and receiving waters are often nitrogen limited; phosphorus is usually limiting in unimpacted waters. Typical median total phosphorus discharges from wastewater treatment plants are 6.1 mg/liter, and median total nitrogen discharges are 15 mg/liter (2.5 kg/capita/yr.). Median concentrations of both nutrients are significantly lower in activated sludge and stabilization pond effluents than in primary or trickling filter effluent. (Lynch-Wisconsin)

ATMOSPHERIC FORMATION, DISPERSION, AND DEPOSITION OF ACID SUBSTANCES,
Swedish Water and Air Pollution Research Lab., Goteborg.
C. Brosset.
Report B-444, June 1978. 14 p, 1 tab.

Descriptors: *Acids, *Atmosphere, *Air pollution effects, *Fallout, *Airborne transport, *Path of pollutants, Fossil fuels, Acidic water, Water pollution sources, Soil contamination, Dry fallout, Precipitation(Atmospheric), *Sweden, Sulfuric acid, Nitric acid, Sulfur, Nitrogen, Chemical reactions.

Important physical-chemical processes in the formation, transport, and deposition of atmospheric acid substances are described, primarily from data of Swedish stations. Quantification of deposition is not included. Acid substances are products which may form or contain acids, i.e., proton-donating chemical individuals. Most airborne sulfuric acid, HSO4 (-), and nitric acid is caused by fossil fuel combustion. In all combustion, nitrogen and oxygen in the air react in the high temperature zone, forming nitric oxide, and if the fuel is sulfurous, sulfur dioxide and trioxide are also formed. Sulfur trioxide is immediately converted under the influence of water and ammonia to slightly acid ammonium sulfate. Through photochemical reactions, nitric acid may be formed from nitric oxide and sulfuric acid from sulfur dioxide; catalytic processes may also be important in sulfuric acid formation. Acid substances formed may be introduced directly or indirectly to the recipient soil or lake as strong acids (sulfuric and nitric) or weak acids (HSO4(-) and ammonium); ammonium results from participation of ammonia in the atmospheric processes. Potential acidifying effect is associated with the concentration sum c sub H(+) + c sub HSO4(-). Most acidification is caused by (1) dry deposition of sulfur dioxide (and probably nitric acid), and (2) wet deposition of c sub H(+) and c sub HSO4(-). (Lynch-Wisconsin)

MEASUREMENT OF CHELATING AGENT LEVELS IN MEDIA WITH HIGH CONCENTRATIONS OF INTERFERING METAL IONS,
Missouri Univ.-Columbia. Dept. of Chemistry.
D. R. Jones, IV, and S. E. Manahan.
Analytical Letters, Vol. 8, No. 7, p 421-434, 1975. 1 fig, 4 tab, 7 ref. OWRT B-095-MO(3), 14-31-0001-4099.

Descriptors: *Chelation, *Chelating agents, Chelex, Analysis, Atomic absorption, EDTA, Copper, Metal ions, Measurement, *Pollutant identification, Cation exchange, *Water analysis.

A method is described for the measurement of strong heavy metal chelating agents in water based upon the solubilization of copper from a chelating cation exchanger followed by atomic absorption analysis of the solubilized copper. The copper concentration is thus equivalent to the concentration of chelating agent. A banded column is employed consisting of alternate layers of sodium-form Chelex and copper-form Chelex and copper form Chelex ion exchanger. The former serves to remove interfering ions which would displace copper whereas the copper-Chelex bands provide a sources of copper which is approximately 1 mg/l copper divalent chelating capacity, and equivalent ions can be tolerated in the sample up to approximately 1x10-2 M. Samples ranging in pH from 4 to 9 can be analyzed using this method.

ATOMIC ABSORPTION DETECTOR FOR CHROMIUM ORGANOMETALLIC COMPOUNDS SEPARATED BY HIGH SPEED LIQUID CHROMATOGRAPHY,
Missouri Univ.-Columbia. Dept. of Chemistry.
D. R. Jones, IV, and S. E. Manahan.
Analytical Letters, Vol 8, No 8, p 569-574, 1975, 5 ref. OWRT B-095-MO(4), 14-31-0001-4099.

Descriptors: *Organometallics, *Chromium compounds, *Atomic absorption, *Chromatography, *Pollutant identification, Organic compounds, Liquid chromatography, *Water analysis, Heavy metals.

Organometallic compounds are significant pollutants, therefore methods are needed for the analysis of specific compounds rather than total metal. This paper describes the use of high speed liquid chromatography (HSLC) interfaced with atomic absorption (AA) for the analysis of organometallics. The compounds are separated by HSLC and compounds of a specific metal measured by an AA instrument interfaced directly to the end of the HSLC column. Only compounds of the sought-for metal are observed, thus eliminating interferences and allowing for the use of relatively lower grade solvent for the mobile phase. Chromium acetylacetonate, tris (2' hydroxyacetophenono)chromium, and chromium hexafluoroacetylacetonate were separated using a mobile phase of 0.5% pyridine in toluene (v/v) and a Waters Associates Porasil A column. Three well defined peaks were obtained in less than 5 minutes at a flow rate of 2.5 ml/min. A detection limit of 40 nanograms in a 10 microliter sample was estimated. The basic approach should be applicable to the analysis of organometallic compounds in sediments and tissue.

INVESTIGATION OF MATRIX INTERFERENCES FOR AAS TRACE METAL ANALYSES OF SEDIMENTS,
Gulf South Research Inst., New Orleans, LA.
M. M. McKown, C. R. Tschrin, and P. P. F. Lee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-284 859, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA-600/7-78-085, May 1978. 137 p, 62 fig, 46 tab, 21 ref. R 804317-01.

Descriptors: *Spectrophotometry, *Soil analysis, *Trace elements, *Sedimentology, Flame photometry, Soil chemical properties, Soil analysis, Absorption, Costs, Acid mine water, Fallout, Powerplants, Mine drainage, Analytical techniques, Atomic absorption, Cobalt, Copper, Lead, Manganese, Nickel, Zinc, Barium, Calcium, Strontium, Vanadium.

Research was conducted to develop reliable, cost-effective methods utilizing flame atomic absorption spectrophotometry (AAS) for the trace elemental analysis of soil and sediment samples containing complex matrices. Samples of bottom sediment affected by acid mine drainage, and soil samples exposed to fallout from a coal-fired power plant were studied. The soil sample matrix consisted of more than 0.1% aluminum and iron; the sediment sample matrix contained more than 0.1% aluminum and iron, plus small quantities of calcium, magnesium, manganese, phosphate, and potassium. Conventional flame AAS produced accurate results for the analyses of cobalt, copper, lead, manganese, nickel and zinc in these matrices. Accurate determination of barium, calcium, strontium, and vanadium could not be made by the conventional AAS techniques. However, reliable results for these metals were obtained utilizing appropriate flame types with the addition of lanthanum and/or an easily ionizable alkali salt to all samples and standards. It is concluded that the procedures used in this research should be applicable to all environmental samples containing similar matrices, and that the adaptation of the AAS techniques to samples other than those examined is possible. Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 435, Price codes: A05 in paper copy, A01 in microfiche. Report Nos. EPA-600/7-78-122 and MLM-2425, June 1978. EPA-IAG-D6-0015.

Descriptors: *Water analysis, *Laboratory tests, *Plutonium, *Pollutant identification, Analytical techniques, Testing procedures, Water sampling, Quality control, Anion exchange, Evaluation, Hydrologic properties.

Results of a single-laboratory evaluation and an intelaboratory collaborative study of a method for detemining plutonium in water are presented. The method, written for analysis of one liter samples, consists of a coprecipitation, acid dissolution, anion exchange, electrodeposition and alpha pulse height analysis. After single-laboratory evaluation of the selected method, duplicates of four different samples were sent to laboratories participating in the collaborative study. The first two samples were river water, the third a substitute ocean water sample, and the fourth, a river sediment with deionized, distilled water added. All samples contained known concentrations of plutonium-239 and plutonium-238 with concentrations ranging from 0.42 to 28.9 dis/min/liter. Combined within-laboratory standard deviation of the results averaged 5.7%. Average plutonium recovery was 69%. (Davison-IPA)

MACROINVERTEBRATE SAMPLING TECHNIQUES FOR STREAMS IN SEMI-ARID REGIONS: COMPARISON OF THE SURBER METHOD AND A UNIT-EFFORT TRAVELING KICK METHOD,
Environmental Monitoring and Support Lab., Las Vegas, NV. Monitoring Systems Research and Development Div.
C. E. Hornig, and J. E. Pollard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 643, Price code: A03 in paper copy, A01 in microfiche Final Report No. EPA-600/4-78-040, July 1978. 28 p, 2 fig, 6 tab, 19 ref.

Descriptors: *Aquatic life, *Bioindicators, *Sampling, *Testing procedures, Macroinvertebrates, Benthic fauna, Stream, Net samplers, White River, Utah, Water analysis, Benthos, Bottom sampling, Arid climates, Semiarid climates.

Intensive macroinvertebrate sampling from a fauna-poor riffle on the White River, Utah, was conducted using two standardized techniques: a unit-effort traveling kick method, and a square foot Surber stream-bottom sampling method. The Surber method was of limited utility in the streams of the arid and semiarid regions of the Western U.S., due to the combined effects of faunal paucity and patchiness. Comparisons of 50 kick samples with 40 Surber samples revealed that kick samples provided more highly reproducible data than Surber samples in terms of counts of individuals and taxa, percentages of composition, and diversity indices. The reliability of the Surber sampler data was improved when visually richer sites were preselected. Differences in organism selectivity noted were that the Surber method attributed greater relative importance to the more closely adherent and cryptic forms, such as the simuliids, and the kick method was relatively biased toward easily dislodged oranisms such as baetid mayflies. It is recommended that the unit-effort traveling kick method be intensively tested for routine biological monitoring in larger fauna-poor western streams. (Davison-IPA)

MASS BALANCE DETERMINATIONS FOR POLLUTANTS IN URBAN REGIONS. METHODOLOGY WITH APPLICATIONS TO LEAD, ZINC, CADMIUM, AND ARSENIC.
California Inst. of Tech., Pasadena, CA. Dept. of Environmental Health Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 241, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA-600/4-78-046, August 1978. 124 p, 17 fig, 17 tab, 129 ref. 68-03-4034.

Descriptors: *Pollutant identification, *Water pollution sources, *Path of pollutants, *Mass, Lead, Zinc, Cadmium, Chemical analysis, Analytical techniques, Distribution patterns, Movement, Industrial wastes, Arsenic compounds, Trace elements, Particle size, Systems analysis.

The methodology developed for constructing mass balances for pollutants, which are interlinked in their movement through the air, land and water of an urban industrial area is reviewed. Results are reported for lead, zinc, cadmium, and arsenic, and the data is published in the open literature. The analysis is based on the principle of the conservation of mass for a given chemical element. Flow diagrams for each chemical element balance are used, which trace the movement of the pollutants through the immediate environment, and into adjoining areas. New data on the physical mechanisms of trace metal deposition has been acquired, and the method of predicting the far deposition of lead, zinc, and cadmium is described. (Davison-IPA)

PROCEDURE FOR THE EVALUATION OF ENVIRONMENTAL MONITORING LABORATORIES,
Tracer Jitco, Inc., Rockville, MD.
C. Bicking, S. Olin, and P. King
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 718, Price codes: A11 in paper copy, A01 in microfiche. Report No. EPA-600/4-78-017, March 1978. 224 p, 3 tab, 60 ref, 1 append. 68-03-2171.

Descriptors: *Laboratories, *Evaluation, *On-site investigations, Performance, Quality control, Laboratory equipment, Scientific personnel, Assessments, Inspection.

Procedures developed for use in evaluating laboratories engaged in measuring environmental pollution in the media of air, water, radiation and pesticides are presented. Laboratories are required to provide information on physical plant, equipment, personnel, quality control, and other aspects of laboratory performance on check list forms provided. On site inspection provides information on the less quantifiable laboratory aspects, and involves evaluation oriented to the specific methodology for which the laboratory is to be qualified. The scoring system is designed to be compatible with programs of proficiency testing, and is part of the total quality assurance program to objectively determine laboratory capability. This procedure is applicable to evaluation of laboratories of all sizes. (Davison-IPA)

REDOX POTENTIAL MEASUREMENTS AS AN INDICATION OF BIOCHEMICAL WELL PLUGGING.
Ground Water Associates, Inc., Arlington, MA
W. B. Armstrong.
Ground Water, Vol. 16, No. 6, p 446-447, November-December, 1977. 2 fig, 1 ref

Descriptors: *Clogging, *Chemical precipitation, *Iron bacteria, Water wells, Well efficiency, Well rehabilitation, *Oxidation-reduction potential.

The Vyredox Method removes iron and manganese from ground water by injection of oxygenated water into the ground around a supply well. This stimulates the activity of certain beneficial bacteria which precipitate iron and manganese. The precipitates are held in the aquifer with a resulting improvement in water quality and improved long-term well efficiency. Hydrogeologic and geochemical investigations were made at an existing municipal supply well in the town of Pembroke, Massachusetts, to determine the feasibility of using the Vyredox Method. The existence of an active iron and manganese precipitating bacteria colony in the productive zone of the aquifer was confirmed as responsible for rapid plugging of the well. (Purdin-NWWA)

INSTRUMENTS FOR MONITORING THE QUALITY OF NATURAL AND WASTE WATERS,
A. S. Yakunin, A. A. Kuz'min, and V. B. Belyakov.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 73-76, 1977. 5 fig. Translated from Hydraulic Engineering and Reclamation (Gidrotekhnika i melioratsiya), No. 1, p 111-115, 1977.

Descriptors: *Water quality, *Monitoring, *Instrumentation, Measurement, Dissolved oxygen, Biochemical oxygen demand, Water temperature, Foreign research, Waste water(Pollution), Natural streams, Polarographic analysis, Analytical techniques, Methodology, Chemical analysis, *USSR.

Instruments were described for automatically measuring dissolved oxygen, BOD, and oxygen consumption by waste waters. Block diagrams of equipment components and electronic circuits were given. After automatic measurement of dissolved oxygen by the polarographic method, the tested water sample can be used for further analysis. The portable analyzers for measuring the content of dissolved oxygen and its consumption rate and the equipment for the automatic determination of the BOD meet operating requirements in the laboratory and field and are relatively simple, compact, and easy to operate. The analyzers and their equipment can be used in scientific and industrial laboratories for the analysis of any liquid media. (Humphreys-ISWS)

DEVICE FOR MEASURING PH AND TEMPERATURE OF A LIQUID, WHICH INCLUDES A MEMORY,
Dow Chemical Co., Midland, MI. (Assignee).
J. V. Goode, Jr.
U.S. Patent No. 4,109,527, 8 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2079, August 29, 1978.

Descriptors: *Patents, *Water pollution control, Monitoring, Instrumentation, Thermal pollution, Water temperature, Hydrogen ion concentration, Electronic equipment, Data processing, Data transmission.

Disclosed is a portable electronic probe device, including a memory system, which is useful for measuring the pH and temperature of waste streams from chemical processes, to avoid thermal pollution and undesirable algae growth in rivers or ponds into which the waste is discharged. The pH sensor consists of a glass electrode-reference electrode combination. The temperature sensor is made up of a thermistor fitted into a well enclosure at the bottom of the probe. A display box attached to the probe contains a memory system. The pH and temperature value is received by the memory system as an electrical signal. The signals are amplified, converted from analog to digital data, and stored in a digital memory. The pH and temperature data, and the precise location at which the measurement is taken, appear continuously as digital displays in a transparent panel on the display box. When the memory is full the probe device is placed in a charger stand to re-charge a battery in the memory system by a magnetic 'coupling' sequence. At the same time, the data in the memory is clocked into a computer-recorder associated with the charger stand, using an optical 'blocking' technique. In this device the memory system can record and store pH and temperature data from up to 192 locations before it becomes full. (Sinha-OEIS)

CHEMICAL CHARACTERIZATION OF LOCAL AND STRATOSPHERIC PLUTONIUM IN OHIO SOILS,
Argonne National Lab., IL. Radiological and Environmental Research Div.
R. N. Muller.
Soil Science, Vol. 125, No. 3, p 131-136, March, 1978. 1 fig, 5 tab, 21 ref, 1 append.

Descriptors: *Isotope studies, Chemical analysis, Ecosystems, Industrial wastes, Soil contamination, *Ohio, *Plutonium, *Air pollution effects, Path of pollutants.

The chemical nature of plutonium derived from stratospheric fallout and industrial sources was studied in three agricultural soils. The majority of the soil plutonium was associated with a reductant-soluble, hydrous oxide phase that, under most conditions of terrestrial ecosystems, remains essentially immobile. The proportion of plutonium associated with organic matter (0.IN NaOH-extractable) varied among soils, and increased with decreasing particle size in the same soil. In a soil containing 238Pu from a local fabrication facility and 239,240Pu from stratospheric fallout, isotopic ratios between the NaOH-extractable and residual phases were essentially constant, indicating that, in these soils, plutonium from both sources behaves similarly. The distribution of soil plutonium with particle size appears to be most directly related to the mass of the soil particle. (Skogerboe-Colorado State)

CONSIDERATIONS IN CONDUCTING BIOASSAYS,
WAPORA, Inc., Charleston, IL. Bioassay Lab.
D. R. Rosenberger.
U.S. Army Engineer Waterways Experiment Station, Technical Report D-78-23, June 1978. 144 p, 7 tab, 842 ref.

Descriptors: *Bioassay, Freshwater fish, *Toxicity, *Pollutant identification, Water pollution effects, *Literature reviews, *Bibliographies.

A discussion of the bioassay principles and techniques in the literature are presented to provide a background for an understanding of aquatic bioassay testing. Aquatic bioassays often encounter complex toxicity problems. Two or more toxic compounds may be acting together or the toxicant concentration may fluctuate. Techniques in aquatic testing may vary depending on the type of toxicant tested and environmental parameters, such as temperature or dissolved oxygen, that need be controlled. Toxicant dosing equipment varies with the type of test species, source of water, and type of toxicant in question. The two most widely used delivery systems are the serial diluter and proportional diluter. Selection of bioassay test species warrants careful consideration. The criteria for selection of species cited by most authors include: type of test; economic importance; ecological significance; geographical distribution; ease of capturing, handling, holding, and culturing; availability and local abundance; toxicity responsiveness; consistency of response to toxicity; and reproductive success under assay conditions. The vast majority of species discussed in the bioassay literature are freshwater fish, primarily bluegill, rainbow trout, fathead minnow, goldfish, and largemouth bass. Recommended methods for capturing, handling, and maintaining many plants and animals for use in bioassays are presented. (WES)

ANALYSES OF PAPER MACHINE WATERS WITH ION SPECIFIC ELECTRODES. PART V. SULFIDE DETERMINATION USING AG(+) ION SPECIFIC ELECTRODE AND VARIOUS MEASUREMENT METHODS,
Valmet Oy, Jyvaskyla (Finland).
J. Korhonen, and P. O. Lumme.
Paperi ja Puu, Vol. 60, No. 5, p 373-379, May, 1978. 6 fig, 14 ref, 5 tab.

Descriptors: *Water analysis, *Sulfides, *Pulp wastes, Electrodes, Silver, Ions, Analytical techniques, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Microorganisms, Hydrogen sulfide, Volumetric analysis, Waste water(Pollution), Spectrophotometry, Storage, Waste storage, Calibrations, White water(Paper machines).

Water and white water circuits of two paper machines known to contain microorganisms that produced hydrogen sulfide were samples, and the samples were stored in air-free bottles and analyzed at weekly intervals, using different calibration and titration methods in conjunction with a silver electrode. Those calibration methods involving samples and calibration solutions prepared with NaOH solution containing ascorbic acid gave the best results across the entire concentration range. Titrations produced satisfactory results at high concentration. The spectrophotometric standard method was fairly accurate at low concentrations, but its negative error increased with increasing sulfide concentration. Compared to the calibration method, spectrophotometry was very laborious and gave low values at high sulfide concentrations. Iodometry was suitable mainly for analysis of highly concentrated sulfide solutions. (See also W78-09523; W74-11094; and W74-11093) (Brown-IPC)

EVALUATION OF SEMIPERMEABLE MEMBRANES FOR CONCENTRATION OR ORGANIC CONTAMINANTS IN DRINKING WATER,
Gulf South Research Inst., New Orleans, LA.
I. Cabasso, C. S. Eyer, E. Klein, and J. K. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-243 245, Price codes: A09 in paper copy, A01 in microfiche. Final Report No EPA-670/1-75-001, June 1975. 192 p, 35 fig, 16 tab, 43 ref, 3 append. 68-03-0126.

Descriptors: *Pollutant identification, *Semipermeable membranes, *Water analysis, *Analytical techniques, *Osmotic pressure, *Reverse osmosis, *Osmosis, Separation techniques, Evaluation, Solutes, Water pollution, Water quality, Potable water, Trace elements, Membrane processes.

A study was conducted to develop an analytically sound concentration method based on membrane separation techniques, for concentrating and recovering trace organic chemicals in potable water. The five membrane materials evaluated through experiment and through a review of the literature included cellulose acetate, cellulose acetate butyrate, ethyl cellulose, polyamide, and polyurea (NS-1). Osmotic concentration (OC) and reverse osmosis (RO) were the two methods used to evaluate the membrane materials. A complete description of

the OC apparatus is provided; RO data are taken from the literature, and description of an RO concentration scheme is included. Results of the study, combined with data from the literature, show: the feasibility of concentration and recovery of organic solutes by osmotic techniques, and that: (1) the degree of recovery of organic solutes varies with the particular solute-membrane combination; (2) a membrane's salt rejection is a good indicator of its mechanical integrity, but not its potential for concentrating organics; (3) solute recovery is influenced by the applied osmotic or hydraulic pressure; (4) the cellulose acetate-derived membranes serve as satisfactory first-separation membranes; (5) polyurea and polyamide are best suited for final concentration; (6) rejection expected from OC runs were higher for short concentration runs than RO; (7) RO processes handled large volumes of water easier than the OC process; and (8) very high osmotic pressure could be applied in OC procedures without altering membrane properties. (Davison-IPA)

QUANTITATIVE MAPPING BY REMOTE SENSING OF AN OCEAN ACID-WASTE DUMP,
National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
C. W. Ohlhorst.
Available from the National Technical Information Service, Springfield, VA 22161 as N78-33617 Price Codes : A03 in paper copy, A01 in microfiche. NASA Technical Paper 1275, October 1978. 26 p, 7 fig, 5 tab, 9 ref, 1 append.

Descriptors: *Waste identification, *Remote sensing, *Mapping, *Oceans, Analytical techniques, Acid wastes, Physical properties, Spectroscopy, Iron, Waste disposal, Industrial wastes, Organic wastes, Solid wastes, Sea water, Water pollution, Suspended solids, Waste dumps, On-site investigations, Inorganic compounds, Ocean dumping.

A remote sensing experiment was conducted at an ocean acid-waste dump site off the coast of Delaware to assess the possibility of relating remotely sensed spectral signatures to acid-waste concentrations. In situ water samples and measurements and concurrent remotely sensed data were obtained at the site. Results of the analysis for quantifying and mapping the acid-waste plume in terms of its particulate iron concentration and its suspended solids concentrations are presented. Total suspended solids, organic suspended solids, and inorganic suspended solids could not be accurately quantified and mapped with this data set. A linear least-squares-fit equation using the ratio of band 2 (440 to 490 nm) radiance to band 4 (540 to 580 nm) radiance was used to calculate iron concentration. The range of particulate iron concentrations in the plume ranged up to 1.1 mg/l at a depth of 0.46 m. A classification technique was developed to identify Sun-glitter affected pixels in the background-water data. (Davison-IPA)

COMPARISON OF METHODS FOR THE DETERMINATION OF TOTAL AVAILABLE RESIDUAL CHLORINE IN VARIOUS SAMPLE MATRICES,
Environmental Monitoring and Support Lab., Cincinnati, OH.
D. F. Bender.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 572, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/4-78-019, April 1978. 38 p, 1 fig, 15 tab, 15 ref.

Descriptors: *Pollutant identification, *Water analysis, *Chlorine, *Laboratory tests, Calcium compounds, Water treatment, Waste water, Effluents, Sewage, Potable water, Iodide reagents, River water, Distilled water, Chlorination, Oxidation, Testing procedures, Quality control, Water sampling.

Ten total available residual chlorine procedures were investigated to determine which procedure is most appropriate for particular sample matrices. All of the methods involve the same basic reaction: the oxidation of iodide reagents to iodine in a solution buffered at pH4. Data is provided concerning the precision, accuracy, and range, as well as the general advantages, and problems likely to be encountered in applying the methods to actual samples. Samples selected for study included distilled water, tap water, river water, a sewage plant effluent, and raw sewage; only the tap water did not require the addition of chlorine. Each of the methods worked well with certain matrices, but not in others, indicating the importance of the nature of the sample matrix. The data are tabulated, and a schematic representation shows the relative accuracy of the methods. (Davison-IPA)

INVESTIGATION OF THE MICROFLORA OF SWAMP ORE AND LAKE WATER BY THE METHOD OF ELECTRON MICROSCOPY, (IN GERMAN),
V. G. Dubinina, and Z. Derjugina.
Archiv Hydrogiologie, Vol. 71(1), p 90-102. November, 1977. 22 fig, 1 tab, 20 ref.

Descriptors: *Swamps, *Electron microscopy, *Iron bacteria, Wetlands, Bacteria, Microorganisms, Microscopy, Lakes, *Pollutant identification.

Electron and optical microscopy were used to investigate samples of swamp ore from two types of swamps and lacustrine freshwater. By means of electron microscopy a large number of small forms of iron bacteria and a number of interesting forms of microorganisms were revealed and some morphological details were clarified. In acidic swamps of pH 2.8-3.5, iron hydroxides have amorphous structure and the microflora was monotous. The microflora of samples of water and ores studied appeared to be more diversified and rich than had been previously assumed. (Steiner-mass)

A STATISTICAL EVALUATION OF SOME COLUMBIA RIVER BASALT CHEMICAL ANALYSIS,
Atomics International Div., Richland, WA. Rockwell Hanford Operations.
F. Asare, H. V. Michel, and C. W. Myers.
Available from the National Technical Information Service, Springfield, VA 22161 as RHO-BWI-ST-3, Price codes: A02 in paper copy, A01 in microfiche. Report No RHO-BWI-ST-3, May 1978. 62 p, 13 fig, 7 tab, 7 ref. EY-77-C-06-1030.

Descriptors: *Chemical analysis, *Analytical techniques, *Atomic absorption, *Statistical methods, *Radioactive waste disposal, *Basalts, *Columbia River Basin, Correlation analysis, Geological units, Geologic formations, Stratigraphy, Geologic investigations, Soil chemistry, Neutron activation analysis.

A statistical evaluation of the chemical data of the basalt layers of the Columbia River Basalt Group to determine their usefulness for identifying and correlating basalt units is presented. Examination of the atomic absorption data indicates that the oxides were measured with precision better than 4%; neutron activation analysis was measured with a precision better than 6%. The most important elements for basalt characterization can be ranked in descending order: (1) chromium and iron; (2) scandium, europium, potassium, magnesium, and titanium; and (3) barium, calcium, cobalt, aluminum, and sodium. Samples from Core Holes DDH-1, DH-2, DDH-3, DH-4, and DH-5 were compared with the type locality reference groups to determine if correlations could be established statistically using the data. Overall, 90% of the basalt core samples in DDH-3, DH-4, and DH-5 down to the level of the Priest Rapids IV could be statistically correlated; the correlations were unambiguous for many. Below the Priest Rapids IV level, statistical correlations of the basalts were more ambiguous due to the greater chemical similarity of these basalts. (Davison-IPA)

ASBESTOS IN THE WATER SUPPLIES OF THE TEN REGIONAL CITIES, PART I,
McCrone Research Inst., Chicago, IL.
I. M. Stewart.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 620, Price codes: A04 in paper copy, A01 in microfiche. Final Report No EPA-560/6-76-017, April 1976. 58 p, 1 fig, 14 tab, 12 append. 68-01-2690

Descriptors: *Pollutant identification, *Asbestos, *Water sampling, *Water pollution, Water analysis, Cities, Water supply, Surveys, Electron microscopy, Boston, New York City, Philadelphia, Atlanta, Chicago, Dallas, Kansas City, Denver, San Francisco, Seattle.

A nationwide survey was conducted to determine the impact of point and non-point sources on waterborne sources of asbestos. Both natural sites, in which asbestos bearing rocks are prevalent, and man-made sources were covered by the survey. As part of this program, an analysis was made of raw and finished water from the ten major cities housing regional headquarters of the Environmental Protection Agency: Boston, New York, Philadelphia, Atlanta, Chicago, Dallas, Kansas City, Denver, San Francisco, and Seattle. Results show essentially no asbestos fibers in New York, Chicago, Dallas, Kansas City and Denver. Asbestiform fibers were detected in Boston, Philadelphia, Atlanta and Seattle and the potential exists for asbestos contamination in the water supply of San Francisco. Asbestos content was determined by a transmission electron microscopic method. Samples of the water vacuum filtered through 47 mm diameter, 0.45 micrometer pore-size membrane filters that were then prepared for examination on the transmission electron microscope by a direct transfer method. (Gibson-IPA)

DETERMINATION OF METHYLMERCURY IN FISH OF SOUTH CAROLINA,
South Carolina State Coll., Orangeburg. Dept. of Natural Sciences.
A. K. Koli, and W. T. Canty.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 537-543, 1978. 3 fig, 1 tab, 6 ref.

Descriptors: *Mercury, *Brown trout, Food chains, Heavy metals, Path of pollutants, Water pollution effects, Gas chromatography, Analytical techniques, Chemical analysis, Fish physiology, Animal metabolism, Methodology, *South Carolina, Pollutant identification, Tissue analysis, *Bioaccumulation, *Methylmercury, Monomethyl-mercury, Dimethyl mercury

Brown trout were analyzed for methylmercury using gas chromatography. Definite evidence that the fish contained monomethyl and dimethyl mercury was presented. Data on the specific laboratory techniques involved in extraction were included. The fate of mercury in the marine environment was also discussed. (EIS-Deal)
W79-02478

ETHYLMERCURY: FORMATION IN PLANT TISSUES AND RELATION TO METHYLMERCURY FORMATION,
Environmental Monitoring and Support Lab., Las Vegas, NV.
L. C. Fortmann, D. D. Gay, and K. O. Wirtz
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 093, Price codes: A02 in paper copy, A01 in microfiche Ecological Research Series. Report EPA 600/3-70-037, April 1978. 7 p, 2 tab, 2 fig, 8 ref

Descriptors: *Mercury, *Metals, *Plant physiology, *Plant biochemistry, Air pollution, *Air pollution effects, Laboratory tests, Bioassay, Laboratory tests, Ethylmercury, Methylmercury, Trace elements, Elemental mercury vapor.

Seedlings of the common dwarf garden pea, Pisum sativum, cv. Little Marvel, exposed to elemental mercury vapor formed both methylmercury and ethylmercury in all parts of the plant. Concentrations of both organomercury compounds fluctuated considerably over a 48-hour exposure period, but the total of detectable forms of mercury continued to rise due to increased ethylmercury formation. Ethylmercury formation was greater in the light than in the dark, but methylmercury concentration did not differ significantly. The pattern of change in the concentrations of methtylmercury suggests both are metabolites of a single mercury pathway in peas. (EIS-Katz)

ESTIMATES OF 7-DAY, 10-YEAR MINIMUM FLOWS AT SELECTED STREAM SITES IN PUERTO RICO,
Geological Survey, San Juan, PR. Water Resources Div.
E. D. Cobb.
Open-file report 78-583, August 1978. 47 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Streamflow, *Low flow, *Low-flow frequency, *Waste assimilative capacity, *Puerto Rico, Streams, Analytical techniques, Data collections, Regression analysis.

The 7-day, 10-year minimum flow of streams is used as an index for determining the capacity of streams to receive waste effluents. This index of flow was computed from streamflow records for 31 stream sites in Puerto Rico. In addition, there was a need for the 7-day, 10-year minimum flow at an additional 15 stream sites for which adequate streamflow data were not available. The flow index was estimated at these sites on the basis of available record, records at nearby sites, and comparisons with drainage areas. (Woodard-USGS)

Descriptors: *Water pollution sources, *Path of pollutants, *Florida, *Canals, Coliforms, Nutrients, Trace elements, Insecticides, Bottom sediments, Water analysis, Sampling, Sewage effluents, Storm runoff, Agricultural runoff, Broward County(VA), *Plantation Canal(VA).

Water quality in the Old Plantation Water Control District in Broward County, Florida has been affected by effluent from sewage-treatment plants, agriculture, and storm-water runoff. Effect of effluent from sewage-treatment plants on water quality was evident at 3 sites where concentrations of nutrients and bacteria in the Broward County canals exceeded State standards of 2,400 colonies per 100 milliliters for total coliform bacteria. At 2 of the 3 sites the fecal coliform/fecal streptococcus ratios indicated possible human contamination. The effect of agriculture on water quality was evident where relatively high levels of chlorinated hydrocarbon insecticides had concentrated in the bottom sediments, of the canals. For example, DDD reached levels of 330 micrograms per kilogram at one site. The effects of storm-water runoff on water quality were detected during the wet season when concentrations of several trace elements increased. For example, zinc averaged 30 micrograms per milliliter in the wet season compared with 20 micrograms per milliliter during the dry season. (Woodard-USGS)

VOLATILITY OF MERCURY FROM SOILS AMENDED WITH VARIOUS MERCURY COMPOUNDS,
Environmental Monitoring and Support Lab., Las Vegas, NV. Monitoring Systems Research and Development Div.
R. D. Rogers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 014, Price codes: A03 in paper copy, A01 in microfiche. Final Report No. EPA-600/3-78-046, April 1978. 16 p, 4 fig, 2 tab, 8 ref.

Descriptors: *Mercury compounds, *Mercury volatilization, *Soil investigations, *Mercury, Soil physical properties, Soil texture, Mercury, Volatility, Sands, Clay loam, Loam.

Five different mercury compounds were used with three types of soil in a study conducted to determine the rate of mercury volatilization from soils freshly amended with mercury. Each of the soils, sand, loam, and clay was amended with each of the water-soluble mercury compounds: mercuric nitrate, mercuric chloride, mercuric acetate, mercuric oxide, and mercuric sulfide. It was concluded that mercury was volatilized from all the soils, but this loss was dependent on the soil type, and the form of mercury used. The maximum loss occurred within one week of the amendment. Further work is needed to determine the mechanism causing the volatilization of mercury applied to soil. (Davison-IPA)

SOURCE ASSESSMENT: WATER POLLUTANTS FROM COAL STORAGE AREAS,
Monsanto Research Corp., Dayton, OH.
R. A. Wachter, and T. R. Blackwood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 420, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-004m, May 1978. 121 p, 10 fig, 55 tab, 69 ref, 4 append. 68-02-1874.

Descriptors: *Coal mine wastes, *Water pollution, *Effluents, *Drainage effects, Water quality, Soil chemical properties, Runoff, Storm runoff, Simulated rainfall, Leaching, Precipitation(Atmospheric), Waste water(Pollution), Water sampling, Hydrologic aspects, Organic matter, Inorganic compounds, Coal stockpiles.

Effluents, due to leaching and drainage during and after precipitation are emitted from coal stockpiles maintained outdoors at production and usage sites. Aquatic life forms are exposed to these effluents as the runoff flows into waterways. The effluent levels from these sources are quantified through examination of coals, newly mined and aged, from six coal regions of the U.S. A representative source is defined to help characterize the waste water level from coal storage areas. Coals from the various areas were subjected to a rainfall simulator, and grab samles of the waste water were taken to obtain effluent data. The samples were analyzed for organic and inorganic matter and water quality parameters. Hydrologic relationships were used to estimate the runoff concentrations. Water quality criteria concentrations are compared with these levels to estimate their potential environmental impact. Applicable and future control techniques are discussed along with the growth and nature of stockpile quantities retained at production and usage sites. (Davison-IPA)

STORM DERIVED LOSSES OF PHOSPHORUS AND THEIR SIGNIFICANCE TO ANNUAL PHOSPHORUS EXPORT FROM TWO NEW JERSEY WATERSHEDS,
Rutgers - The State Univ., New Brunswick. Dept. of Zoology.
V. H. Smith.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 734, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, Oct 1976. 109 p, 28 fig, 8 tab, 34 ref. OWRT A-047-NJ(3), 14-34-0001-7064.

Descriptors: Streams, *Storm runoff, *Phosphates, Eutrophication, Reservoirs, Nutrients, *Phosphorus, *Nutrient removal, *New Jersey, Watersheds(Basins), Watershed management, *Path of pollutants, Dissolved solids, *Spruce Run Creeks(NJ), *Mulhockaway Creek(NJ), Water pollution sources, Self purification.

Transport of total phosphorus, total dissolved phosphorus, and soluble reactive phosphorus was measured under steady-state base flow and storm flow conditions in Spruce Run and Mulhockaway Creeks which drain adjoining watersheds and are the major water source for Spruce Run Reservoir, New Jersey. Day-to-day variability was greater in Spruce Run than Mulhockaway Creek as was the mean TP concentration. Apparently the SRP fraction was responsible for the difference. Estimated 240 day base flow loss of TP from Spruce Run Creek watershed was from .10 to .14 kg/ha and from Mulhockaway Creek it was .06 to .09 kg/ha. Approximate estimates of 365-day TP loading to the reservoir ranged from 0.17 to 0.24 g/m2/yr which exceeds the 'dangerous' level. Storm derived phosphorus export from both watersheds varied with storm intensity. Mild storms contributed only 1 to 2% over the base flow load whereas more intense storms could have contributed 50% or more of an annual TP load. Most of the storm derived TP was in particulate form which originated either from resuspended and scoured stream bed sediments or as soil particles in runoff.

THE EFFECTS OF STORM EVENTS ON THE ANNUAL PHOSPHORUS TRANSPORT IN SIX-MILE RUN,
Rutgers - The State Univ., New Brunswick. Dept. of Zoology.
B. A. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 722, Price codes: A09 in paper copy, A01 in microfiche. Master of Science Thesis, May 1978. 177 p, 56 fig, 6 tab. OWRT A-047-NJ(4), 14-34-0001-7064.

Descriptors: Streams, *Storm runoff, *Phosphates, Eutrophication, Reservoirs, Nutrients, Nutrient removal, *New Jersey, *Path of pollutants, *Phosphorus, *Six-Mile Run(NJ), Dissolved solids, Water pollution effects.

The importance of storm events for calculating phosphorus loading was studied. Concentrations appeared to be unrelated to flow during low flows but showed a weak relationship during high flows, and there was no consistent diurnal fluctuation of the concentration. Weekly samples could depict the concentrations present in the stream for the previous week if no storm intervened. Large changes in concentration occurred during storm flows above 1,000 l/s. Dissolved fractions usually increased during peak flow but did not if the major rainfall was a distance upstream from the sampling site. Winter storms or melts behave similarly to rainstorms in regard to phosphorus concentration changes. Due to the high flows and increased concentrations during storms, the storms contributed close to 50% of the yearly phosphorus loading for this stream. Importantly, the total phosphorus loading could be predicted for a storm once the stream's characteristics were known. This would reduce the time-consuming process of collecting storm events. Therefore it is possible to calculate the steady-state and storm phosphorus loading for a stream once a few storms and steady-state are collected.

INTERTIDAL ENVIRONMENT OF NORTHERN DUBLIN BAY,
Trinity Coll., Dublin (Ireland). Dept. of Botany.
D. W. Jeffrey, P. H. Pitkin, and A. B. West.
Estuarine and Coastal Marine Science, Vol. 7, No. 2, p 163-171, August 1978. 3 fig, 4 tab, 19 ref.

Descriptors: *Intertidal areas, *Pollutants, *Sediments, *Estuarine environment, Bays, Organic matter, Surveys, On-site investigations, Sampling, Cores, Metals, Phosphorus, Lead, Zinc, Copper, Chemical analysis, Analysis, Analytical techniques, Nitrogen, Sodium, Silts, Sands, Gravel, Correlation analysis, Foreign research, *Ireland.

A detailed survey of 10 km of the intertidal zone of Northern Dublin Bay was carried out by core sampling. One hundred samples were examined for variables, including particle size, organic matter, total nitrogen, phosphorus and lead, copper, and zinc. Results were presented in terms of: (1) correlations between pairs of variables; (2) location of sampling station; and (3) using multivariate analysis to achieve simple site classification. It was concluded that two distinct levels of environmental quality occur, with critical levels of organic matter, phosphorus, and zinc in the more polluted. A reasonable background level for organic matter for sandy mud would be 2.5% ignition loss or approximately 450 ppm total N. It was deduced from the low correlation coefficients that phosphorus may be either originating from a different source or is concentrated by a different process to organic matter. The decline in phosphorus concentration follows a more regular course, which is not markedly altered by changes in sedimentation. Background phosphorus concentration might sensibly be set at between 150 and 200 ppm P. The close correlation of the highest zinc and phosphorus values suggest either a common origin or a coprecipitation, or possibly both. Suggested background levels of zinc are in the order of 50 ppm. Although variation in copper was observed, strongly associated with both zinc and organic matter, concentrations as determined generally do not rise above a reasonable background of between 15-20 ppm. (Humphreys-ISWS)

COMPUTATION OF THE CONCENTRATION OF SUBSTANCES IN RIVERS AND CANALS,
Yu. A. Ibad-Zade, S. G. Gurbanov, and S. G. Azimov.

The concentration of polluting substances was computed for stationary waste water releases. It was assumed that it depends on x and y and that the turbulent diffusion coefficients differ in these directions and have constant values. A mathematical model presented for computing pollutant concentrations was verified from four series of experiments on the Kura River (USSR). During the field investigations, the following parameters were taken at five fixed gaging stations: (1) the velocity distribution on three verticals, (2) cross sectional areas, (3) slope of the water surface, (4) discharge, and (5) water samples for determination of the concentration of pollutants and background concentrations. Theoretical data generally agreed satisfactorily with the experimental data. (Humphreys-ISWS)

THE DISTRIBUTION AND FORM OF PHOSPHORUS IN NORTH ATLANTIC OCEAN DEEP-SEA AND CONTINENTAL SLOPE SEDIMENTS,
Rosenstiel School of Marine and Atmospheric Science, Miami, FL
J. W. Morse, and N. Cook.
Limnology and Oceanography, Vol. 23, No. 4, p 825-830, July 1978. 5 fig, 2 tab, 8 ref. NSF OCE 74-02352 A04.

Descriptors: *Sediments, *Phosphorus, *Deep water, *Continental slope, *Sediment-water interfaces, Apatite, Calcium carbonate, Diagenesis, Continental shelf, Oceans, Atlantic Ocean, Cape Hatteras(NC), North Carolina, Iron, Manganese, Carbon, Cycling nutrients, Distribution, Phosphates.

The general distribution of different forms of phosphorus in continental slope (Cape Hatteras, North Carolina) and deep-sea (central North Atlantic Ocean) sediments was investigated, as well as the extent to which this distribution is related to such other sediment compounds as organic carbon, calcium carbonate, and trace metals. Knoweldge of the chemistry of phosphorus diagenesis in these sediments is important in understanding the overall oceanic phosphorus cycle, since such sediments represent major oceanic phosphorus sinks. Core samples showed that apatite-phosphorus is the most important phosphatic component, and its abundance closely follows that of calcium carbonate in deep-se sediments. Nonapatite inorganic phosphorus correlates closely with acid-leachable iron and manganese. Organic phosphorus was most significant in reducing continental slope sediments, which also contained the highest amounts of organic carbon. Concentrations of dissolved reactive phosphate are similar to those found in shallow water sediments of the same general type. The cores (up to three m long) were taken from deep-sea sediments and seven from the continental slope. Deep-sea sediments with calcium carbonate as the dominate solid component had lower and less-variable dissolved reactive phosphate concentrations than deep-sea sediments with low calcium carbonate content. A computer model was designed to simulate soil erosion by rain and runoff. The mathematical representation was derived from Meyer and Wischmeier (models of soil detachment by water) and

from Ishihara (model of runoff and surface flow). The model computes the amount of soil and nutrients removed from agricultural field surfaces by erosion in two stages: (1) discharge rate of water on the surface and upper layer of the soil, and (2) contribution of soil detachment and transport by rainfall and runoff to losses of phosphorus, nitrogen, and soil. Computation of surface runoff and subsurface flow in a porous layer is essential for calculating erosion by runoff. Several computer runs with changing parameters illustrated the sensitivity of the model to changes in soil properties and characteristics and rain patterns. The rainfall for one October 1976 day in Haifa, Israel was 59 mm. In a model simulation, doubling that rainfall to 118 mm per day raised the underground water level from 12 to 20 cm, producing theoretical saturation of the supper soil layer. A uniform rainfall results in delay of runoff and a decrease in erosion. Erosion is doubled with an increase in slope steepness from 10 to 30 degrees, lateral water flow increases and underground level decreases. A porous upper soil layer 30 cm deep does not reach saturation in 24 hrs. Decreasing porosity from 43% to 20% produces rapid saturation. An increase in sublayer hydraulic coefficient induces faster drainage and thus prevents saturation of the upper layer and runoff. (Lynch-Wisconsin)

COMPARISON OF THE PREDICTIVE ACCURACY OF MODELS OF URBAN FLOW AND WATER-QUALITY PROCESSES,
Geological Survey, Bay St. Louis, MS. Water Resources Div. and Geological Survey, Miami, FL. Water Resources Div.
M. E. Jennings, and H. C. Mattraw.
In: Proceedings of National Symposium on Urban Hydrology, Hydraulics, and Sediment Control, held at University of Kentucky, Lexington, Kentucky, July 26-29, 1976. 8 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Peak discharge, *Urban runoff, *Model studies, *Mathematical models, Evaluation, Urbanization, Water quality, Urban hydrology, Storm drains, Surface runoff, Flood frequency, Forecasting.

Peak flow comparisons were made on four small urban catchments ranging in size from 47.8 to 613 acres using three selected stormwater runoff models. Average errors varied from -5 percent to 21 percent for the models. Preliminary studies of pollutant accumulation in one basin indicated pollutant loads can be related to rainfall volume and antecedent dry days with an average correlation coefficient of about 0.70. The surcharging effect of storm drains is indicated in comparisons of peak-flow frequency for one of the catchments studied. (Woodard-USGS)

HYDROLOGY AND WATER BUDGETS OF CYPRESS DOMES,
Florida University, Gainesville, Department of Environmental Engineering Sciences and Center for Wetlands.
K. Heimburg.
In: Third Annual Report on Cypress Wetlands, Floirda University, Center for Wetlands, Gainesville, p 56-67, 1976. 6 fig, 2 tab.

Descriptors: *Swamps, *Waste water, *Hydrologic properties, Wetlands, Water properties, Diffusion, Water table, Topography.

Surface water in a cypress dome is closely coupled to groundwater in the underlying water table aquifer. Usually the domes are a high on the water table, and water spreads radially outward from them recharging the water table. Infiltration from the swamps is governed by the position of the table relative to the surface water, as water tables fall during a dry period, hydraulic gradients around the swamps steepen and infiltration rates increase. Once surface water has moved into the water table aquifer, it moves out of the area under the influene of regional groundwater gradients, is used by the vegetation in areas surrounding the swamps or percolates to deeper aquifers. Surface flow into specific domes is primarily dependent on topography, but no clear relationship between runoff and surface characteristics has been established. When considered for waste water loading, sites should be selected for high infiltration rates. High water tables anywhere near a swamp reduce infiltration; these are associated with hills and slopes, which also increase runoff into the swamps, so flat sites are desirable. Smaller swamps are preferable for the most infiltration from the minimum area of swamp, there is more perimeter per unit surface area for infiltration. (See also W79-02256) (Steiner-Mass)

DISSOLVED HYDROGEN SULFIDE IN SOIL WATER IN SAN FELASCO HAMMOCK AND DEERHAVEN CYPRESS DOME,
Florida Univ., Gainesville. Center for Wetlands.
L. A. Burns.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 780-802, 1976. 2 fig, 3 tab, 14 ref.

Descriptors: *Swamps, *Hydrogen sulfide, Wetlands, Florida, Sulfides, Sulfur compounds, Muck soil.

A sampling reconnaissance of a cypress dome receiving high sulfate waste water from the Deerhaven steam-electric generating plant, and of floodplain soils of Turkey Creek in Sanchez Prairie, was conducted to determine concentrations of hydrogen sulfide dissolved in the soil solution. Background determinations were made for both sulfate and sulfide concentrations at Blue Spring on the Sante Fe River, and in the watershed of Possum Branch, a tributary of Hogtown Creek. Concentrations of hydrogen sulfide of 8 to 12 ppm were found in the soil solution in the Deerhaven dome. Concentrations ranging from 0.09 ppm at the edge of the floodplain to 4.4 ppm in a 'dead-tree' area were found in the Sanchez Prairie area of San Felasco Hammock. In the Possum Branch floodplain, concentrations ranged from 0.09 ppm at the edge of the floodplain to 0.25 ppm near the center of the floodplain. Sulfide concentrations in the vegetated margin of the Blue Spring boil pool and run, and in the Sante Fe River floodplain, ranged from 0.30 to 0.50 ppm. A soft organic deposit along the run had 1.40-2.26 ppm sulfide. (See also W79-02256) (Steiner-Mass)

Descriptors: *Pulp wastes, *Turpentine, *Kraft mills, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Foreign countries, Waste water treatment, Gas chromatography, Water analysis, Organic compounds, Terpenes, Soviet Union(USSR), Kraft mills, Lake Baikal(USSR).

Terpene compounds discharged with purified effluents from the Baikal kraft mill (USSR) are oxidized in Lake Baikal more slowly than are terpenes under laboratory conditions simulating those of the lake. This indicates that turpentine components undergo modification during the effluent purification process (involving biochemical and chemical treatments, mechanical purification, and aeration). To study the nature of the modification, gas-liquid chromatographic analyses were conducted of turpentine formed during the kraft cooking process, of turpentine in the effluents at various stages of purification, and of terpene compounds in Lake Baikal. Terpene hydrocarbons predominated in the crude turpentine and in the unpurified effluent. A large amount of volatile terpenes (up to 94%) was found in purified effluent, while the amount of terpene hydrocarbons was low (about 6%). These volatile compounds were also found in the lake. A certain amount of oxygen-containing compounds was found in the purified effluent. (Stapinski-IPC)

Laboratory studies of the biochemical degradation of lignosulfonates (LS) isolated from spent sulfite liquor have shown that the process is slow; the LS concentration in natural water was reduced 30% in two weeks, and only 4-5% during the subsequent 25 days. Evidently, the degradation initially involves the low-molecular weight fraction, with the remaining high-molecular weight fractions quit resistant to microorganism attack. The degradation process decreased the dissolved oxygen content and pH of the water, and had a significant effect on the mineral nitrogen content in water; there was an initial increase in the ammonium and nitrite nitrogen contents followed by a reduction of the concentration of these compounds. Phenols, organic acids, and alcohols were formed during LS degradation. Analyses of river water near the discharge site of a pulp and paper mill showed that biochemical degradation of LS does take place, with the intensity of degradation higher in the bottom deposits (where LS accumulates) than in the body of water. PRECIPITATION AND RUNOFF WATER QUALITY FROM AN URBAN PARKING LOT AND IMPLICATIONS FOR TREE GROWTH,
Missouri Univ.-Columbia.
C. H. Pham, H. G. Halverson, and G. M. Heisler.
Department of Agriculture, Forest Service, Research Note NE-253, 6 p, 1978. 15 ref, 4 tab.

Descriptors: *Water quality, *Storm runoff, *Trees, *Precipitation(Atmospheric), *Paving, New Jersey, Runoff, Surface runoff, Water supply, Phosphorus compounds, Lead, Copper compounds, Drainage, Parking lots, Urban runoff.

The water quality of precipitation and runoff from a large parking lot in New Brunswick, New Jersey was studied during the early growing season, from March to June 1976. Precipitation and runoff from 10 storms were analyzed. The runoff was higher in all constituents considered except for P, Pb, and Cu. Compared with published values for natural waters, sewage effluent, and storm-water drainage from urban land, the parking lot runoff was not highly polluted. It appears that such runoff is a satisfactory source of water for urban trees. (Witt-IPC)

WATER-QUALITY MONITORING IN THE AMERICAN URBANIZING SOUTHWEST,
Metcalf and Eddy, Boston, MA.
B. P. Popkin.
Paper presented at International Symposium on Urban Stormwater Management, University of Kentucky, Lexington, July 24-27, 1978, 6 p. 4 tab, 36 ref.

Descriptors: *Water quality, *Monitoring, *Urban hydrology, *Southwest U.S., Baseline studies, Precipitation(Atmospheric), Water pollution, Land use, Soil water, Overland flow, Groundwater movement, Water sampling.

The principles of water quality monitoring required in the fast-growing American Southwest are predicated on the extensive hydrologic and environmental effects of urbanization. As reviewed here, hydrologic events are sporadic in this region, highly variable and ephemeral over changing watersheds, thus requiring that techniques be modified accordingly. Guidelines for monitoring atmospheric precipitation, overland flow, streamflow, point pollutant discharges, soil water, and groundwater are suggested in terms of station selection, sample stabilization, and monitoring problems and solutions. Objectives of monitoring and data evaluation are discussed. The unique problems of water quality monitoring in the arid southwest are solvable, although most solutions depend on creative and flexible planning, training, and communication. (Tickes-Arizona)

WATER QUALITY OF STREAMFLOW FROM FORESTED WATERSHEDS ON SEDIMENTARY SOILS,
Arizona Univ., Tucson. School of Renewable Natural Resources.
P. W. Gregory, and P. F. Ffolliott.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol. 6, Proceedings, 1976 Meetings of the Arizona Section American Water Res. Assn. and the Hydrology Section, Arizona Academy of Science, April 29-May 1, 1976, Tucson, Arizona. OWRT A-066-ARIZ(1), 14-34-0001-6003.

Descriptors: *Water quality, *Sedimentary soils, *Ponderosa pine forests, *Streamflow, *Arizona, *Forest watersheds, *Heber Watershed(Ariz).

To provide quantitative baseline information on water quality of streamflow from ponderosa pine watersheds on sedimentary soils, water samples were collected at the mouths of four watersheds at time of surface runoff and during extreme or unusual hydrological events. In each sample, calcium (Ca++), magnesium (Mg++) and sodium (Na+) were determined by using atomic absorption spectrophotometry; carbonate (CO=3) and bicarbonate (HCO-3) were measured by titrating with standard acid; fluoride (F-), sulfate (SO=4), 3 nitrate (NO-3), and chloride (Cl-) were determined by colorimetric methods using an Autoanalyzer; hydrogen ion concentration (pH) was measured by using a glass electrode; and suspended sediment concentrations were determined by filtration. The data obtained were compared with EPA water quality standards for aquatic life, irrigation, and public water supply. Although the EPA levels of acceptability have not been established for many of the chemical and physical water constituents, the parameters determined in this study, in general, fall within the EPA prescribed limits. (Hasbrouck-Ariz)

PROCEEDINGS OF A WORKSHOP ON THE EVALUATION OF MODELS USED FOR THE ENVIRONMENTAL ASSESSMENT OF RADIONUCLIDE RELEASES.
Oak Ridge National Lab., TN.
Available from the National Technical Information Service, Springfield, VA 22161 as CONF-770901, Price codes: A07 in paper copy, A01 in microfiche. Report No CONF-770901, April 1978. Workshop held in Gatlinburg, Tennessee, September 6-9, 1977. 131 p, 4 tab, 183 ref, 1 append.

Descriptors: *Mathematical models, *Radionuclides, *Path of pollutants, *Dosimetry, *Radioactivity effects, *Public health, Radioactive fallout, Food chains, Atmospheric pollution, Evaluation, Future planning, Gamma rays, Safety, Waste treatment, Nuclear wastes, Radioactive waste disposal, Water cycle, Lethal limit, Soil contamination, Conferences.

The workshop was held to evaluate the predictive capabilities of the various mathematical models used in radiological assessments. The five major tasks of the workshop were: (1) a critical review of current practices in the environmental assessment of routine accidental releases of radionuclides; (2) the determination of limitations associated with these methods; (3) the identification of critical parameters which may contribute to error in model results; (4) the recommendation of improvements and future research for parameter determination, model development and model validation; and (5) the recommendations of models and parameter values most suitable for future assessments of radioactive releases to the environment. The topics covered by the working sessions were: atmospheric transport; aquatic and food chain transport; terrestrial food chain transport; and internal and external dosimetry. Abstracts for three of the reports are included. (Davison-IPA)

Descriptors: *Viruses, *Percolating water, *Percolation, *Water pollution sources, *Soil contamination, *Path of pollutants, Virus transport, Model studies, Forecasting, Solid wastes, Waste water disposal, Waste disposal.

A theoretical model for predicting the breakthrough curve of viruses from solid beds is developed. This model includes the percolation of contaminated water through clean solid beds (saturation) and of uncontaminated water through contaminated beds (elution). This model involves the solution of the reaction kinetic form of the adsorption/ion exchange equations when the effects of external mass transfer are important. The principal variables are column volume, volumetric flow rate, fluid volume passing through the column, stoichiometric capacity of the column and particle size. The model has been used to predict the breakthrough curve of the virus T4 bacteriophage on activated carbon where the Langmuir adsorption of T4 bacteriophage on activated carbon was evaluated using literature data. The model predictions agree favorably with qualitative experimental observations reported in the literature for virus breakthrough from activated carbon columns where the variables studied included bed length, flow rate and particle size. Breakthrough curves were also predicted for the transport of f-2 bacteriophage through soil columns using rough estimates of adsorption isotherms from literature data. Although these breakthrough curves were much different from the activated carbon system, the model was also in qualitative agreement with reported experimental observations for these soil systems in both saturation and elution operations. POLLUTIONAL CHARACTERISTICS OF STORMWATER RUNOFF,
Colorado Univ., Boulder. Dept. of Civil, Environmental, and Architectural Engineering.
E. R. Bennett, and K. Linstedt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 309, Price codes: A11 in paper copy, A01 in microfiche Colorado Water Resources Research Institute, Colorado State University, Fort Collins, Completion Report No 84, September 1978. 207 p, 36 fig, 68 tab, 88 ref. OWRT A-028-COLO(4).

Descriptors: *Storm runoff, Water pollution sources, Colorado, *Waste characteristics, *Snowmelt runoff, Sampling, *Mass loadings(Wastes), Water pollution treatment, Waste water treatment, *Boulder(Colo).

The pollutional characteristics of stormwater runoff were evaluated by sampling stormsewer discharges at three locations. The study was made in Boulder, Colorado and the emphasis was placed on the characteristics of snowmelt runoff. The runoff from three types of land use areas were studied. The sampling locations included a stormsewer outfall for an urbanized residential area with a population density of 25 persons per acre (62 persons per hectare); the outfall of the storm-sewer serving a suburban area with a density of 12 persons per acre (30 persons per hectare) and the runoff from an uninhabited, unsewered mountain watershed. The results showed that pollution from snowmelt is released more slowly than from rain runoff to a receiving stream and therefore the maximum concentrations were lower than those for rainfall. The total mass loadings were slightly lower for snowmelt compared to rain runoff on the same area for the major pollutants, COD, total and suspended solids. The mass loadings were much lower in snowmelt for the nutrients, nitrogen and phosphorus. Preliminary treatment evaluations of stormwater runoff were made using the process of plain sedimentation, coagulation-sedimentation using lime, alum, and ferric chlorides and by sand filtration. Due to the colloidal nature of the organic matter in the stormwater, coagulation-sedimentation and filtration were effective treatment methods but plain sedimentation gave relatively poor results.

ORGANOCHLORINE AND MERCURY RESIDUES IN FISH FROM LAKE SIMCOE, ONTARIO 1970-76,
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
R. Frank, M. Van Hove Holdrinet, R. L. Desjardine, and D. P. Dodge.
Environmental Biology of Fishes, Vol. 3, No. 3, p 275-285, 1978. 4 tab, 1 fig, 13 ref.

Descriptors: *Polychlorinated biphenyls, *Mercury, *Pesticide residues, *Path of pollutants, *Chlorinated hydrocarbon pesticides, *Freshwater fish, Canada, DDT, DDE, Heptachlor, Insecticides, Fish eggs, Fish reproduction, Lipids, Perches, Food chains, Food webs, Trophic levels, Fish reproduction, Agricultural runoff, Salvelinus, *Lake Simcoe(Ontario), Perca, *HEOD.

Ten species of fish were collected between 1970 and 1976 from Lake Simcoe for organochlorine and mercury analysis. DDT residues significantly declined between 1970 and 1975-76 in all species except small Stizostedion vitreum vitreum and large Salvelinus namaycush. Eggs taken 1975-76 from small S. namaycush had DDT residues below the critical level reported for the production of viable offspring, but this was not so for large members. III OD residues between 1970 and 1975-76 significantly declined in five species and PCB residues declined in all species except the larger Perca flavescens. Chlordane and heptachlor-epoxide were identified in S. namaycush for the first time in 1975-76. Mercury residues showed no change between 1970 and 1975-76 in five species, it declined in two species and increased in small S. v. vitreum. Correlations existed between levels of organic contaminant and lipid content of fish especially in the immediate post period of their use. Where the increasing lipid content was associated with an increasing trophic level a prey-predator relationship existed for contaminant accumulations. However, where lipid contents were low, no correlation appeared to exist in the prey-predator. (EIS-Katz)

FURTHER DATA ON HEAVY METALS AND ORGANOCHLORINES IN MARINE MAMMALS FROM GERMAN COASTAL WATERS,
Bundesforschungsanstalt fuer Fischerei, Hamburg (West Germany). Isotopenlaboratorium.
U. Harms, H. E. Drescher, and E. Huschenbeth.
Berichte der Deutschen Wissenschaftlichen Kommission fur Meeresforschung, Vol 26, No 3-4, p 153-161, 1978. 2 tab, 3 fig, 26 ref.

Descriptors: *Heavy metals, Mammals, Aquatic animals, *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Organochlorines, Metals, Path of pollutants, DDT, Polychlorinated biphenyls, Food webs, Copper, Zinc, Cadmium, Lead, Mercury, Food chains, *Harbor seals, Phoca, *Baltic Sea, *Marine mammals.

Studies on heavy metals and organochlorines in harbour seals (Phoca vitulina) were continued and extended to other marine mammals, which were found off the German North Sea and Baltic coasts. The results are compared with contamination levels in fish which form the major food source of the marine mammals investigated. Concentrations of copper, zinc, cadmium and lead in muscle and liver tissues of fish did not differ significantly from corresponding organs of the marine mammals. However, considerably higher amounts of mercury were found in the liver of seals and whales than in fish. Higher mercury concentrations in seals are closely related to the age of the animals. The highest amount of 160 mg/kg (ppm) Hg was found in an adult seal. In contrast to fish a high percentage of total mercury occurs in the inorganic form in seal and whale liver. The degree of contamination with organochlorines (PSB and total DDT) in seals and whales studied so far is of the same order of magnitude. Maximum values in seal blubber amount to 27 mg/kg (ppm) for DDT and 564 mg/kg (ppm) for PCB (wet weight). A comparison of fish and marine mammals shows that the pesticide burden in the various tissues is in the first instance a reflection of their lipid content. Seals form an exception, as the DDT and PCB content is comparably lower in the brain than in the liver which contains less fat. This is probably due to a brain barrier against an accumulation of organochlorines. (EIS-Katz)

UPTAKE, RETENTION AND LOSS OF CADMIUM BY BROWN SHRIMP, (CRANGON CRANGON),
Bundesforschungsanstalt fuer Fischerei, Hamburg (West Germany). Inst. fuer Kuesten- und Binnenfischerei.
V. Dethlefsen.
Berichte dew Deutschen Wissenschaftlicher Kommission fur Meeresforchung, Vol 26, No 3-4, p 137-152, 1978. 11 fig, 8 tab, 32 ref.

Descriptors: *Shrimp, *Cadmium, *Absorption, *Path of pollutants, *Commercial shellfish, Crustaceans, Invertebrates, Laboratory tests, Metals, Animal physiology, Estuarine environment, Water pollution effects, Environmental effects, Crangon, *Bioaccumulation, *Depuration, *Brown shrimp.

Crangon crangon were exposed to Cd-concentrations of 5-100 microgr/l in static tests and 1,5-2,5 microgr/l in constant flow through tests. Loss and retention experiments were conducted after an uptake period of 20 days. A rapid shorttime accumulation characterized by the building of an early plateau was followed by a long term accumulation characterized by a linear increase of the total body load. For no concentration of Cd a final equilibrium between body load and water concentration was encountered, but in the 1,5 microgr Cd/l flow through experiment no uptake of Cd by C. crangon could be measured. Major sites of accumulation were gills and hepatopancreas, no significant uptake was found to take place in the abdominal muscle. Cd was incorporated into the exoskeleton. Retention of Cd was very effective after exposure to 5 microgr Cd/l for 20 days, no loss of Cd from the shrimps could be measured in a period of 7 days. Accumulation factors were identical to those calculated for C. crangon living in the Elbe estuary. (EIS-Katz)

THE POLLUTION OF SEA-WATER IN NAGASAKI BAY IN SUMMER 1976 AND 1977, (IN JAPANESE),
Nagasaki Univ. (Japan). Faculty of Fisheries.
S. Miyahare, and H. Ohno.
Bulletin of the Faculity of Fisheries, Nagasaki University, No. 45, p 29-31, 1978. 1 fig, 2 tab, 4 ref.

Descriptors: *Chemical oxygen demand, *Suspended solids, *Cadmium, *Lead, *Mercury, Organic compounds, Heavy metals, Sea water, Water quality, Water chemistry, Chemical analysis, Dissolved oxygen, Salinity, Water temperature, Hydrogen ion Concentration, *Arsenic, *Nagasaki Bay(Japan).

Following a previous report in 1975, we conducted an examination of the pollution of sea-water in Nagasaki Bay in summer 1976 and 1977 to check the environmental changes in the bay. Although chemical oxygen demand was inclined to decrease yearly, suspended solids increased considerably, probably because of the increased dust in the seawater. N-hexane extracts showed a trend of gradual increase. Cadmium and lead were detectd, though they were not detected in 1975. Mercury and arsenic decreased yearly during the period of this investigation. (EIS-Deal)

INSECTICIDE PERSISTENCE IN NATURAL SEAWATER AS AFFECTED BY SALINITY, TEMPERATURE, AND STERILITY,
Gulf Coast Research Lab., Ocean Springs, MS. Microbiology Section.
W. W. Walker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 605, Price codes: A02 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA 600/3-78-044 April 1978, 25 p, 8 tab, 4 fig, 23 ref.

Descriptors: *Insecticides, Pesticides, *Chlorinated hydrocarbon pesticides, Phosphothionate pesticides, Water temperature, Sea water, Salinity, Sterility, *Malathion, *Parathion, *Methylparathion, *Diazinon, *Methyloxychlor, Gas chromatography, Degradation, Decomposition, Microbial degradation.

The effect of temperature, salinity, and sterility on the degradation of malathion, parathion, methyl parathion, diazinon, and methoxychlor in fresh and estuarine water has been determined under controlled laboratory conditions. Surface water samples of 1, 10, 20, and 28 ppt salinity were amended with the above insecticides and incubated in the dark at 30, 20, and 10C under sterile and nonsterile conditions. Insecticide abatement was followed by electron-capture gas-liquid chromatographic techniques. No significant differences between sterile and nonsterile treatments were observed for any of the insecticides studies, while the effect of increas-

ing temperature was highly significant with regard to increased degradation of malathion, parathion, methyl parathion, and diazinon. Methoxychlor reflected the recalcitrance characteristic of the chlorinated hydrocarbon insecticides throughout 84 days of incubation and was not significantly affected by salinity, temperature, or sterility. Salinity effects were varied among the four organophosphates, being highly significant for malathion and diazinon, significant for methyl parathion, and not significant for parathion. (EIS-Katz)

5C. Effects Of Pollution

SIGNIFICANCE OF NITRIFICATION IN STREAM ANALYSIS-EFFECTS ON THE OXYGEN BALANCE,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
M. S. Finstein, P. F. Strom, and V. A. Matulewich.
Journal of the Water Pollution Control Federation, Vol. 50, No. 8, August 1978, p 2055-2057. 1 fig, 12 ref.

Descriptors: *Nitrification, Streams, *Dissolved oxygen, *Biochemical oxygen demand, *Mathematical models, *Nitrogen fixing bacteria, Nitrogen cycle, Model studies, Bacteria, Plankton, Benthos, Grand River(MI), Michigan, Passaic River(NJ), New Jersey, Nutrients, Waste water disposal, Waste water treatment.

A retrospective critique of Courchaine's 1968 paper on effects of nitrification in streams on oxygen balance contends that nonplanktonic nitrifying organisms associated with the streambed probably account for the high rate of nitrification observed just below the wastewater treatment outfall in the Grand River, Michigan. In the study, the course of nitrate accumulation in the river below the outfall did not resemble the course of nitrification-induced oxygen uptake during laboratory incubations. In the river, nitrate accumulation was underway 0.05 days downstream and two-thirds of the effluent nitrogenous load was accounted for in terms of nitrate at a point 0.73 days downstream. Location of nitrifying bacteria in the receiving stream determines the appropriate type of mathematical stream model. An autocatalytic model is suitable for streams with planktonic nitrifyers, where nitrification is delayed until the nitrifying population expands in response to ammonium enrichments. For nonplanktonic nitrifiers, a model based on zero-order kinetics is appropriate; in this case nitrification begins immediately below outfall. Courchaine's paper clearly demonstrates that nitrification can be an important mechanism in removal of DO from receiving streams. (Lynch-Wisconsin)

THE EFFECTS OF WEED-CUTTING ON THE MACRO-INVERTERATE FAUNA OF A CANALISED SECTION OF THE RIVER HULL, A NORTHERN ENGLISH CHALK STREAM,
James Cook Univ. of North Queensland, Townville (Australia). Dept. of Zoology.
R. G. Pearson, and N. V. Jones.
Journal of Environmental Management, Vol. 7, No. 1, p 91-97, July, 1978. 4 tab, 8 ref.

Descriptors: *Environmental effects, *River Hull(England), *Mechanical control, *Aquatic weed control, *Invertebrates, *Aquatic animals, Chalk streams, England, Rivers, Canals, Drainage, Insects, Summer, Faunal lists, Ranunculus fluitans, Potamogeton, Cladophorea, Fish, Benthic fauna.

Cutting and removal of large amounts of vegetation and its associated invertebrate fauna from the River Hull, a chalk stream in northern England, resulted in: (1) removal of significant numbers of animals in the weeds, (2) an increase in activity of many benthic faunal species, and (3) increased drifting of some plant-dwelling animals. The increase in activity was probably due to both general habitat disturbance and influx to the bottom populations of animals escaping from the cut weed. Long-term effects are considered to be minimal, though effects could vary with the timing of cutting, and fish populations could be adversely affected by weed cutting. The operation referred to the great ability of stream communities to recover from disturbance. In the section of the canalized river investigated, the river had an approximate width of 20 m, a depth of 0.5-1.5 m, and current velocity of 10-20 cm/sec, and a substream of coarse sand and silt. A list of 26 taxa of fauna found on Ranunculus fluitans, Potamogeton spp, Cladophora sp., and several drifting plant species is given. Other common plant species include Ranunculus aquatilis, Fontinalis antipyretica, Oenanthe fluviatilis, Groenlandia densa, Ceratophyllum demersum, and Hippuris vulgaris. (Lynch-Wisconsin)

AMMONIUM OXIDATION AND ITS SIGNIFICANCE IN THE SUMMER CYCLING OF NITROGEN IN OXYGEN DEPLETED SKAN BAY, UNALASKA ISLANDA, ALASKA,
Tokyo Univ. (Japan). Ocean Research Inst.
A. Hattori, J. J. Goering, and D. B. Boisseau
Marine Sciences Communications, Vol. 4, No. 2, p 139-151, 1978. 3 fig, 2 tab, 8 ref. NSF GA-37963.

Descriptors: *Skan Bay(AK), *Ammonium, *Oxidation, *Oxygen depletion, *Nitrogen, *Anaerobic conditions, Alaska, Denitrification, Bays, Cycling nutrients, Nitrites, Nitrates, Nutrients, Phytoplankton, Algae, Pycnocline, Biochemical oxygen demand, Bacteria.

A study in Skan Bay (Unalaska Island, Alaska) August 1972 showed that ammonium oxidation proceeds in the entire water column, including in the oxygen-depleted waters below 35 m. The daly amminium oxidation rate in the stagnant water below 35 m was estimated at 150 mg N/sq m/day from decreases in ammonium and 100 mg N/sq m/day from increases in nitrite and nitrate. Observations suggest the nitrite was produced by bacterial oxidation of ammonium, and the decrease in nitrate near the bottom shows sediments act as a nitrate sink in the summer. Nitrate was reduced to nitrite and ammonium in the near-bottom water, but at a less intensive rate than the ammonium oxidation. Four-day bottle incubation and tracer experiments using nitrogen-15 ammonium yielded results consistent with rates of ammonium oxidation estimated from 18-day observations of water column concentration changes. Rates of oxidation below 35 m were comparable to production of organic nitrogen by phytoplankton in the euphotic zone. A shallow sill at 10 m depth at the mouth of the bay's western arm retards water exchange between the inner and outer bay; maximum depth of the inner bay is 63 m. During summer a seasonal pycnocline at 25 m prevents vertical convention; water below 35 m is thereby effectively isolated. By late September near-bottom water is depleted of oxygen by biochemical oxygen utilization, and anoxic bacteria flourish which use nitrate and sulfate in respiration. (Lynch-Wisconsin)

EFFECTS OF FOREST WORKINGS ON STREAMFLOW AND WATER QUALITY (PART I),
Forestry and Forest Products Research Inst., Tokyo (Japan). Div. of Forest Influences.
N. Nakano.
Japan Agricultural Research Quarterly, Vol. 11, No. 4, p 246-253, October 1977. 7 fig, 1 tab, 4 ref.

Descriptors: *Forest watersheds, *Forest management, *Lumbering, *Environmenta effects, *Japan, *Streamflow, *Water pollution sources, Streams, Forests, Recreation, History, Evapotranspiration, Clear cutting, Infiltration, Interception loss, Precipitation, Runoff.

Major results of forest hydrological experiments conducted since 1935 at Japan's Forestry and Forest Products Research Institute are outlined. Streamflow and water quality are affected by activities as forest planting, herbicide spraying, fertilization, road building, recreation, and most importantly, logging. Recreation is likely to cause the major future problems. Two types of experiments are reported: (1) hydrological functioning of forests (interception loss, evapotranspiration, and infiltration capacity of forest land), and (2) effects of forest use on runoff (effects of clear cutting on water yield, high streamflow, and low streamflow; reasons for changes in high streamflow after cutting; and the relationship between forest vegetation and high and low streamflow). Interception loss varied with forest type, precipitation, and other climatic conditions, and for a coniferous forest canopy loss was 15-20% annual net precipitation, under-growth loss was about 1 mm/storm, and liter loss was 2-4 mm. Evapotranspiration accounted for mean annual water loss of 400-1100 mm for 6.6-645 ha mixed forest watersheds. Clear cutting and logging increased annual runoff and its percentage of annual precipitation; runoff increases ranged 10-45%. Quickflow increased after cutting, due in part to increased surface runoff resulting from compaction by logging. Low streamflow increases are probably due to diminished transpiration after cutting. (Lynch-Wisconsin)

A DYNAMIC LAKE MODEL FOR TROPHIC STATE PREDICTION,
Eidgenoessische Anstalt fuer Waserversorgung, Abwasserrinigung und Gewaesserschutz, Zurich (Switzerland).
D. M. Imboden, and R. Gachter.
Ecological Modelling, Vol. 4, No. 2-3, 77-98, 1978. 9 fig, 5 tab, 16 ref.

Descriptors: *Trophic level, *Lakes, *Mathematical models, *Primary productivity, *Phosphrous, *Eutrophication, *Simulation analysis, Lake restoration, Forecasting, Dynamic models, Phosphates, Nutrients, Algae, Phytoplankton, Switzerland, Washington, Lake Washington(WA), Alpnachersee(Switzerland), Greifensee(Switzerland), Time, Depth, Aeration, Destratification, Hydraulic residence time, Diversion, Water pollution effects, Diffusion.

A dynamic, one-dimensional vertical model for phosphate and particulate phosphrous simulates the relationship between phosphrous loading and primary production per unit lake area, as a measure of a lake's trophic state. Primary production per unit lake area is described by a nonlinear function of phosphate and particulate phosphorus which accounts for Michaelis-Menten saturation and algal self-shading. The model includes lake morphometry, hydraulic loading, respiration rate, sedimentation, vertical eddy diffusion, thermocline depth, and phosphorus exchange at the sediment-water interface. The model was applied to Alpnachersee and Greifensee in Switzerland and Lake Washington in Washington state, and good agreement was found between observation and the calculation of phosphorus variations as a function of time and depth. The calibrated model predicted the effectiveness of various eutrophication control measures, such as reduction of phosphrous loading, discharge of hypolimnetic water, hypolimnion aeration, and destratification. For Greifensee, with a mean residence time of 1.2 years, reduction in phosphorus loading to 20% current level is needed to achieve permanent aerobic conditions throughout the lake; other measures result in only minor improvements. The model simulates well the observed recovery of Lake Washington following sewage diversion 1963-67. (Lynch-Wisconsin)

EXAMINATION OF A LAKE MODEL,
Royal Danish School of Pharmacy, Copenhagen.
S. E. Jorgensen, H. Mejer, and M. Friis.
Ecological Modelling, Vol. 4, No. 2-3, p 253-278, 1978. 11 fig, 12 tab, 23 ref.

Descriptors: *Eutrophication, *Mathematical models, *Lyngby Lake(Denmark), *Glumso Lake(Denmark), *Simulation analysis, *Lakes, Model studies, Computer programs, Denmark, Nutrients, Parameters, Waste water disposal, Water pollution effects, Dynamic models, Phosphorus, Nitrogen, Organic matter, Forcing functions, Environmental effects, Ecosystems, Equations.

A eutrophication model previously described and calibrated is further validated and recalibrated with data from Lyngby and Glumso Lakes, Denmark. Glumso Lake was used in the original study, and the present paper makes use of an additional year of data from that lake. Lyngby Lake received treated wastewater 1952-58, which contained a high nutrient concentration. The model was used to simulate changes in Lyngby Lake 1959-75 following diversion of the wastewater to the sea in 1959. The model closely describes the lake's response, and generally appears to accurately represent long-term changes and changes in average and maximum values caused by alterations in forcing functions. The model needs to be improved for use in describing annual cycles, but can be used for setting up environmental impact statements. Some aspects of the model were modified to permit investigation of effects of applying submodels which better describe actual ecosystem processes. Sensitivity analysis of one modification was carried out to estimate the importance of parameters, and results were used to calibrate the model more systematically. An automatic computer calibration was tested on four versions of the model, and a subsequent validation was compared with each version. An itemized list is given of state variables, differential equations, rates, limiting factors, other equations, parameter values, and forcing functions of model II. (Lynch-Wisconsin)

A SIMULATION MODEL FOR PHYTOPLANKTON GROWTH AND NUTRIENT CYCLING IN EUTROPHIC, SHALLOW LAKES,
N. Nyholm.
Ecological Modelling, Vol. 4, No. 2-3, p 279-310, 1978. 5 fig, 7 tab, 30 ref.

Descriptors: *Lakes, *Phytoplankton, *Mathematica models, *Cycling nutrients, *Eutrophication, *Simulation analysis, *Water management(Applied), Denmark, Shallow water, Model studies, Phosphorus, Nitrogen, Algae, Plant growth, Nutrients, Dynamic models, Guden River Basin(Denmark), Funen Island(Denmark), Limiting factors, Seasonal, Forecasting, Primary productivity, Sewage disposal, Retention time.

A dynamic model which simulates phytoplankton growth and phosphorus and nitrogen cycling in shallow eutrophic lakes give reasonably good results, at least for lakes with short hydraulic retention times. The model is intended only to describe average conditions over a time scale of several days. It describes a seasonal cycle in a lake assumed to be in equilibrium regarding nutrient inputs for one year and predicts future equilibrium for effects of altered inputs. The model is relatively simple and data requirements are fairly modest; it is designed primarily for practical application, and may be used for environmental management. It has been used to simulate 12 Danish lakes, seven on the island of Funen and five in the Guden River basin. Two of the latter were subdivided, Lake Silkeborg Langsoe into three boxes and Lake Tange into two. Most parameter values were common to all simulations, while a few key parameters were allowed to vary somewhat. Where larger deviations were necessary, reasonable explanations could usually be given. Parameter values and selected numerica results (such as primary productivity) are given for all simulations performed. Simulations of Lakes Braendegaard, Noerre, and Arreskov were unsatisfactory because it was forseen that nitrogen would become a growth-limiting factor. (Lynch-Wisconsin)

ORGANISM PATCHINESS IN LAKES RESULTING FROM THE INTERACTION BETWEEN THE INTERNAL SEICHE AND PLANKTONIC DIURNAL VERTICAL MIGRATION,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
D. Kamykowski.
Ecological Modelling, Vol. 4, No. 2-3, p 197-210, 1978. 7 fig, 15 ref.

Descriptors: *Vertical migration, *Seiches, *Plankton, *Diel migration, *Lakes, *Computer models, Patchiness, Distribution, Zooplankton, Phytoplankton, Equations, Model studies, Computer programs, Windemere(England), England, Stratification, Winds, Predation, Pycnocline, Algae.

Computer models tested Colebrook's conclusion (in a 1960 study of the Windemere, England internal seiche) that wind and the internal seiche combined with diurnal vertical migration of plankton through the thermocline should have a permanent effect on the horizontal distribution of organisms. The observed temporal and spatial patchiness of organisms is influenced by : (1) sampling interval, (2) frictional damping of the basin, (3) phase angle between the seiche and the daylight cycle of vertical migration, (4) organism behavior patterns, and (5) organism swimming speed. Migrating organisms that exclusively reside in either the epilimnion or hypolimnion are affected by currents in the respective layers; the resulting horizontal patchiness is temporary since these organisms maintain a continuous relationship with the same water column. Organisms that cross between layers during their diurnal vertical migration change water columns with each transit and thus can form permanent patches. In Windemere these permanent patches daily vary in strength depending on the current exposure experienced by organisms capable of various swimming speeds. Predator-prey encounters between phytoplankters swimming at 1.5 m/hr and zooplankters swimming at 4 m/hr were investigated. These migration interactions may have an important effect on growth and survival of phytoplankton or zooplankton populations. (Lynch-Wisconsin)

EFFECTS OF NITRATE CONCENTRATION ON THE GROWTH AND PHYSIOLOGY OF LOMINARIA SACCHARINA (PHAEOPHYTA) IN CULTURE,
Dalhousie Univ., Halifax (Nova Soctia). Dept. of Biology.
A. R. O. Chapman, J. W. Markham, and K. Luning.
Journal of Phycology, Vol. 14, No. 2, p 195-198, 1978. 5 fig, 1 tab, 16 ref.

Descriptors: *Nitrates, *Laminaria saccharina, *Plant growth, *Plant physiology, *Limiting factors, *Nutrients, Nitrogen, Carbon, Chlorophyll, Phaeophyta, Algae, Cultures, Half-saturation constant, Photosynthesis, Satuartion, Helgoland(West Germany), West Germany, St. Margaret's Bay(Nova Scotia Canada), Canada, Nova Scotia(Canada), North Sea, Seas, Bays, Solar radiation.

The growth response of the brown alga Laminaria saccharina to various nitrate concentrations in laboratory culture was approximately linear up to 10 microM substrate concentration. The half-saturation constant (K sub s) was about 1.4 microM NO3. Internal nitrate levels increased at substrate concentrations above 10 microM NO3 and reached levels several thousand times higher than the surrounding medium, indicating luxury nitrate consumption. Chlorophyll content and photosynthetic capacities of the plants also increased with increasing external nitrate. Sporophytes of L. saccharina were grown in flow-through enriched and synthetic media with nitrate concentrations of 0,3,10,20,100, and 500 microM. Gametophytes were obtained from parental saturation level for growth (about 10 microM NO3) is within the range found at Helgoland. In the experiments at the two flow rates tested (3.3 and 1.6 liters/day) growth rates were not significantly different. Comparison of the results to Laminaria populations in St. Margaret's Bay, Nova Scotia, Canada, suggests that in winter, light is the limiting factor since nitrate is stored internally, but nitrate is probably limiting in spring and summer when irradiance increases. (Lynch-Wisconsin)

Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Journal of Phycology, Vol. 14, No. 2, p 224-234, 1978. 21 fig, 3 tab, 28 ref.

Descriptors: *Red tide, *Gonyaulax tamarensis, *Gonyaulax excavata, Hypnocysts, *Growth stages, *Reproduction, Cysts, Algae, Phytoplankton, Dinoflagellates, Eutrophication, Estuaries, *Cape Cod(MA), Massachusetts, Toxicity, Toxins, Chelation, Motility, Light, Canada, New England, Pellicle cyst, Plant growth, Life cycles, Sediments.

Thick-walled, nonmotile cysts ('hypnocysts') of two toxic, red tide dinoflagellates isolated from estuarine sediments at Cape Cod, Massachusetts are concluded to be important in seeding the recurrent annual blooms, synchronizing early bloom development with vernal warming of seawater, and increasing the geographic range of the species. The species were identified as Gonyaulax tamarensis (Falmouth district) and G. excavata (Orleans district) after the hypnocysts were germinated to produce their motile, thecate stages. Laboratory incubation of the hypnocysts at 16 C, which had been stored in the dark at 5 C for 6 mo, initiated excystment by the temperature increase, with no appreciable effect from light regime, nutrient, or chelator concentrations. Germling motility was optimum in highly chelated medium and eastern Canadian waters are initiated through the displacement of motile estuarine populations into nearshore areas by tidal advection and surface runoff, although the potential existence and importance of offshore cyst reservoirs cannot be discounted. Evidence is presented that hypnocysts are probably sexual zygotes, whereas the thin-walled cysts readily formed in laboratory cultures (pellicle cysts) are asexual. Pellicle cysts are of limited durability, do not overwinter in nature, and therefore do not play a significant role in initiating toxic blooms. (Lynch-Wisconsin)

TROPHIC STRUCTURE MODIFICATIONS BY PLANKTIVOROUS FISH IN AQUATIC MICROCOSMS,
California Univ., Berkeley. Lawrence Berkeley Lab.
A. Jassby, J. Rees, M. Dudzik, D. Levy, and E. Lapan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 342, Price codes: A02 in paper copy, A01 in microfiche. Report EPA-600/7-77-096, August 1977. 18 p, 2 tab, 14 ref. EPA-IAG-DS-E681/Contract No. 77BCC.

Descriptors: *Trophic level, *Fish, *Planktivores, *Eutrophication, *Zooplankton, *Predation, *Food webs, Phytoplankton, Algae, Mosquito fish, Gambusia affinis, Simocephalus vetulus, Alona guttata, Cladocera, Grazing, Rotifers, Carbon, Nitrogen, Phosphorus, Nutrients, Organic compounds, Inorganic compounds, Chlorophyll, Anabaena, Research equipment, Microcosms.

Addition of two 2.5-cm zooplanktivorous mosquito fish (Gambusia affinis) to two of four 700-liter freshwater microcosms shifted zooplankter dominance from the large cladoceran Simocephalus vetulus to the smaller Alona guttata. The resultant decrease in grazing pressure raised phytoplankton

and bacteria levels, in turn increasing rotifer biomass. In tanks with Gambusia, particulate organic carbon concentration was higher and dissolved inorganic nitrogen concentration lower than in the controls, reflecting a net shift of nutrients from inorganic to organic, presumably due to smaller zooplankton respiratory losses. In the microcosms with fish, ratios of particulate to dissolved organic carbon, and of phytoplankton carbon, and of phytoplankton carbon to chlorophyll-a, were unnaturally high. In all four systems there was an increase in total nitrogen, probably caused by heterocystous Anabaena sp and not by the presence of Gambusia. Each microcosm, consisting of a fiberglass cylinder 1.2 m in diameter, was filled to a depth of 60.1 cm with demineralized water, then enriched with a modified common freshwater algal growth medium and inoculated with a 3.5-liter water sample from small, eutrophic Lake Anza in Berkeley, California. Nutrient enrichment levels are sufficient for eventual nitrogen limitation of algal growth, and the initiation conditions give rise to a phytoplankton bloom that is terminated by zooplankton grazing within two months. (Lynch-Wisconsin)
W79-02013

ROLE OF INORGANIC IONS IN CONTROLLING SEDIMENTATION RATE OF A MARINE CENTRIC DIATOM DITYLUM BRIGHTWELLI,
California Univ., Santa Barbara. Dept. of Biological Sciences.
L. W. J. Anderson, and B. M. Sweeney.
Journal of Phycology, Vol. 14, No. 2, p 204-214, 1978. 14 fig, 3 tab, 50 ref. NSF GB-35247.

Descriptors: *Ditylum brightwelli, *Ion transport, *Sedimentation rates, *Diel migration, *Biorhythms, *Diatoms, Algae, Inorganic compounds, Ions, Marine algae, Centric diatoms, Potassium, Sodium, Chlorine, Magnesium, Calcium, Photoperiodism, Darkness, Light, Buoyancy, Vacuoles, Settling velocity, Phytoplankton.

The settling rate of the marine centric diatom Ditylum brightwelli is shown to be controlled by intracellular levels of potassium, sodium, and chlorine ions; no significant change in magnesium or calcium ions was found. Cells at the end of the dark period had high sodium (118 mM), low potassium (64 mM), and low chlorine (117 mM) ion levels compared with levels at the end of the light period when sodium was low (101 mM), and potassium, (126 mM) and chlorine (154 mM) were high. Magnesium (16-18 mM) and calcium (3-4 mM) remained relatively unchanged. The net result of the ion changes during the light period is to increase cell density by about 3.4 mg/ml, which can account for the increase in settling rate of about 0.3 m/day during the same interval. The density of the cell contents, calculated from observed ion concentrations, is 15-18 mg/ml less than that of the seawater medium. The ion and settling rate changes are light-dependent and do not persist in the dark or under constant light (about 850 lx), but cells do exhibit a free-running circadian rhythm in cell division under continuous dim illumination. The cell vacuole expands during the light period and contracts during the dark, apparently in response to the net ion fluxes. D. brightwelli appears to regulate its density by active ion selectivity accompanied by trans-vacuolar water movement. Axenic batch cultures of the alga were maintained in three-liter flasks containing 1-1.5 liters of enriched seawater medium IMR at 20C on an 8:16 light-dark cycle. (Lynch-Wisconsin)

KINETICS OF PHOSPHATE UPTAKE BY AQUATIC MICROORGANISMS: DEVIATIONS FROM A SIMPLE MICHAELIS-MENTEN EQUATION,
Wisconsin Univ.-Madison. Dept. of Soils.
E. J. Brown, R. F. Harris, and J. F. Koonce.
Limnology and Oceanography, Vol. 23, No. 1, January 1978, p 26-34. 5 fig, 1 tab, 38 ref. NSF AG-199 BMS76-00761 193-69.

Descriptors: *Kinetics, *Michaelis-Menten equations, *Phosphates, *Absorption, *Microorganisms, *Eutrophication, Equations, Selenastrum capricornutum, Algae, Phytoplankton, Inorganic compounds, Radioisotopes, Lake Wingra(WI), Wisconsin, Bioassay, Mathematical studies.

Uptake kinetics of dissolved inorganic phosphate (31P sub i) by lake water microorganisms and by the green alga Selenastrum capricornutum determined as a function of uptake rates of radiophosphate (32P sub i), at added 31P sub i levels > or = 0, did not follow a simple Michaelis-Menten equation. The equation used was: C/v* = A/V + (K sub v + S sub n)/V. Axenic cultures of S. capricornutum were maintained in PAAP medium, and large volumes of water from the surface of small, eutrophic lake Wingra (Madison, Wisconsin) were used for 31P sub i uptake kinetic evaluations. For the lake water sample, deviations of 31P sub i uptake from the equation shown by the curvilinear responses of the plots of C/v* vs. A can be interpreted as caused by the presence of different microorganisms with varying half-saturation constants for uptake of 31P sub i. Similarly, such a curvilinear response for the axenic green alga is consistent with its having more than one system for phosphate uptake, with differing half-saturation constants. While uptake rates obtained from high level 31P sub i-perturbation experiments are generally hyperbolic versus the added 31P sub i uptake rates as estimated by back-extrapolations assuming adherence to a simple Michaelis-Menten equation must be otherwise verified. This is particularly true for the very low 31P sub i levels common in 31P sub i-limited aquatic ecosystems. (Lynch-Wisconsin)

A MATERIAL BALANCE STUDY OF POLYCHLORINATED BIPHENYLS IN LAKE MICHIGAN,
Dow Chemical Co., Midland, MI. Environmental Science Research Lab.
W. B. Neely.
The Science of the Total Environment, Vol. 7, p 117-129, 1977. 1 fig, 4 tab, 22 ref, 1 append.

Descriptors: *Lake Michigan, *Polychlorinated biphenyls, *Mathematical models, *Water pollution source, *Sediment-water interfaces, Model studies, Absorption, Deposition(Sediments), Chemical degradation, Distribution patterns, Estimating equations, Path of Pollutants, Industrial wastes.

A proprietary study was made (1) to identify possible input sources necessary to maintain observed polychlorinated biphenyl (PCB) levels in the Lake Michigan biomass; and (2) to develop a mathematical model that could predict trends in distribution of these chemicals introduced into the lake environment. By integrating known chemical and physical properties of PCB with a mathematical model describing their behavior in the lake the following conclusion was reached: Persistent high levels of PCB in Lake Michigan are not caused by municipal or industrial waste discharge, or fall-out from rain and snow, but are the result of PCB released from lake bottom sediments. Prior to 1970 there was a large input of PCB into Lake Michigan. Due to inertness and high absorption coefficient, the material accumulated in bottom sediments. Since 1970, with a decrease of dispersive uses, the accumulated material is now serving as a major input source into the water. Due to the long time constants it will take several years for the Lake Michigan ecosystem to clean itself. The main factor behind this cleansing action is the concentration gradient that exists in the air/water interface (Harris-Wisconsin)

APPLICATION OF A MODEL OF ZOOPLANKTON COMPOSITION TO PROBLEMS OF FISH INTRODUCTIONS TO THE GREAT LAKES.
State Univ. of New York at Albany Dept. of Biological Sciences.
D. C. McNaught, and D. Scavia.
Rensselaer Fresh Water Institute Report No. 77-4, 1977. 4 fig, 5 tab, 30 ref. Also in: Modeling Biochemical processes in Aquatic Ecosystems, p. 281-304. 4 fig, 5 tab, 30 ref. NSF AG-199, BMS 69-01147-A09.

Descriptors: *Lake Michigan, *Lake Ontario, *Mathematical models, *Predation, *Fish, *Zooplankton, *Simulation analysis, Eutrophication, Succession, Species composition, Great Lakes, Lakes, Alewife, Alosa pseudoharengus, Bosmina longirostris, Daphnia, Diaptomus, Simulation analysis, Model studies, Water management(Applied), Seasonal, Size, Detritus, Food habits, Algae, Phytoplankton, Population dynamics, *Bioindicators.

A simple two-equation model was used to examine the relative importance of size selection by fish predators on zooplankton in Lakes Michigan and Ontario, as well as effects of nonuniform seasonal inshore distribution of the fish upon both zooplankton composition and abundance. The simulations imply that: (1) fish predation is the principal factor controlling zooplankton composition, (2) Bosmina logirostris is an indicator of predatory pressure and not solely of advanced eutrophication or shifts to larger algal species, and (3) inshore alewife (Alosa pseudoharengus) spawning populations in May and June largely determine summer zooplakton composition. Model inputs include: (1) available phytoplankton and detrital food resources, (2) food selectivity of zooplankton, and (3) size-selective predation by fishes (fish biomass times selectivity) Fish predation is the primary determinant of zooplankton species succession, while algal productivity influences relative species abundance. The model's real-time output can easily be used to determine when the system had reached steady-state, the main criterion in determining when to examine community composition; the output provides estimates of zooplankton and resource numbers at intervals. The model as calibrated for Lake George, New York (reported elsewhere), and is used here to simulate predation by alewife (and salmonids in Lake Michigan prior to 1954) on three common crustaceans: Diaptomus spp, Daphnia spp, and B. longirostris. PREDICTION OF PHYTOPLANKTON PRODUCTIVITY IN LAKES.
Environmental Monitoring and Support Lab., Las Vegas, NV.
V. W. Lambou, L. R. Williams, S. C. Hern, R. W. Thomas, and J. D. Bliss.
In: Report EPA 600-9-76-016, Proceedings of the Conference on Environmental Modeling and Simulation, p 696-700, July 1976. 1 tab, 26 ref.

Descriptors: *Classification, *Lakes, *National Eutrophication Survey, *Phytoplankton, *Chlorophyll, *Primary productivity, *Eutrophication, *Phosphorus, Algae, Forecasting, Hydrology, Hydraulic residence time, Nutrients, Ammonia, Parameters, Limiting factors, Nitrogen, Stratification, Macrophytes, Water pollution effects, Trophic levels, Reservoirs, Bioassay.

1972 National Eutrophication Survey data were used to help establish lake classes and determine relationships between ambient nutrients and lake water quality by lake type. Phosphorus correlated most strongly with phytoplankton productivity as measured by yearly mean chlorophyll-a levels Sixty-nine lakes were classified as phosphorus-limited (N/P >14), 44 as transitional (N/P between 10-14), and 79 as nitrogen-limited (N/P <10) Chlorophyll-a development increased with hydraulid retention time (RT) up to about 14 days; at RT 14, 71% of the variation in chlorophyll-a was explained by changes in total phosphorus (TP) levels. Chlorophyll-a correlations with dissolved phosphorus (DP) resembled total phosphorus correlations, but were lower in all subpopulations. TP-DP/chl-a ratios were consistent between freshwater and marine communities according to comparisons with other studies. TP is a good approximaton of bioavailable phosphorus. Of nitrogen forms, ammonia-nitrogen (NH) was most strongly correlated with mean chl-a, but (with other dissolved nitrogen forms) was strongest in phosphorus-limited lakes, declined in transitional lakes, and

was very weak in nitrogen-limited lakes. The relationship of pH and alkalinity to chl-a was much stronger in phytoplankton- than macrophyte-dominated lakes. Turbidity and Secchi disc were negatively correlated with chl-a. Stratification had little effect on most parameters except ammonia and nitrite-nitrate-nitrogen. P-32 UPTAKE IN LENTIC ALGAE,
Georgia Inst. of Technology, Atlanta. School of Biology.
J. R. Strange, G. D. Williamson, and D. J. Fletcher.
Environmental Letters, Vol. 9, No. 1, p 1-5 1975. 4 fig, 4 ref. OWRT A-035-GA(2), 14-31-0001-3510.

Descriptors: *Algae, Phosphorus radioisotopes, Nostoc, *Absorption, Lakes, Eutrophication, *Georgia, *Lake Sidney Lanier(Geo), *P-32 uptake, Chlorococcum, Fragillaria, Eutropic lakes.

A study of the Flat Creek Embayment of Lake Sidney Lanier near Gainesville, Georgia revealed three genera of algae, Chlorococcum, Fragillaria and Nostoc, to be prominent in this eutrophic region of the lake. The algae were grown in phosphate-rich media and subsequently labelled with P-32. All species incorporated luxury amounts of phosphorus as determined by the uptake of P-32. The results indicate that the P-32 uptake is proportional to the surface-per-volume ratio. The higher surface-per-volume ratio resulted in greater uptake of P-32.

AMINO ACIDS IN SALT MARSH DETRITUS,
Mississippi State Univ., Mississippi State. Dept. of Zoology.
A. A. de la Cruz, and W. E. Poe.
Limnology and Oceanography, Vol. 20, No. 1, p 124-127, January, 1975. 2 tab, 12 ref.

Descriptors: *Amino acids, *Salt marshes, *Detritus, *Marsh plants, Vegetation, Nutrients, Degradation, Decomposing organic matter, Proteins, Nitrogen, Estuaries, Marshes.

Amino acids declined by more than 50% on death of marsh plants, but increased again almost to the level of the living plant during in situ decomposition. A decline in the ratio of total amino acid to crude protein in spite of increases in both amino acids and crude proteins implies nitrogen sources in the marsh other than the amino acids and ammonia in the plants. Suspension feeders may be exposed to food particles of even higher nutrient level than are the grazers on the marsh plants. The analyses support the general observation that estuarine detritus may be a food source of high nutritional value. (Maroncelli-Mass)

PRIMARY PRODUCTION IN A SHALLOW WATER LAKE WITH SPECIAL REFERENCE TO A REED SWAMP,
Odense Univ. (Denmark). Biological Inst.
F. O. Anderson.
Oikos, Vol. 27, No. 2, p 243-250, 1975.

Descriptors: *Primary productivity, *Rooted aquatic plants, Aquatic plants, Phytoplankton, Lakes, Wetlands, *Denmark, Reeds, Eutrophication, Eutrophic lakes.

Phytoplankton gross primary production (C14 method) in the shallow, eutrophic Danish Lake Arreso in 1973 was 980 g C/sq m; calculated net primary production was near zero. Marcophyte net primary production of the reed swamp was measured by harvesting the maximum biomass at three localities dominated by Phragmites or Scirpus. Above ground values were between 420 and 1325 g ash free dry wt/sq m, while below ground values were between 2480 and 8570 g ash free dry wt/sq m. The reed swamps were mapped on aerial photographs, and the composition of the macrophyte vegetation was determined. A comparison of macrophyte vegetation in 1944 and 1972 showed a reduction in species diversity, especially of submerged species. (Stihler-Mass)

THE ROLE OF SILICA AND THE VERNAL DIATOM BLOOM IN CONTROLLING THE GROWTH OF NUISANCE ALGAL POPULATIONS IN LAKES,
Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
B. W. Vigon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 683, Price codes: A14 in paper copy, A01 in microfiche. M.S. Thesis, 1976. 290 p, 35 fig, 41 tab, 278 ref, 3 append. OWRT A-061-WIS(2), 14-31-0001-3850, 14-31-0001-5050.

Descriptors: *Silica, *Phosphorus, *Diatoms, *Eutrophication, *Wisconsin, Lakes, *Algal control, *Nuisance algae, Water pollution effects, Water pollution control, *Lake Mendota(Wis).

The role of the vernal diatom population in the removal of P and Si from the lake water was evaluated for Lake Mendota, Madison, Wisconsin in 1974. Measurements were made of total and dissolved reactive P and Si (DRP and DRSi) in the lake water as a function of depth over the period from ice-out (March 3) to the development of thermal stratification (June 3). The amounts of P and Si in the lake water decreased markedly between March 3, and May 1. This time period corresponded to the development and sedimentation of the vernal diatom population. Maximum apparent removals of DRP and DRSi were about 40 and 94%, respectively. Corresponding values for removal of total P and diatom Si were 21 and 72%, respectively. Following sedimentation, mineralization of the diatom population apparently contributed to an increase in the levels of both P and Si in the lake water. Through a combination of field and laboratory measurements, the inputs of Si and P from the drainage basin and the bottom sediments and the losses via outflow were estimated. Using this information and the apparent removal values, the net amounts of P and Si removed by the diatom population were estimated. The net amounts prior to thermal stratification were 62% for DRP and 72% for DRSi. The results show that the vernal diatom population can substantially reduce the amounts of P available to support the growth of nuisance blue-green algae during the summer. (Armstrong-Wis)

The toxicity of antimycin to 38 species of Wisconsin stream insects was evaluated in static, aerated bioassays utilizing antimycin exposures typical of stream treatments used to kill fish. Several species of Trichoptera, Ephemeroptera and Plecoptera were very sensitive to fish killing concentrations of antimycin (EC-50 less than 50 ppb). Beetles (Psephenus herricki, Optioservus fastiditus, Stenelmis crenata, Helichus striatus, dragonfly nymphs (Neurocordulia molesta, Gomphurus vastus), damselfly nymphs (Argia apicalis), fishfly larvae (Nigronia serricornis), and snipe fly larvae (Atherix variegata) were relatively unaffected by anticmycin (EC-50 greater than 1,000 ppb). Early instars of Tipula spp. and Ephemerella sp. were more sensitive to anticmycin than later instars. Exposure to antimycin produced greater mortality at 19C than at lower temperatures in several species, even though exposure times were reduced at the higher temperature. Post-exposure observations indicated mortality may be delayed more than five days, particularly at reduced temperatures. Large differences in antimycin sensitivity were found for different species belonging to the same family (hydropsychid caddisflies, perlid stoneflies). Emergence of several species of stream insects was reduced or prevented by exposure of the mature larvae or nymphs to sublethal concentrations of antimycin. Pycnopsyche guttifer emerged successfully following exposure of the pupae to an antimy-

cin concentration just below that which killed the larvae. (Hilsenhoff-Wis)

SEASONAL FLUCTUATION OF WATER QUALITY (NUTRIENTS AND PIGMENTS) IN LOWER DELAWARE BAY,
Delaware Univ., Lewes. Marine Studies Complex.
D. Maurer, L. Watling, D. Bottom, and A. Pembroke.
Hydrobiologia, Vol. 60, No. 3, p 203-211, 1978. 8 fig, 1 tab, 17 ref.

Descriptors: *Delaware Bay, *Water quality, *Basic data collections, *Seasonal, *Nutrients, *Pigments, *Bays, *Estuaries, Mid-Atlantic Bight, Chlorophyll, Salinity, Water temperature, Dissolved oxygen, Silicates, Nitrates, Nitrites, Orthophosphate, Ammonia, Phaeopigments, Carotenoids, Baseline studies, Marshes, Chesapeake Bay, Raritan Bay,Narrangansett Bay(RI), Long Island Sound,

May 1974-May 1975 baseline data show that the lower Delaware Bay estuary is similar to other estuaries and bays in the mid-Atlantic bight in regard to seasonal fluctuations of nutrients and pigments. The first set of seasonal water quality baseline date for the bay indicates nutrient and pigment concentrations reflect seasonal nutrient patterns in the marshes to a certain degree. All of the estuaries compared, including Delaware, Narrangansett, Raitan, and Chesapeake Bays, and Long Island Sound, had high dissolved oxygen (DO) in winter, and most had undersaturated DO in summer, except Long Island Sound which was high in winter. Pigment concentrations were similar among the estuaries, but seasonal peaks varied. Nitrate, nitrate and inorganic phosphate levels in Delaware Bay were closest to those of Chesapeake Bay. Lower Delaware Bay did not show excess nutrient pollution, based on nitrogen/phosphorus ratios. In Delaware Bay surface and bottom water samples were analyzed for temperature, salinity, DO, silicate, nitrate, and nitrite, orthophosphate, ammonia, chlorophylls-a,-b, and-c, phaeopigments, and carotenoids. Salinity ranged from 22.9-29.7%, and DO from 4.53-8.53 ml/1. Silicate (30.3 micrograms-at/1) and orthophosphate (1.59) were highest in September; ammonia in July (6.8); nitrate and nitrite in January (24.27), February (18.2), and May (16.37); and chlorophyll-a in August (17.2), October (15.7), and March (15.33). (Lynch-Wisconsin)

PHOTOSYNTHETIC RATES OF MARINE ALGAE AS A FUNCTION OF INORGANIC CARBON CONCENTRATION,
Hawaii Inst. of Marine Biology, Honolulu.
J. Caperon, and D. F. Smith.
Limnology and Oceanography, Vol 23, No. 4, p 704-708, July 1978. 2 fig, 1 tab, 14 ref.

Descriptors: *Carbon, *Inorganic compounds, *Photosynthesis, *Marine algae, *Phytoplankton, *Michaelis-Menten equations, *Sea water, Algae, Nutrients, Estuaries, Port Hacking estuary(Australia), Australia, Dinoflagellates, Diatoms, Amphidinium carterae, Chlorella vulgaris, Phaeodactylum tricornutum, Inorganic carbon, Axenic cultures.

The relationship between phytoplankton growth rate in seawater and inorganic carbon concentration is quantatively described for the first time, and applicability of the Michaelis-Menten equation to both single-species and mixed-species marine phytoplankton populations is demonstrated. Inorganic carbon concentrations resulting in half-maximal fixation rates ranged 4.3-5.3 mg C/liter for mixed phytoplankton and 0.8-2.8 for axenic cultures of three algal species. Water samples were collected from the Port Hacking estuary, Australia, May-June 1975 and May 1976, and the plankton concentrated; the latter were composed mainly of diatoms and dinoflagellates. Log phase cultures of Amphidinium carterae, Chlorella vulgaris, and Phaeodactylum were grown in medium f. Algae were added to seawater of varying dissolved organic carbon (DIC) concentrations. The half-saturation constant values (K sub s) obtained imply not only that phytoplankton required 2.8 times the DIC concentration of the axenic algal cultures to reach the half-maximal carbon fixation rate, but the presence of the S sub o term (threshold concentration) indicates that phytoplankton required 0.88 mg C/liter as DIC before net carbon fixation could occur. It is suggested that the apparent distinguishing features of the phytoplankton may be due to the microheterotrophic components of such samples. (Lynch-Wisconsin)

SIMULATION MODEL OF CRYPTOMONAS OVATA POPULATION DYNAMICS IN SOUTHERN KOOTENAY LAKE, BRITISH COLUMBIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. E. Cloern.
Ecological Modelling, Vol. 4, No. 2-3, p 133-149, February, 1978. 12 fig, 27 ref. EPA R-800430.

Descriptors: *Kootenay Lake(B C Canada), *Simulation analysis, *Cryptomonas ovata, *Phytoplankton, *Advection, *Population dynamics, Model studies, British Columbia(Canada), Canada, Lakes, Mathematical models, Algae, Flagellates, Water circulation, Zooplankton, Anabaena, Grazing, Nutrients, Ammonium, Phosphates, Plant growth, Kinetics, Seasonal, Primary productivity, Photosynthesis.

A one-dimensional transient model is developed to simulate observed population dynamics of the small flagellate Cryptomonas ovata in southern Kottenay Lake (British Columbia, Canada) during a one-year period (June 1974-May 1975). The model considers advective displacement of the alga as water flows from the Kootenay River at the southern entrance to the lake and moves toward the sampling sites 11 km north of the river mouth. Specific growth rate is computed from an experimentally determined function of mean irradiance, water temperature, and nutrient concentrations (ammonium and phosphate) in the upper 10 m of the water column. Cell losses are assumed to result from zooplankton grazing and inhibition due to presence of the blue-green alga Anabaena. The model simulates well the timing and magnitude of all observed population changes except for a failure to time the autumn pulse accurately, and gives insight into the important mechanisms which regulate population density of C. ovata in this natural system. Modelling of individual algal species stressing their unique physiological characteristics is important in more precisely simulating overall phytoplankton population dynamics, species composition, and primary productivity. Output of individualized models will be valuable in explaining seasonal succession and secondary productivity (Lynch-Wisconsin)

A PATTERN ANALYSIS OF CLEAR LAKE PHYTOPLANKTON,
California Univ., Berkeley Lawrence Berkeley Lab.
J. C. Sandusky, and A. J. Horne.
Limnology and Oceanography, Vol. 23, No. 4, p 636-648, July 1978. 1 fig, 6 tab, 44 ref

Descriptors: *Phytoplankton, *Clear Lake(CA), *Spatial distribution, *Synoptic analysis, *Patchiness, *Statistical models, *Pattern analysis, Algae, California, Lakes, Measurement, Methodology, Analytical techniques, Model studies, Mathematical models, Statistical methods, Dominant organisms, Water chemistry.

Synoptic measurements of phytoplankton distribution in Clear Lake, California, and statistical methods were used to develop a systematic approach for interpreting synoptic surveys in the form of a distribution function. The resulting model was used to analyze water chemistry and phytoplankton data from Clear Lake; 43 sets of data representing 18 freshwater phytoplankton genera yielded reliable results using three fitted parameters per set. Local and regional variability were explicitly separated to avoid overestimating regional variability (patchiness) through counting individual cells of colonial or locally associated species as independent units. patchiness estimates showed significant interspecific variations related to nutrient variability, relative species dominance, and species sensitivity. Pooling cell frequencies for related species reduced patchiness estimates, implying that compaisons of spatial relations between biotic and abiotic parameters underestimate phytoplankton spatial organization when several species are present. In both marine and freshwater systems, phytoplankton patchiness is common and appears to be ecologically significant. Early studies were chiefly qualitative; recent quantitative studies can be categorized according to transect or synoptic sampling strategies. In a synoptic study water samples are collected from many sites over a large area; this method is useful where horizontal variation in more than one direction occurs, or where circulation, topographic, or inflow effects must be considered. THE UPTAKE, RETENTION, AND RELEASE OF AMMONIUM BY REEF CORALS,
California Univ., Los Angeles. Dept. of Biology.
L. Muscatine, and C. F. D'Elia.
Limnology and Oceanography, Vol. 23, No. 4, p 725-734, July 1978. 8 fig, 1 tab, 35 ref. NSF L.M. (PCM 74-91874).

Descriptors: *Ammonium, *Symbiosis, *Coral, *Zooxanthellae, *Nitrogen, *Essential nutrients, Nutrients, Pacific Ocean, Reefs, Michaelis-Menten equations, Diffusion, Oceans, Absorption, Light, Photoperiodism, Kinetics, Nutrient budgets, Darkness, Algae, Recycling, Cycling nutrients, Photosynthesis, Retention, Pocillopora, Tubastrea aurea, Porites lutea

A study of ammonium flux in Pacific reef corals (as part of construction of a nitrogen budget) showed that of three coral genera tested, only those symbiotic with zooxanthellae (chrysophyte algae) take up and retain ammonium. Uptake and retention were enhanced by light, and the normal daylight period was sufficient to sustain ammonium retention during the night for at least one coral (Pocillopora capitata). The effect of light was undoubtedly a function of zooxanthellar photosynthesis. Ammonium uptake kinetics for three species indicated that a two-process mechanism may be involved. With a correction for diffusion, uptake kinetics can be characterized by the Michaelis-Menten equation $V = (V_{max} S)/(K_s + S)$. The symbiotic corals seem generally well-adapted to

cope with a paucity of environmental nitrogen, retaining virtually all of the animal excretory ammonium and having the ability to scavenge ammonium from the environment. By preventing ammonium loss during night as well as day, and as a result of the translocation of combined nitrogen from algae to host, the coral-algal complex may recycle some combined nitrogen, which would help it to tolerate an environmental deficiency. Specimens were collected at Hawaii, Enewetak (northern Marshall Islands), Clarion Island (eastern Pacific), and the Great Barrier Reef (Australia). Species included Pocillopora damicornis, P. meandrina, P. capitata, Tubastrea aurea, and Porites lutea. (Lynch-Wisconsin)

RELATIONSHIPS AMONG SUBSTRATE, FLOW, AND BENTHIC MICROALGAL PIGMENT DENSITY IN THE MECHUMS RIVER, VIRGINIA,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
P. Tett, C. Gallegos, M. G. Kelly, G. M. Hornberger, and B. J. Cosby.
Limnology and Oceanography, Vol. 23, No. 4, p 785-797, July 1978. 6 fig, 3 tab, 24 ref. NSF GB 32914.

Descriptors: *Mechums River(VA), *Pigments, *Substrates, *Streamflow, *Periphyton, *Biomass, Rivers, Virginia, Algae, Photosynthesis, Chlorophyll, Measurement, Estimating, Benthic flora, Microalgae, Spatial distribution, Current(Water), Patchiness, Sediments, Plant growth, Floods, Scour, Nutrients.

High streamflow due to unpredictable and heavy rainfall was the main factor controlling periphyton biomass in the Mechums River, a small river in the Virginia Piedmont; deterministic predictions of algal crop are therefore not possible in rivers of this type. Periphyton biomass was estimated on soft and hard substrates using measurements of photosynthetic pigments, which provided a faster method of quantifying the microalgae than direct estimation of algal numbers. The irregular distribution of periphyton was partially related to substrate distribution and is explained as a result of spatial variations in the current regime in the river. Results indicate a complex relationship between current velocity, prior flow regime, substrate type, and pigment density. Although nutrient levels probably control maximum biomass, the amount of variation in the chlorophyll density of samples from the same part of the river shows that nutrients do not play a major role in determining biomass at any particular point. The flow regime, which controls actual biomass, also determines the type of sediment. Likewise, although light and water temperature must influence periphyton growth rate, such effects are masked by the catastrophic effects of floods, which are more frequent in winter due to the reduced capacity of the soil to absorb participation. Effects of washout and scour become crucial during floods. (Lynch-Wisconsin)

SEASONAL CHANGES IN THE EPIPHYTE COMMUNITY OF NATURAL AND ARTIFICIAL MACROPHYTES IN LAKE MEMPHREMAGOG (QUE. AND VT.),
McGill Univ. (Montreal). Dept. of Biology.
A. Cattaneo, and J. Kalff.
Hydrobiologia, Vol. 60, No. 2, p 135-144, 1978. 9 fig, 2 tab, 28 ref.

Descriptors: *Seasonal, *Epiphytes, *Artificial substrates, *Potamogeton richardsonii, *Macrophytes, *Lake Memphremagog(VT Quebec), *Canada, Vermont, Quebec(Canada), Lakes, Substrates, Biological communities, Biomass, Chlorophyll, Species composition, Bays, Shallow water, Phytoplankton, Algae, Succession, Ecology, Calcium carbonate, Sessile algae, Species diversity, Leaves.

Seasonal changes in epiphyte biomass (measured as chlorophyll-a and cell volume) and species composition were compared on Potamogeton richardsonii and on a similar plastic plant in a shallow bay of Lake Memphremagog in Vermont and Quebec, Canada. Community development and diversity were both higher on the natural plant, apparently the result of summer accumulation of calcium carbonate observed only on the upper leaf surfaces of the natural plants. Precipitation of calcium carbonate by P. richarsonii constitutes its main effect on epiphyte development; there is no evidence for either direct inhibition or stimulation of epiphytes by the natural plants. Reduced epiphyte biomass on growing tips is attributable to an insufficient time for colonization rather than to inhibition by the macrophyte. Both the natural and artificial substrates exhibited two periods of high biomass during the June-September (1975) growing season: (1) in June, when the community was dominated by loosely attached species with a strong phytoplanktonic component (up to 37%), and (2) in September, when epiphytes were characterized by species tightly attached to the leaves. During both periods communities were better developed on the natural plants. Pairs of natural and artificial plants were planted at depths of 40-90 cm, and harvested randomly (generally weekly); 108 algal species were identified among the epiphytes: 90 species of Chrysophyta, 13 species of Chlorophyta, and five species of Cyanophyta. RELEASE OF DISSOLVED ORGANIC CARBON BY GRAZING ZOOPLANKTON,
Frankfurt Univ. (West Germany). Fachbereich Biologie.
W. Lampert.
Limnology and Oceanography, Vol. 24, No. 3, p 831-834, July 1978. 2 tab, 12 ref.

Descriptors: *Dissolved organic carbon, *Daphnia pulex, *Grazing, *Phytoplankton, *Zooplankton, Carbon, Organic matter, Particulate organic carbon, Cladocera, Algae, Carbon radioisotopes, Tracers, Lakes, Asterionella formosa, Stichococcus minutissimus, Stephanodiscus hantzschii, Nitzschia actinastroides, Cryptomonas ovata, Scenedesmus acutus, Secretion, Feces.

A conclusion that the cladoceran Daphnia pulex releases significant dissolved organic carbon (DOC) while feeding on six phytoplankton species found in freshwater lakes contradicts Wetzel's assumption that DOC excretion by zooplankton and higher animals is quantitatively negligible. The algal species were labelled with carbon-14 in the tests, designed to determine: (1) the amount of DOC released during ingestion, (2) DOC released by Daphnia secretion, (3) DOC released via leaching from Daphnia feses, and (4) the extent to which DOC release is dependent upon the algal food species. Up to 17% of the algal carbon was initially lost as DOC because of breakage of the diatoms Stephanodiscus hantzschii and Asterionella formosa and the relatively large flagellate Crytomonas ovata, while only 4% of carbon was lost from the other three species, which were swallowed whole. The latter species was the chlorophytes Scenedesmus acutus and Stichoccus minutissimus and the diatom Nitzschia actinastroides. Additional DOC was produced through Daphnia secretion and by leaching from feces. A total of 10-17% of the algal particulate organic carbon consumed by the daphnoids was transformed to DOC for all species except Stichoccus which was negligible. During periods when phytoplankton primary production is totally consumed by zooplankton, more than 10% of carbon fixed in photosynthesis is approximately added to the DOC pool through grazing zooplankton. NUTRIENT AND PARTICULATE FLUXES IN A SALT MARSH ECOSYSTEM: TIDAL EXCHANGES AND INPUTS BY PRECIPITATION AND GROUNDWATER,
Marine Biological Lab., Woods Hole, MA. Boston Univ. Marine Program.
I. Valiela, J. M. Volkmann, D. Shafer, and E. J. Carpenter.
Limnology and Oceanography, Vol. 23, No. 4, p 798-812, July 1978. 9 fig, 7 tab, 40 ref. NSF GA-43008,GA-43009.

Descriptors: *Nutrient flux, *Particulates, *Salt marshes, *Great Sippewissett Marsh(MA), *Nitrogen, *Organic matter, Nutrient budgets, Limiting factors, Massachusetts, Nutrients, Ecosystems, Spartina alterniflora, Ammonium, Phosphates, Nitrates, Nitrites, Marsh plants, Groundwater, Rain, Carbon, Phosphorus, Import, Export, Precipitation(Atmospheric), Tidal effects, Tidal marshes.

Budgets of nitrogen species and particulate organic matter in Great Sippewissett Marsh, a tidal salt marsh at Falmouth, Massachusetts, by rain, flow of fresh groundwater, and the tidal exchanges were studied. Although it is generally believed that salt marshes export organic materials, the nature and extent of exchange between marshes and coastal waters has not been well understood. This study shows that during summer, uptake by marsh biota leads to net nutrient import, but there is a net annual export of ammonium, nitrate, nitrite, dissolved organic nitrogen (DON), particulate nitrogen (PN), particulate carbon (PC), and phosphate Increased ammonium export in August may be due to leaching from senescent marsh plants. Major nitrogen forms exported are ammonium, DON, and PN, and exports may contribute substantially to coastal water nutrient supplies. Groundwater, which brings in over 20 times more nutrients than rain, primarily imports nitrate-nitrogen and DON, while precipitation mainly provides DON, nitrate-nitrogen, and ammonium-nitrogen. Particulate materials in rain have a high cargon: nitrogen ration, and contribute little to enrichment of the nitrogen-limited salt marsh. About half the dissolved inorganic nitrogen brought in by groundwater is exported as PN, thus transforming nitrogen usable by primary producers into a form suitable for such consumers as shellfish. PC exported amounts to 40% of the net annual production of Spartina alterniflora, the dominant marsh plant. (Lynch-Wisconsin)

DEPENDENCE OF LIGHT-SATURATED RATES OF ALGAL PHOTOSYNTHESIS ON INTRACELLULAR CONCENTRATIONS OF PHOSPHORUS,
Minnesota Univ., Minneapolis. Dept. of Ecology and Behavorial Biology.
W. H. Senft.
Limnology and Oceanography, Vol. 23, No. 4, p 709-718, July 1978. 9 fig, 42 ref. ERDA E(11-1)-1820.

Descriptors: *Phosphorus, *Phytoplankton, *Photosynthesis, *Cell quota, *Light, *Plant growth, Chlorophyll, Intracellular nutrient concentration, Model studies, Mathematical models, Nutrients, Cyanophyta, Chlorophyta, Algae, Chlorella pyrenoidosa, Anabaena wisconsinese.

Specific photosynthetic rates of laboratory populations of a cyanophyte (Anabaena cf, wisconsinense) and a chlorophyte (Chlorella pyrenoidosa) at saturating irradiances were dependent on intracellular phosphorus(Q). A hyperbolic model of the form P sub opt=P sub opt=P sub opt-s (1-K sub Q/Q) was used to describe this relationship for

three measures of biomass: cell number, cell volume, and chlorophyll-a. The latter best dit the model. When chlorophyll-a was used as the measure of population size, both the maximal specific rate of photosynthesis (P sub opt-s) and the subsistence cell quota (K sub Q) for Anabaena were much large than for Chlorella. The dramatic differences in the responses of Anabaena and Chlorella to a fixed level of cellular phosphorus suggest that each species may have a characteristic P sub op-s and K sub Q calue, but whether this difference is characteristic of cyanophytes and chlorophytes in general is not known. Data presented here clearly indicate that the photosynthetic efficiency of a chlorophyll unit is not constant, but instead varies with the nutritional state of the algal population. The relationship between photosynthesis and intracellular nutrients is important because the dependence of growth rates on Q observed in laboratory populations probably reflects a more fundamental dependence of photosynthesis on the intracellular nutrients.

KINETICS OF ALGAL TRANSIENT PHOSPHATE UPTAKE AND THE CELL QUOTA CONCEPT,
Wisconsin Univ.-Madison. Dept. of Bacteriology.
E. J. Brown, and R. F. Harris.
Limnology and Oceanography, Vol. 23, No. 1, p 35-40, January 1978. 4 fig, 1 tab, 21 ref. NSF AG-199, BMS76-00761193-69.

Descriptors: *Kinetics, *Absorption, *Phosphates, *Nutrients, *Cell quota, *Phytoplankton, Transient nutrient uptake, Algae, Selenastrum capricornutum, Nostoc, Bacteria, Orthophosphate, Inorganic compounds, Mathematical studies, Limiting factors, Plant growth, Microorganisms.

Dissolved inorganic orthophosphate (P sub i) uptake rates (v) were determined as a function of total cell phosphorous content (Q) in P sub i - perturbed axenic batch cultures of the green alga Selenastrum capricornutum and the blue-green bacterium Nostoc sp. Results showed an inverse relationship between v and Q for both organisms. The findings help relate the cell quota concept of nutrient-limited, steady-state microbial growth kinetics to nutrient uptake kinetics observed in perturbed batch cultures. Continuous-culture growth experiments have shown that one metabolic indicator of microbial growth-rate (mu) may be the cell quota (Q) -- the nutrient content of the organism. Cell quota has also been shown to control transient nutrient uptake rates, at least for growth-limiting nutrients. Low external limiting nutrients concentrations (S), resulting from aquatic microbial uptake, complicates interpretation of the kinetics of transient uptake, and steady-state growth, and has led to complex mathematical relationships among mu, S, and Q. Other factors are maximum growth rate constant (mu sub max), minimum cell nutrient content (k sub Q), maximum nutrient uptake rate constant (V), and half-saturation constants for growth (K sub mu) and uptake (K sub v). The cell quota concept is currently useful for relating microbial growth rate to changes in moderate to high levels of inorganic nutrients that are growth-rate limiting, but it is only an approximation. USE OF FLUORESCENCE MICROSCOPY FOR QUANTIFYING PHYTOPLANKTON, ESPECIALLY FILAMENTOUS BLUE-GREEN ALGAE,
Wisconsin Univ.-Madison. Dept. of Bacteriology.
T. D. Brock.
Limnology and Oceanography, Vol. 23, No. 1, p 158-160, January 1978. 4 fig, 5 ref. NSF DEB77-03906 and ERD COO-2161-35.

Descriptors: *Phytoplankton, *Filamentous algae, *Fluorescence, *Microscopy, Measurement, *Methodology, Staining, Cyanophyta, Bacteria, Lake Mendota(WI), Wisconsin, Lakes, Eutrophication, Research equipment, Algae, Primuline stain, Fluorochromes, Filtration.

Epifluorescence after fluorochrome staining provides a simple and direct means of making phytoplankton on filters, visible, after which they can be quantified using various techniques. Water samples from Lake Mendota (Madison Wisconsin) were stained with fluorochrome primuline yellow (C.I. 49000) and filtered on black membrane filters. The phytoplankton were viewed under wet mount at high magnification (about 300-500x). for filamentous blue-green algae (for which the method is especially useful), Olson's procedure number five was used to make quantitative estimates of filament lengths, in turn used with measurements of diameter to calculate volume of the algae. Olson's procedure consists of: (1) fitting a measuring eyepiece with an ocular grid, (2) counting the number of crosses the filaments make with the grid's horizontal and vertical lines, (3) multiplying the number of crosses by pi/4 (0.786) to yield aggregate lengths of filaments per unit volume of water. Filament volume is then calculated using filament diameter. Samples were stirred prior to filtration to ensure homogeneous settling. The epifluorescence technique not only permits rapid counting with large volumes of water, but does not require an inverted microscope (though a fluorescence attachment is necessary). Bacteria can also be counted with use of a 100x objective. (Lynch-Wisconsin)

SOFT-SHORE MACROBENTHOS ALONG THE SOUTH-WEST COAST OF WALES,
University Coll. of Swansea (Wales). Dept. of Zoology.
R. G. Withers.
Estuarine and Coastal Marine Science, Vol. 5, No. 4, p 467-484, 1977. 1 fig, 2 tab, 51 ref, 3 append.

Descriptors: *Benthis fauna, *Spatial distribution, *Biomass, *Wales, *Beaches, *Intertidal areas, Crustaceans, Polychaetes, Arenicola marina, Cardium edule, Macrobenthos, Shores, Littoral, Milford Haven(United Kingdom), Gower Peninsula(Wales), Carmarthen Bay(Wales), United Kingdom, Distribution, Abundance.

Distribution, zonation and abundance of sand-dwelling fauna was investigated at 15 coastal beach sites between Milford Haven and Swansea Bay in southwestern Wales, United Kingdom. On the basis of geological characteristics and macrofaunal composition the area under study was divided into three regions: (1) Milford haven and the Angle Peninsula; 82) Carmarthen Bay; (3) South Gower and the Swansea Bay. At Milford Haven and the Angle Peninsula sediments consisted mainly of gravel overlain by a thin veneer of silty sand. Such places were colonized by small crustaceans and polychaetes. Where sand was deeper large populations of Arenicola marina and Cardium edule were found. In deep, medium and fine sands of the Carmarthen Bay area species of crustaceans and polychaetes were more varied. Molluscs and the echinoid Echinocardium cordatum were common. South Gower beaches contained well-sorted, medium or fine sand. Where beaches were well sheltered relatively large and diverse macrofauna was present, including bivalves and echinderms. The latter two were not present at the exposed beaches. Sediments at Swansea Bay ranged from clayey, black mud to coarse sand. Each sediment type supported its own characteristic macrofauna with the polychaete Lanice conchilega particularly abundant on the lower shore. Mean biomass levels for each of the regions ranged 0.25 - 13.7 g dry weight/sq m. Higher values were a result of abundance of one or two larger species. (Harris-Wisconsin)

BIOACCUMULATION POTENTIAL AND ACUTE TOXICITY OF SYNTHETIC FUELS EFFLUENTS IN FRESHWATER BIOTA: AZAARENES,
Oak Ridge National Lab., TN.
G. R. Southworth, J. J. Beauchamp, and P. K. Schmieder.
Environmental Science and Technology, Vol. 12, No. 9, p 1062-1066, September 1978. 3 fig, 1 tab, 25 ref. W-7405-eng-26.

Descriptors: *Azaarenes, *Toxicity, *Bioaccumulation, *Fuels, *Daphnia pulex, *Public health, *Carcinogens, *Human diseases, Isoquinoline, Acridine, Benz(a)acridine, Pollutants, Water pollution effects, Lethal limit, Effluents, Zooplankton, Kinetics, Equilibrium, Model studies, Mathematical studies, Mutagens.

Three polycyclic aromatic bases (isoquinoline, acridine, and benz(a)acridine), contained in coal-based synthetic liquid fuels, were concentrated from aqueous solutin by Daphnia pulex about 350-, 30-, and 2.5-fold, respectively. These substances containing a single basic nitrogen within two, three, four, or more aromatic ring systems (azaarenes) belong to a class of compounds which includes known mutagens and carcinogens. Data in this study established that bioaccumulation data were not collected at acutely toxic concentrations, and also indicated that toxicity of these compounds is determined more by differences in delivery of the various toxicants to the organisms than by variation of toxic action within the animal. All data indicate that releases of azaarenes to aquatic ecosystems must be minimized. Bioaccumulation kinetics were described as a first-order approach to equilibrium in a two-compartment model (water and Daphnia) using a two-stage technique to resolve uptake and elimination rates while accounting for decreasing aqueous concentrations. Equilibrium concentration factors increased dramatically with increasing molecular weights within the series of compounds and were also highly correlated with the calculated n-octanol/water partition coefficient. Acute toxicity exhibited the same relationship with changing molecular weight, with 24-hr LC50s of 0.4, 2.9, and 39.9 mg/liter for the three compounds. (Lynch-Wisconsin)

POLYCHLORINATED BIPHENYLS IN COASTAL MARINE ZOOPLANKTON: BIOACCUMULATION BY EQUILIBRIUM PARTITIONING.
Washington Univ., Seattle. Dept. of Oceanography
J. R. Clayton, and N. F. Breitner.
Environmental Science and Technology, Vol 11, No 7, p 676-682, 1977. 5 fig, 8 tab, 43 ref.

Descriptors: *Polychlorinated biphenyls, *Zooplankton, *Puget Sound(WA), *Estuaries, *Bioaccumulation, Equilibrium partitioning, *Marine microorganisms, Water pollution sources, Path of pollutants, Estuarine environments, Dredging, Municipal wasters, Runoff, Bays, Gulfs, Food chains, Lipids, Trophic level

Zooplankton samples from Puget Sound, Washington were studied 1973-1975 to learn about factors that control bioaccumulation of chlorobiphenyls (CB) in lower trophic levels of nearshore ecosystems. Analysis of the data suggest that: (1) lipid-water concentration ratios for CB are constant over a range of spatial and temporal regimes; (2) the residue levels in ambient water and in zooplankton normalized to lipid is important in controlling the degree of accumulation, particularly when lipid constitutes more than 2% of zooplankton fresh weight; (3) lipid-water concentrations for CB are independent of changes in faunal composition; (4) the total reservoir of CB in the water is higher than that in the biota. Results of this study confirm that zooplankton are exposed to CB water concentrations for a period of time sufficiently long to establish equilibrium and that biota possess surface properties favoring establishment of rapid exchange between the internal lipid pools and the water medium. The type of bioaccumulation mechanism observed for CB are also relevant to the spatial and temporal distributions of other environmentally stable toxic organic chemicals in aquatic ecosystems and should be accounted for in environmental impact studies. (Harris-Wisconsin)

INTERSTITAL WATER CHEMISTRY OF ANOXIC LONG ISLAND SOUND SEDIMENTS. 2. NUTRIENT REGENERATION AND PHOSPHATE REMOVAL.

Yale Univ., New Haven, CT. Dept. of Geology and Geophysics.
C. S. Martens, R. A. Berner, and J. K. Rosenfeld.
Limnology and Oceanography, Vol. 23, No. 4, p 605-617, July 1978. 7 fig, 7 tab, 46 ref.

Descriptors: *Nutrient removal, *Phosphates, *Sediments, *Long Island Sound, *Interstices, *Water chemistry, Stoichiometry, Nutrients, Nutrient regeneration, Sulfates, Ammonia, Nitrogen, Phosphorus, Diffusion, Adsorption, Vivianite, Struvite, Chemical precipitation, Mineralization, Ions, Anaerobic conditions.

Nutrient regeneration chemistry in anoxic Long Island Sound sediments was examined through changes in the concentration of dissolved sulfate, ammonia, reactive phosphate, and other chemical species with depth in interstitial waters. In offshore sediments the ratio of mean changes in dissolved sulfate, dissolved ammonia, and dissolved reactive phosphate was -53:4.6:0.37; in shallow harbor sediment the ratio was -53:19:3.3 and changes in ammonia and reactive phosphate ratios were half the offshore ratio. These apparent shoreward changes reflect more rapid deposition and therefore either less preferential stripping of phosphorus and nitrogen from organic material before burial in shallow water harbor sediments, or selective stripping in the heavily bioturbated upper sediment layers offshore, or both. Effects of differential diffusion and adsorption of ammonia and phosphorus are considered. Phosphate concentration maxima in ammonia-and phosphate-rich shallow harbor sediments yield evidence for possible equilibrium with respect to vivianite and struvite. Phosphate removal at depth at two of the coring sites was probably caused by authigenic mineral formation. The three sites in Long Island Sound were chosen to represent sedimentary environments with a range of dissolved sulfate distributions; water depths (mean low tide) were about 7.0, 2.0, and 1.5 m, at the stations. (See also W77-06900) (Lynch-Wisconsin)
W79-02243

BLOOMS OF SURF-ZONE DIATOMS ALONG THE COAST OF THE OLYMPIC PENINSULA, WASHINGTON, IX. FACTORS CONTROLLING THE SEASONAL CYCLE OF NITRATE IN THE SURF AT COPALIS BEACH (1971 THROUGH 1975),
Washington Univ., Seattle. Dept. of Oceanography.
J. Lewin.
Estuarine and Coastal Marine Science, Vol. 7, No. 2, p 173-183, August 1978. 8 fig, 2 tab, 15 ref.

Descriptors: *Diatoms, *Copalis Beach(WA), *Surf, *Eutrophication, *Nitrates, *Limiting factors, Nutrients, Cycling nutrients, Washington, Olympic Peninsula(WA), Surf diatoms, Beaches, Algae, Phytoplankton, Upwelling, Ammonia, Thalassiosira pacifica, Asterionella socialis, Chaetoceros armatum, Nearshore zone, Winds, Discharge(Water), Rivers, Salinity, Seasonal, Pacific Ocean, Oceans, Surface waters, Nitrogen cycle.

Investigation of the seasonal nitrate cycle at Copalis Beach, Olympic Peninsula, Washington, in 1971-75 showed that: (1) annual nitrate depletion in April in upper waters beyond the breaker zone and in the surf zone is due to spring phytoplankton blooms; (2) reintroduction of nitrate into the surf region mid-April to mid-October depends on encroachment of nitrate-rich upwelled oceanic deep water; (3) upwelling can be masked by freshwater stream and river discharge; (4) seasonal species abundance cycles were repeated annually and did not depend on varying nitrate concentrations; and (5) ammonia is an important alternate nitrogen source for surf diatoms, particularly during summer. Water samples were collected from the surf zone and from beyond the breakers triweekly for 24 hrs (sampling every three hrs), and salinity and temperature were measured. 1971 was characterized by greatly reduced coastal upwelling, and 1973 by record low rates of freshwater discharge from coastal rivers. During 1971 nitrate in the surf remained depleted over an extended period (six months), and in 1973 nitrate concentrations in summer surf samples were the highest of the study. In 1974 Thalassiosira pacifica was responsible for almost all the nitrate depletion beyond the breakers. During all summers, cell concentrations of both surf diatom species were reduced, with Asterionella socialis disappearing completely, and Chaetoceros armatum exhibiting physiological stress. (Lynch-Wisconsin)

A BUDGET OF NITROGEN RECYCLING IN NORTH SEA SEDIMENTS OFF THE BELGIAN COAST,
Brussels Univ. (Belgium). Lab. d'Environnement.
G. Billen.
Estuarine and Coastal Marine Science, Vol. 7, No. 2, p 127-146, August 1978. 11 fig, 8 tab, 45 ref.

Descriptors: *North Sea, *Sediments, *Nutrient budgets, *Nitrogen cycle, *Cycling nutrients, *Methodology, Measurement, Belgium, Coasts, Offshore zone, Nearshore zone, Mathematical models, Model studies, Ammonium, Nitrates, Nutrients, Benthic fauna, Benthos, Nitrogen fixing bacteria, Denitrification, Nitrification, Recycling, Interstices, Seas, Sediment-water interfaces, Simulation analysis.

A new method of determining nutrient flux across the sediment-water interface was used to evaluate nitrogen recycling in sediments of the Southern Bight of the North Sea off the Belgium coast. The method is a simplified diagenetic model which uses: (1) vertical profiles of ammonium and nitrate concentrations measured in interstitial water of the sediments, plus (2) direct measurements of ammonification, nitrification, and denitrification rates in the same sediment samples. The model, which simulates the concentration profile in the interstitial water, permits evaluation of ammonium and nitrate fluxes across the sediment-water interface. Such fluxes are important in the whole nitrogen cycle of the ecosystem. Fluxes of ammonium and nitrate from sediments to the water column account for an estimated 62-105% of primary producer requirements in the North Sea coastal zone, and 30-52% in the offshore zone, indicating an important part of nutrient recycling occurs in the benthic phase rather than in the water column, particularly in the coastal zone. Cores for this study were collected 1974-76 in PVC core-liner tubes 30 cm long and seven cm in diameter. Only this manual method left the sediment surface undisturbed. Existing methods for determining nutrient flux have not always been satisfactory, and the importance of recycling of biogenic elements in sediments has often been underestimated. (Lynch-Wisconsin)

SPECIFIC BLUE-GREEN ALGAL CAROTENOIDS IN SEDIMENTS OF ESTHWAITE WATER,
Washington Univ., Seattle. Dept. of Zoology.
M. Griffiths.
Limnology and Oceanography, Vol 23, No. 4, p 777-784, 1978. 3 fig, 18 ref.

Descriptors: *Esthwaite Water(United Kingdom), *Cyanophyta, *Carotenoids, *Myxoxanthophyll, *Oscillaxanthin, *Pigments, *Eutrophication, Lakes, Bioindicators, England, Algae, Sediments, Cores, Oscillatoria, Sedimentation, Nutrients, Water pollution effects, Dating, Age, Fertilizers, Tourism, Water pollution sources.

Comparison of sediment cores and cyanophyte records in 1948-75 for moderately eutrophic Esthwaite Water in the English Lake District permitted correlation of algae in the lake with their pigments in recent sediments. Core profiles of such pigments can indicate appearance of cyanophytes in a lake, and can therefore indirectly predict the onset of eutrophication. The pigment oscillaxanthin is found primarily in some species of Oscillatoria. Myxoxanthophyll is generally considered characteristic of cyanophytes. Two cores five cm in diameter and one m long were taken in the lake's deepest part (13.5-15.0 m deep). Myxoxanthophyll profiles in the two cores showed maxima at 6-7 cm and 14-16 cm and low values in the top five cm and below 17-19 cm. Oscillaxanthin profiles followed a similar pattern, but without the pronounced maxima. Correlation of maximal algal counts in lake water with depths of myxoxanthophyll sediment maxima yielded an annual sedimentation rate of the top 15 cm of 0.6 cm/yr, which agrees well with other methods. Sediment dating with 210Pb gave 1885 for 40 cm. Core profiles suggest that cyanophyte populations were negligible before 1885, increased slowly 1885-1945, and then increased steeply from 1945 to the known maxima of 1948-49 which coincides with tourist influx and increased fertilizer use. Low cyanophyte levels in the last five years may indicate that eutrophication has advanced to where groups other than cyanophytes have become dominant. (Lynch-Wisconsin)

AN EVALUATION OF PHOSPHORUS-CHLOROPHYLL-PHYTOPLANKTON RELATIONSHIPS OF LAKES,
Ontario Ministry of the Environment, Rexdale. Limnology and Toxicity Section.
K. H. Nicholls, and P. J. Dillon.
Internationale Revue der Gesamten Hydrobiologie, Vol 63, No 2, 1978. p 141-154. 6 fig, 3 tab, 54 ref.

Descriptors: *Lakes *Phytoplankton, *Phosphorus, *Chlorophyll, *Trophic level, *Eutrophication, *Estimating equations, *Analytical techniques, *Measurement, Nutrients, Algae, Methodology, Model studies, Mathematical studies, *Reviews, Forecasting, Seasonal, Stratification, Solar radiation, Cell volume, Biomass, Estimating, Carbon, Calories.

Comparison of several phosphorus-chlorophyll-phytoplankton relationships in recent literature reveals considerable variation, only some of which can be attributed to variation in sampling and analytical techniques. Even under consistent sampling and analysis, significant inherent variability in phosphorus-chlorophyll relationships has been documented; cellular algal chlorophyll content ranges over two orders of magnitude (0.1-9.7% of fresh weight). It is concluded that direct microscopic determination is the best estimation for phytoplankton biomass; for studies requiring only an average biomass value for lake trophic state categorization, analysis of a single combined sample is suggested. Carbon and caloric content relate much better than pigment content to algal biomass, but measurements of carbon and calories in lake water usually includes detritus and animals. In a group of interconnected Ontario lakes it is shown that relationships between average total phosphorus and phytoplankton biomass are much better defined if summer average cell volume is used instead of summer average chlorophyll-a. Chlorophyll content of algal cells seems primarily controlled by four factors: (1) average daily incident radiation intensity, (2) species composition, (3) nutrient availability (especially nitrogen), and (4) innate physiology. Total phosphorus may not be the best universal measure of available phosphorus, but refinement would involve rather sophisticated bioassay techniques. (Lynch-Wisconsin)

THE UPTAKE OF DISSOLVED ORGANIC MATTER BY A SMALL SPRING STREAM,
Waterloo Univ. (Ontario). Dept. of Biology.
D. L. Lush, and H. B. N. Hynes.
Hydrobiologia, Vol. 60, No. 3, September 1978, p 271-275. 3 fig, 1 tab, 9 ref.

Descriptors: *Streams, *Organic matter, *Leaves, *Leachate, *Dissolved solids, *Self-purification, *Absorption, *Adsorption, Spring waters, Ouse River(Ontario Canada), Canada, Maple trees, White cedar trees, Acer saccarum, Thuja occidentalis, Tracers, Sodium chloride.

Leachates of dead leaves from sugar maple (Acer saccharum) and eastern white cedar (Thuja occidentalis) were added to a tiny spring-fed headwater of the Ouse River, Ontario, Canada; sampling

at three weirs showed organic matter was removed from solution at remarkedly high rates (0.5-1.1 g/sq m/hr). Data suggest chemical uptake (possibly by adsorption) was responsible for most of the initial removal, with absorption occurring secondarily. The stream rises from a spring boil at the edge of a small pool and flows through a small channel over a substratum of cobbles, fine sand, clay, organic debris, and old logs and branches. The hard water (200 mg/l total hardness) had a pH of 7.8. Background sodium was one mg/l and dissolved organic carbon two mg/l. Three small weirs were installed at 10-11 m intervals to permit sampling and measurement of flow rate. About 12 g of auto-claved leaf leachate with a sodium chloride tracer were added to the pool above the weir one and samples were collected at each weir every 10-15 min for at least 90 min. While the sodium was persistent, 36-86% of the organic matter was lost during the 30 min trip to weir no. three in the first three experiments (October-December 1972). In the fourth experiment, conducted in April 1973 after spring runoff, there was not measurable reduction in organic matter, but leachate had been held for five days at 10C before use and had lost most of its dissolved material. MAXIMUM DEPTH INHABITED BY AQUATIC VASCULAR PLANTS,
Rensselaer Polytechnic Inst. Troy, NY. Dept. of Biology.
R B Sheldon, and C W Boylen.
The American Midland Naturalist, Vol 97, No 1, January 1977, p 248-254, 2 fig, 1 tab, 20 ref.

Descriptors: *Depth, *Lake George(NY), *Rooted aquatic plants, *Light penetration, *Submerged plants, *Transparency, *Oligotrophy, Secchi disc, Macrophytes, Algae, New York, Lakes, Turbidity, Light intensity, Potamogeton, Myriophyllum, Isoetes, Elodea canadensis, Elatine minima, Eriocaulon septangulare, Najas flexilis, Utricularia resupinata, Vallisneria americana, Eutrophication, Nutrients.

Maximum and preferred depth distributions of 28 submerged rooted vascular aquatic plants were studied by divers in oligotrophic Lake George, New York; maximum depth for several species is greater than previously reported. Greatest depth for any one species is 12 m for Elodea canadensis, followed by 10 m for Potamogeton robbinsii, and nine m for P. pusillus, Isoetes macrospora, and Najas flexilis. In most freshwater ecosystems vascular plants are reported limited to less than five m depth, and the previous maximum reported was 10 m in a few lakes. Lake George has exceptionally high water clarity but nutrients are sufficient to support relatively abundant vascular plant growth without encouraging phytoplakton productivity to the extent of reducing availability of light at 10-12 m. Observations were made June 1973- August 1975 at random sites on the periphery of the lake, which is 51 km long by about 2.3 km wide, with a 60 m maximum depth. Water clairty is sufficient to allow 10% of surface light intensity during midsummer to penetrate to 12 m. Secchi disc readings are commonly 6 - 7 m with values as high as 13.5 m recorded. The number of submergent species drops linearly from 38 at one m to one at 12 m. Although it has been stated that hydrophytes may colonize substrates to a depth receiving only 1-4% of surface light intensity, in Lake George depths receiving more than 1% exceed 18 m, while the limit of plant growth is 15 m (the microalga Nitella flexilis). RECENT CHANGES IN PLANKTON COMMUNITIES AND PRESENT TROPHIC STATE OF LAKE STEINSFJORD,
Oslo Univ. (Norway). Dept. of Limnology.
O. K. Skogheim, and S. Rogenrud.
Archiv fur Hydrobiologie, Vol 83, No. 2, p 179-199, June 1978. 12 fig, 4 tab, 32 ref.

Descriptors: *Lake Steinsfjord(Norway), Limnology, *Eutrophication, *Phytoplankton, *Zooplankton, *Trophic level, *Food chains, Mesotrophy, Norway, Lakes, Hydrography, Metabolism, Energy transfer, Primary productivity, Dissolved oxygen, Bioindicators, Food habits, Grazing.

Comparisons of a 1972-73 limnological investigation of Lake Steinsfjord in southeastern Norway with data from earlier studies shows both quantitative and qualitative changes in the planktonic community which indicate increasing eutrophication, though the lake is classified as mesotrophic. Human influence is probably responsible for this enrichment. Despite as years of increased plankton biomass, anaerobic conditions have not developed in the hypolimnion due primarily to highly dynamic energy metabolism in the epilimnion and the general hydrographic features of the lake (including high hypolimnetic temperature and early autumn turnover). In late summer and early autumn 60-80% of primary production is assimilated by nannoplankton-feeding zooplankton. The appearance and increase of several phytoplankton species indicate increasing eutrophication: Oscillatoria rubescens, Aphanizomenon flos-aquae, Asterionella formosa, Tabellaria fenestrata, and Fragilaria crotonensis. The quantative increase in phytoplankton biomass has a correspondingly increased zooplankton, especially in herbivorous species Daphnia galeata and Eudiaptomus gracilis. The appearance of Mesocyclops leuckarti, M. oithonoides, and Daphnia cristata may indicate eutrophication. This paper focuses on composition and biomass of phytoplankton and zooplankton and interrelationships between the two trophic levels (Lynch-Wisconsin)

PARTICULATE AND DISSOLVED ORGANIC MATTER IN A SMALL PARTLY FORESTED ONTARIO STREAM,
Waterloo Univ., (Ontario). Dept. of Biology.
D. L. Lush, and H. B. N. Hynes.
Hydrobiologia, Vol. 60, No. 2, p 177-185, 1978. 8 fig, 19 ref.

Descriptors: *Streams, *Particles, *Organic matter, *Dissolved solids, *Particle size, *Laurel Creek(Ontario), Ontario(Canada), Canada, Carbon, Forest watersheds, Rainfall, Proteins, Carbohydrates, Insects, Invertebrates, Secondary productivity, Chlorophyll, Pigments, Biological communities.

Particulate organic matter (POM) and dissolved organic matter (DOM) fluctuated considerably during a study in the headwaters of Laurel Stream, a small, partially forested, relatively undisturbed stream in Ontario, Canada; rainfall had a strong influence on inputs of organic matter. Five stations were sampled weekly from April thaw until freeze-over in late November 1971. Biota of most streams are greatly dependent on allochthonous organic matter, which fluctuates between DOM (<0.5 micrometer) and POM states. Coarse particles are readily eaten by invertebrates and fine particles are eaten by such specialists as blackfly larvae and net-spinning caddisworms. DOM apparently is not directly eaten, but is rapidly removed from the stream system and presumably becomes available as food. In this study size distribution of POM varied irregularly. Rainfall tended to increase their total quantity as well as their dissolved organic carbon (DOC) concentration; other local factors also affected particle supply. High POM concentration was associated with high amounts of plant pigments, carbohydrate, and protein. Similarly, rain-caused increases in DOC were accompanied by increases in dissolved carbohydrate and protein. Dissolved material behaved more predictably, with a large part rapidly removed from solution. These findings suggest a series of mechanisms by which a woodland stream may trap woodland-produced energy and cycle it through the aquatic system. (Lynch-Wisconsin)

CHANGES IN UNDERSTORY VEGETATION IN CYPRESS DOMES BROUGHT ABOUT BY FIRE AND ADDITION OF SEWAGE,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
K. C. Ewel.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p. 171-189, 1976. 3 fig, 6 tab.

Descriptors: *Swamps, *Aquatic plants, *Burning, *Water pollution effects, Succession, Wetlands, Florida, Marsh plants, Distribution patterns, Waste water disposal.

The effects of application of groundwater and sewage on ecological relationships in burned and unburned cypress domes was monitored over a two-year period since the initial treatments. There were rapid changes in dominace and invader species of understory vegetation for the burned, sewage dome than in any of the others. The duckweed layer is also thicker. The presence of sewage does not seem to have had an overriding influence in determining vegetation; however, the two sewage domes are less similar to one another in species composition than are the two burned domes. The similarity index for the species composition shortly after sewage introduction and one year later was 78 (possible maximum of 86) for the unburned dome, but only 62 for the burned dome, suggesting greater constancy for the flora in the second sewage dome in response to the stress of sewage. This suggests that the presence of nutrient vegetation at the time of sewage introduction has damped the kinds of changes in the unburned dome. (See also W79-02256) (Steiner-Mass)

UPTAKE AND DISTRIBUTION OF PHOSPHORUS IN THE UNDERSTORY OF CYPRESS DOMES,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands
G. S Deghi
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p. 193-196, 1976.

Descriptors: *Swamps, *Marsh plants, *Phosphorus, Wetlands, Florida, Nutrients, Sediments

From field studies using radioacitive phosphorus, values for plant uptake of phosphorus and incorportation of phosphorus into the sediments and detritus was determined. Ion uptake in duckweed and Utricularia is ten to one hundred times greater than in the two emergent species, Woodwardia and Saururus. Radioactivity of rinsed sediment samples and filtrates was similar to background counts. The upper 10 cm of the organic sediments has few exchange sites and the P32 becoming incorportated into the sediment is absorbed at a greater depth. (See also w79-02256) Steiner-Mass)

AIR EMISSIONS FROM CYPRESS SWAMPS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Science; and Florida Univ., Gainesville. Center for Wetlands.
A. A. Linero.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 269-294, 1976. 2 fig, 4 tab, 7 ref, 3 append.

Descriptors: *Swamps, *Water pollution effects, *Gases, Wetlands, Florida, Waste water disposal, Methane.

This study was undertaken to determine the types and quantities of gases being emitted from a sewage-fed cypress dome and to compare these with emissions taken from a control dome. Data from the sewage-fed dome indicates that reactions occur characteristic of the anaerobic digestion of organic matter by bacteria which exist in the water and/or sediments. These reactions account for the presence of carbon dioxide, methane, and hydrogen sulfide. While no gas was evolved and collected from the natural dome, it was concluded that similar processes do occur in the sediments. The method of floating collectors is useful in directly determining emissions of soluble gases such as methane. The method is also useful in determining equilibrium vapor pressures of soluble components such as sulfur dioxide and carbon dioxide. From equilibrium vapor pressure data emission factors can be calculated from transport phenomena calculations. The method is not useful for determining nitrogen and oxygen emissions since the natural tendency is the equilibrium between partial pressures in the atmosphere, the vials, and the liquid phase. THE RESPONSE OF BENTHIC INVERTEBRATE POPULATIONS TO SEWAGE ADDITION,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences; and Florida Univ., Gainesville. Center for Wetlands.
R. S. Brightman, and J. L. Fox.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 295-308, 1976. 2 fig, 6 tab, 1 ref.

Descriptors: *Swamps, *Water pollution effects, *Invertebrates, *Distribution patterns, *Bioindicators, Wetlands, Florida, Waste water disposal, Aquatic animals, Ecological distribution, Water analysis, Water quality.

A decrease in invertebrate diversity observed in cypress domes used to dispose of secondarily treated sewage can be interpreted as indicating an increase in stress. The major form of stress was increased organic material causing oxygen depletion. As organisms died off, the species composition shifted toward those organisms able to tolerate the low oxygen levels. These tolerant organisms became more abundant because of the elimination of their competitors and predators. This caused an invertebrate assemblage dominated by a few species containing many individuals, by definition, low diversity. More meaningful than a single idea was the spatial variation in the sewage domes. The characteristics of the sewage dome centers were those of heavily polluted waters. These characteristics became increasingly indicative of cleaner water as distance from the sewage dome centers increased. The cypress domes, acting as natural treatment systems, improved the water quality as it moved from the center. The response of the invertebrates to the sewage effluent may be useful in determining when it is time to stop loading a specific dome in a system of alternative sites. Invertebrates may also be useful in determining proper loading rates, avoiding the alteration of sites altogether. (See also W79-02256) (Steiner-Mass)

COLIFORM MONITORING OF WATERS ASSOCIATED WITH THE CYPRESS DOME PROJECT,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. Allinson, and J. Fox.
In: Third Annual Report on Cypess Wetlands, Florida University, Center for Wetlands, Gainesville, p 309-320, 1976. 3 fig, 4 tab.

Descriptors: *Swamps, *Water pollution effects, Wetlands, Florida, Waste water disposal, Bacteria, Sewage.

Cypress domes appear to be effective in preventing fecal coliforms from percolating through the soil to the groundwater. Overflow of the cypress domes used for dumping secondarily treated sewage appears to be the major cause of infilration of coliforms into shallow groundwater. Coliform numbers are highest near the inflow of the sewage effluent and decrease with distance toward the edges. (See also W79-02256)(Steiner-Mass)

WATER QUALITY OF CYPRESS DOMES: ROUTINE SAMPLING PROGRAM,
Florida Univ., Gainesville. Dept. of Environmental Engineering Scientific; and Florida Univ., Gainesville. Center for Wetlands.
F. E. Dierberg, and P. L. Brezonik.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 337-371, 1976. 12 fig, 5 tab, 5 ref.

Descriptors: *Swamps, *Water pollution effcts, *Biochemical oxygen demand, Wetlands, Florida, Waste water disposa, Sewage, Dissolved oxygen, Nutrients.

Surface water quality in cypress domes receiving secondarily treated sewage consistently exceeded the level for Biochemical Oxygen Demand (BOD), total P, and total N recommended in the effluent waters from tertiary sewage treatment plants by current State of Florida Standards. The capability of the cypress domes to reduce and/or remove nutrients and oxidizable organics in the sewage therefore does not compare to that of an advanced sewage treatment plant. At the present sewage application rates of one inch per week, surface water quality parameters affected adversely include dissolved oxygen, BOD, sulfide, and nutrients, the levels of which support large standing crops of aquatic angiosperms. The soft, acid water normally found in cypress domes has been altered to a neutral, moderately-hard condition. There are significant seasonal and spatial variations in the levels of chemical parameters. (See also W79-02256)(Steiner-Mass)

DENITRIFICATION AND SURFACE RUNOFF IN THE EXPERIMENTAL DOMES: CYPRESS WETLANDS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences; and Florida Univ., Gainesville. Centre for Wetlands.
F. E. Dierborg, and P. Brezonik.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 383-404, 1976. 2 fig, 6 tab, 2 ref.

Descriptors: *Swamps, *Water pollution effects, *Nutrients, *Wetlands, Florida, Waste water disposal, Sewage, Phosphorus, Nitrogen.

Denitrification occurs to only a limited extent in cypress domes receiving secondarily treated sewage. The most liberal calculation suggests a maximum of only 11% of the total N pumped in could be lost via denitrification. Nutrients entering the domes via surface runoff are of minor importance compared to the nutrient loading from the sewage. Annual total N and P loading from surface runoff contributed only 3-6% and 1-2%, respectively, compared to the sewage. Maximum concentrations for nitrogen species were found to occur at the initial onset of surface runoff and to decrease with time. (See also W79-02256) (Steiner-Mass)

RATES OF GROWTH AND NUTRIENT CONCENTRATIONS OF TREES IN CYPRESS DOMES,
Florida Univ., Gainesville. School of Forest Resources and Conservation.
D. M. Post, P. A. Straub, and W. Smith.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 422-446, 1976. 22 tab.

Descriptors: *Swamps, *Water pollution effects, *Plant growth, *Nutrients, Wetlands, Florida, Waste water disposal, Sewage, Trees, Growth rates, Phosphorus, Nitrogen.

Concentrations of nitrogen and phosphorus have not increased appreciably in trees growing in domes receiving secondarily treated sewage. Phosphorus did show more of an increase than did nitrogen, however. Core samples for Nyssa biflora and Pinus elliotti indicate that these species may be more sensitive to phosphorus increases than the cypress, Taxodium distichum. Phosphorus levels in the cores from cypress trees in the sewage domes are twice as high as the levels in cores on the natural control dome. Domes receiving sewage or having been burnt previously had significantly greater tree growth than did a control dome. (See also W79-02256)(Steiner-Mass)
W79-02271

GROWTH RATES OF SEEDLINGS PLANTED IN CYPRESS DOMES,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
G. S. Deghi.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 453-469, 1976. 9 fig, 1 append.

Descriptors: *Swamps, *Water pollution effects, *Plant growth, Wetlands, Florida, Waste water disposa, Sewage, Trees, Growth rates, Vegetation establishment.

Three species of seedlings, tupelo, bald cypress, and pond cypress, responded differently to the addition of secondarily treated sewage effluents. Input of sewage seems to be detrimental to the growth of tupelo and young bald cypress seedlings. This is possibly related to stresses caused by an anaerobic environment. Older bald cypress seedlings (greater than six months) in the sewage dome exhibited similar growth patterns as control dome seedlings. The increased nutrient input in the sewage domes seems to stimulate the long-term growth of pond cypress seedlings. (See also W79-02256)(Steiner-Mass)

EFFECT OF SEWAGE EFFLUENT IN CYPRESS PONDS ON SURROUNDING SOIL MOISTURE AND NUTRIENT CONTENT AND ON GROWTH OF PINE TREES (SUMMARY OF MS THESIS),
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
P. E. Okorie.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 470-503, 1976. 7 fig, 2 tab, 58 ref.

Descriptors: *Swamps, *Water pollution effects, *Plant growth, *Soil moisture, Wetlands, Florida, Waste water disposal, Sewage, Trees, Growth rates, Nutrients, Hydrogen ion concentration.

The surface soil moisture content was highest near the pond and decreased with distance from the pond margins. At a depth of 30.5 cm, the moisture content of the soil at the sewage dome was significantly higher than the control at a distance of 20 m from the pond edge. The pH of the soil at a depth of 80 to 100 cm was higher for the control by a range of 0.35 at 20 m to 1.3 at 5 m from the edge of the pond, indicating the modifying effect the treated pond could have on the pH of the surrounding soils. Results of foliar analysis showed no profound

effect on nutrients levels due to effluent application. Nevertheless, amounts of N, K, and Mg were higher at the flooded edge of the pond than farther out in the drier areas. The fact that trees near the pond with their roots in the waterlogged soils were growing at almost the same rate as those on drier lands farther from the edge indicated that additional nutrients from the effluent raised the nutrient levels of the soil around the roots thus enabling them to withstand effectively the deleterious effects of waterlogging and high pH. (See also W79-02256)(Steiner-Mass)
W79-02273

EFFECT OF SEWAGE EFFLUENT IN CYPRESS PONDS ON GROWTH OF SURROUNDING PINE SEEDLINGS AND TREES,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
P. E. Okorie.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 504-509, 1976. 3 fig, 1 ref.

Descriptors: *Swamps, *Water pollution effects, *Plant growth, *Pine trees, Wetlands, Florida, Waste water disposal, Sewage, Trees, Growth rates.

In both cypress domes receiving secondarily treated wastes and control domes, growth response still appeared to be related to varying drainage conditions of the soil. The seedlings near the treated dome had almost the same height increments as those farther away. Very likely, the nutrients in the effluent had started to move out from the dome This coupled with the modification of the soil pH could be responsible for narrowing the margin of difference between height increments of the seedlings near the pond and those far away from it. Height increments were higher for trees near the dome than those farther away. Possibly, the trees near the dome benefited from the nutrients and water in the effluent, particularly during a dry season. (See also W79-02256)(Steiner-Mass)

SEDIMENTATION RATES: CYPRESS DOMES,
Florida Univ., Gainesville. Dept. of Soil Science.
J. E. Struble, and D. A. Graetz.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 510-515, 1976. 5 fig.

Descriptors: *Swamps, *Water pollution effects, *Sedimentation rates, Wetlands, Florida, Waste water disposal, Sewage, Detritus.

Field data were collected on the rate of sedimentation in two cypress domes receiving sewage effluent and one receiving groundwater. For each dome the sedimentation rate is greater for the traps that are closer to the center. This may be due to the fact that the discharge pipes are near the center in each of the domes. The traps that are within 10 meters of the center may be picking up material that gets resuspended during effluent or water discharge to the dome. The three domes show a difference in sedimentation rates. In sewage dome 1, the average rates range from 5.07 to 18.85 g/sq m/day as compared to 5.23 to 10.77 g/sq m/day for sewage dome 2, and 6.14 to 8.3 g/sq m/day for the groundwater dome. In the sewage domes the majority of the material collected is very flocculant; they also have duckweed which settled to the bottom. The material in the groundwater dome consists more of litter that has fallen. (See also W79-02256) (Steiner-Mass)

THE EFFECTS OF PERTURBATION ON CYPRESS DOME ANIMAL COMMUNITIES,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences; and Florida Univ., Gainesville. Center for Wetlands.
W. Jetter, and L. D. Harris.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 577-653, 1976. 38 fig, 5 tab, 17 ref, 3 append.

Descriptors: *Swamps, *Water pollution effects, *Aquatic animals, *Aquatic habitats, Wetlands, Florida, Waste water disposal, Sewage, Aquatic insects, Diptera, Frogs, Amphibians, Wildlife, Birds, Water birds, Mammals, Freshwater fish, Invertebrates, Small animals(Mammals).

Important structural and functional changes occur in the consumer communities of cypress domes receiving treated sewage. Shifts in the type and amounts of food available have caused populations of key groups of animals to be altered. With the formation of a floating mat of organic material on the pond surface, there is a massive shift from aquatic detritivores which complete their life cycle within and upon the organic mat. This attracts numerous frogs to the site but tadpole development is prevented because of the anaerobic conditions. The frog population consists totally of migrants from neighboring, untreated domes. Many fish and aquatic invertebrate species are also eliminated because of the anaerobic conditions. Birds feeding on these aquatic organisms decrease in numbers while species feeding on the organic mat detritivores increase. In addition to shifts in total numbers and biomass, marked changes occurred in the spatial distribution of the birds within the sewage domes. Sewage treatment probably had a positive effect on small mammal populations because of more vigorous and nutritious vegetation growth. (See also W79-02256) (Steiner-Mass)

COMPARISON OF FALL BIRDS PRESENT IN A NATURAL CYPRESS DOME, AND THE ADJACENT PINE PLANTATION,
Florida Univ., Gainesville. School of Forest Resources and Conservation; and Florida Univ., Gainesville. Center for Wetlands.
A. Ramsay
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 654-670, 1976. 5 tab, 21 ref.

Descriptors: *Swamps, *Water pollution effects, *Song birds, Wetlands, Florida, Waste water disposal, Birds

The number of species detected varied from a low of eight in the natural dome center to a high of fifteen in the sewage dome ecotone. The mean species number observed in the sewage dome ecotone was significantly different from the other sampled areas except for the pine plantation. The value obtained from the plantation was significantly different only from the natural dome ecotone. Mean diversity shows the same relationship: no significant differences were found in equitability (evenness) values between study areas; therefore, differences in diversity can be attributed to differences in species richness. The highest avian diversity was found in the sewage dome ecotone with the pine plantation second. The natural cypress dome ecotone showed the lowest diversity. Most birds observed were common residents or common winter visitors in this area. The phoebe, white-eyed vireo, and swamp sparrow were seen in association with the sewage dome, while robins were detected in conjunction with the natural dome and plantation. Both study domes showed a similarity index of approximately 65% when compared to their respective ecotones. The two dome centers showed a similarity of 44%, while the value between ecotones was 48%. Descriptors: *Burntside Lake(MN), *Shagawa Lake(MN), *Trophic level, *Paleolimnology, *Eutrophication, *Limnology, Lakes, Minnesota, Oligotrophy, Diatoms, Primary productivity, Algae, Phytoplankton, Palynology, Lake restoration, Water pollution effects, Geology, Nutrients.

Paleolimnological studies of two adjacent lakes in northeastern Minnesota show that Burntside Lake has been less productive than Shagawa Lake for at least 2,000 years, long before the latter became enriched after 1886 with the arrival of white settlers. Causes for the natural difference in productivity are not clearly known, as both lakes occur within the same vegetation type and share much of their water. Differences may be due to relative size of drainage area and variations in bedrock geology. While settlement around Shagawa Lake has resulted in nutrient inputs which increased productivity and caused massive cyanophyte blooms, Burntside Lake has been spared intensive eutrophication. However, the diatom record of Burntside Lake indicates that nutrients derived from shoreside cabins and construction have been increasing the lake's productivity. Results suggest that paleolimnological studies may provide better comparative information for lake rehabilitation programs than do biological and chemical analyses of contemporary unpolluted water bodies. Shagawa Lake occupies a terrane of easily weathered metasedimentary and metavolcanic rocks; tributaries which cross this terrane bring dissolved ions and nutrients to the lake. Some groundwater probably enters Shagawa Lake along fracture zones as well, and can also carry nutrients. Burntside Lake lies in a dominantly granitic terrane whose rocks and minerals are slow to yield necessary ions for algal growth to the water. (Lynch-Wisconsin)

AQUATIC DISPOSAL FIELD INVESTIGATIONS DUWAMISH WATERWAY DISPOSAL SITE PUGET SOUND, WASHINGTON, EVALUATIVE SUMMARY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
H. E. Tatem, and J. H. Johnson.
Technical Report D-77-24, June 1978. 77 p, 11 tab, 9 fig, 26 ref, append.

Descriptors: *Washington, *Pollutants, *Aquatic environment, *Environmental effects, *Waste disposal sites, *Dredged material disposal, *Duwamish waterway(Wash), *Puget Sound(Wash).

A multidisciplinary approach studied physical, chemical, and biological effects of disposal of contaminated dredged material from the Duwamish River on a deepwater disposal site located in Elliott Bay. Observation of individual disposal events indicated that the sediment left the split-hull barges as a well-defined slug and reached the bottom in approximatedly 25 sec. A mound of dredged material 2.2 m high was created near the center of disposal site. No physical or chemical evidence indicated any of the material reached two reference sites located waste and west of the disposal site. Chemical analyses of in situ river sediment revealed concentrations of total sulfides and PCB's and interstitial water ammonia significantly higher than sediments from the disposal or reference sites. The disposal operation resulted in a rapid pulse of low levels of suspended solids in the water column which lasted less than 30 min. Increased levels of dissolved manganese and total PCB's in the water column were associated with the short-term increase in suspended particulate matter. Chemical analyses of animal tissues collected at the disposal and reference sites indicated the disposal operation did not result in higher levels of mercury a chromium in test animals. (WES)

TOXICITY, BOD, AND COLOR OF EFFLUENTS FROM NOVEL BLEACHING PROCESSES,
Pulp and Paper Research Inst. of Canada, Pointe Claire (Quebec).
A. Wong, M. Le Bourhis, R. Wostradowski, and S. Prahacs.
Pulp and Paper Canada, Vol. 79, No. 7, p 41-47, (T235-T241), July, 1978. 2 appendices, 6 fig, 26 ref, 8 tab.

Descriptors: *Bleaching wastes, *Toxicity, *Biochemical oxygen demand, *Color, Fish, Wastes, Industrial wastes, Pulp and paper industry, Effluents, Pulp wastes, Aquatic animals, Hardwood, Softwood, Pollutants, Chemical oxygen demand, Oxygen, Chlorine, Gases, Chlorination, Ozone, Kraft pulps, Bleaching, Chlorine dioxide, Hydrogen peroxide.

Fish toxicity data were obtained at the Pulp and Paper Research Institute of Canada for effluents from five novel high-consistency bleaching sequences for hardwood and softwood kraft pulps, viz., D(g)/P/D(g), C(g)/E(x)/D(g), O/C(g)/E(x), O/C/E, and O/D(g)/E(x), where g denotes treatment with the reagent in its gaseous form and E(x) is rapid-press caustic extraction. The O/D(g)/E(x) sequence produced the least toxic combined effluent which contained the smallest quantities of BOD, COD, and color. The lower residual chlorine concentrations of the C(g) as compared to the C effluents resulted in a lower toxicity. The calculated toxicities of E(x) effluents were less than those of E effluents at estimated steady-state conditions of multiple recycling of wash filtrates. This may be due to the use of C(g) instead of conventional C in the preceding bleaching stage. For a given pulp, both extraction methods produced similar quantities of BOD, COD, and color. Oxygen bleaching, followed by conventional chlorination and extraction treatments, does not reduce the toxicity but does reduce the BOD, COD, and color of the combined effluents. The color of combined effluents from bleaching sequences involving the use of D (chlorine dioxide) and/or P (peroxide) was lower than that of other combined effluents. (Swichtenberg-IPC)

FISH TEST WITH GOLDEN ORFE -- TESTING THE TOXICITY OF MATTER CONTAINED IN WATER (FISCHTEST MIT GOLDORFEN -- PRUEFUNG DER TOXIZITAET VON WASSERINHALTSSTOFFEN),
Technische Univ., Darmstadt (West Germany). Wasser und Abwasserforschungstelle.
L. Gottsching, and A. Geller.
Das Papier, Vol. 32, No. 5, p 201-208, May, 1978. 3 fig, 2 illus, 21 ref, 3 tab. English summary.

Descriptors: *Pulp wastes, *Toxicity, *Bioassay, *Fish, Water analysis, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Foreign countries, Suspended solids, Chemical oxygen demand, Mercury, Cadmium, Legal aspects, Europe, Legislation, Ammonium compounds, Sulfonates, Aquatic animals, Furfural, Golden orfe, False goldfish(Leuciscus idus melanotus), Guppies, West Germany.

According to the West Germany Waste Water Discharge Tax Law in force since January 1978, the harmfulness of water is determined by the following parameters: suspended solids, COD, mercury and cadmium contents, and toxicity to fish. The toxicity tests are compared for Germany, Great Britain, France, Italy, and the United States. Acute toxicity of water to fish is determined by dilution sequences. In Germany there is a test for guppies and a test for the golden orfe or false goldfish (Leuciscus idus melanotus), the latter being the subject of this study. The legal basis, limits of the test, and problems for the pulp and paper industry are discussed. The resuls of interlaboratory tests by a subcommittee of the German Committee on Detergents are reported, with emphasis on results relevant to the pulp and paper industry. Some toxic control substances of interest are quaternary ammonium compounds, sodium dodecyl sulfonate, and furfural. Basic problems of bioassay procedures are also treated. (Ward-IPC)

THE RELEASE OF PLANT NUTRIENTS FROM REED BORDERS AND ITS TRANSPORT INTO THE OPEN WATERS OF THE BODENSEE-UNTERSEE, (IN GERMAN),
V. R. Schroder.
Archiv Hydrogiologie, Vol. 71(2), p 145-158. January, 1973. 5 fig, 3 tab, 8 ref.

Descriptors: *Wetlands, *Cycling nutrients, *Eutrophication, Nutrients, Phosphorus, Lakes, Marsh plants, Currents(Water).

The effect that reed borders have on eutrophication was investigated for a nutrient-rich and artificially eutrophied lake. In situ experiments provided the basis for calculating the daily amounts of phosphorus and nitrogen compounds that were released from the reeds. Measurements of the direction and velocity of the water current in the reed area indicated that the material released was carried to the lake by a bottom current while another current flows near the surface in the opposite direction. In the case of the Bodensee-Untersee, the littoral zone, which is partially inhabited by reeds, accounts for about 10% of the total phosphorus load. Owing to the seasonal fluctuations in the lake level and the resulting flooding of the littoral zone, a nutrient input occurs. The maximum of this nutrient input takes place when the phosphate concentration in the lake is at a minimum. Consequently, the eutrophying effect of the littoral zone can be importance for the total balance. (Steiner-Mass)

Descriptors: *Coastal marshes, *Nitrates, Wetlands, Marshes, Swamps, Muck soils, Nitrogen cycle, Fertilizer, Nutrients, *Dissolved oxygen, *Oxidation-reduction potential, *Nutrient removal.

Flooded and marsh soils in the flooded swamp and marsh soils in the interior swamp and coastal areas of Louisiana have a high capacity for removing NO sub 3 (-). Nitrate added either to the shallow floodwater or mixed in the soil rapidly disappeared under laboratory conditions. Nitrate loss does not take place in the floodwater, but is dependent on the NO sub 3(-) moving downward into the anaerobic soil layer. The NO sub 3(-) removal capacity is much greater than is required to handle any amount of No sub 3(-) -N that is likely to be present in these areas, either from oxidation of ammonium that has been released from organic matter or from NO sub 3(-) derived from local runoff from adjacent agricultural areas. Nitrate loss does not appear to be inhibited by the presence of a small amount of molecular O sub 2 in flooded soils. (Steiner-Mass)

EFFECTS OF AN ORGANIC ARSENICAL HERBICIDE ON A SALT MARSH ECOSYSTEM,
Auburn Univ., AL. Dept. of Biology; and Auburn Univ., AL. Dept. of Microbiology.
A. C. Edwards, and D. E. Davis.
Journal of Environmental Quality, Vol. 4, No. 2, p 215-219, 1975. 5 tab, 15 ref.

Descriptors: *Salt marshes, *Marsh plants, *Marine animals, *Arsenicals(Pesticides), Pesticide residues, Wetlands, Mussels, Arsenic compounds, Herbicides, Aquatic weed control, Pesticides, Bioassay, Hazards, Soil contamination, Water pollution sources.

The effects were investigated of single and repeat applications of monosodium methanearsonate on the standing crops of Spartina alterniflora (a marsh grass), Litorina irrorata (a periwinkle), and Modiolus demissus (a rib mussel). Post-treatment sampling revealed no alteration of the density of S. alterniflora; 30 applications of 10,000 ppm decreased the dry weight of living S. alterniflora, flowering shoot production was reduced by 30 applications of 10,000 or 1,000 ppm; one application of 90,000 ppm and 30 applications of 10,000 or 1,000 ppm increased the percentages of dead and necrotic tissue on living shoots; and the Littorina

population was decreased by 30 applications of 10,000 ppm. Survival of the rib mussel was not affected by flooding with 100 ppm in sea water. Arsenic levels in Spartina and soil samples were significantly increased by 30 foliar applications of 10,000 ppm or flooding 30 times with 100 ppm. Arsenic levels in Littorina and Modiolus also increased immediately following treatment. (Steiner-Mass)

NUTRIENTS IN SUBSURFACE AND RUNOFF WATERS OF THE HOLLAND MARSH, ONTARIO,
Ontario Ministry of the Environment, Toronto.
K. H. Nicholls, and H. R. MacCrimmon.
Journal of Environmental Quality, Vol. 3, No. 1, p 31-35, 1974. 3 fig, 2 tab, 18 ref.

Descriptors: *Marshes, *Land reclamation, *Nutrient cycling, Wetlands, Freshwater marshes, Nutrients, Nitrogen, Phosphorus, Marsh management, Drainage, Leaching, Fertilizers.

The combined effects of fertilization, drainage, and, hence, oxidizing and nitrifying conditions yield about 4 to 5 times more P and some 40 to 50 more nitrate-N in runoff water from cultivated over uncultivated marsh plots. Furthermore, the importance of overwinter leaching of P from frozen marsh vegetation has been indicated. The total P and nitrate-N lost in drainage water from the cultivated marsh plot are amounts which fall within the yearly range reported for several agricultural lands. The significance of the loading from the Holland Marsh, however, is that it is all released during a 5 to 6 week pumping period and that more than 90% of the P is in the soluble, reactive, orthophosphate form and is, therefore, available for algae and aquatic plant growth. The contribution of nutrients to the lower main channel of the marsh by the base flow of subsurface water from the fertilized and cultivated areas of marsh is considered negligible during the growing season. The reasons are the mean inorganic N and P concentrations in the subsurface water during the growing season are low and subsurface drainage presumably does not occur except when the pumps are draining the ditches in the early spring. Descriptors: *Fish reproduction, *Cytological studies, *Mode of action, *Rainbow trout, *Aroclor 1254, *Polychlorinated biphenyls, Pathology, Bioassay, Water pollution effects, Laboratory tests, Trout, Salmonids, *Carp, Reproduction, Fish physiology, Electron microscopy, *Histological studies, Liver, Gonads.

Sexually mature male and female rainbow trout (Salmo gaidneri) and carp (Cyprinus carpio) were injected intraperitoneally with Aroclor 1254 (25 mg/kg body weight in 1 ml of arachis oil) once weekly for four weeks. Arachis oil was used as the control. At the end of the fourth week, samples of the liver, testis and ovary were taken from treated and control fish and examined by light and electron microscopy. The light microscope study indicated that there was general vacuolation of the hepatocytes of trout but not carp; fragmentation of the developing oocytes but no observable changes in the testis. Electron microscopy study showed that there was enlargement of the rough endoplasmic reticulum of the hepatocytes, some damage to spermatozoa and proliferation of the smooth endoplasmic reticulum of the oocytes. Aroclor 1254 was administered intraperitoneally (25 mg/kg body weight in 1 ml of arachis oil) at weekly intervals for 4 weeks to trout and carp; arachis oil was used as the control. Activities of hepatic microsomal enzymes were measured in both species; cytochrome P450 and microsomal protein contents were also determined. The changes in the levels of androgens, oestrogens and corticoid hormones were measured in the circulating blood of control and treated groups at weekly intervals. The blood was obtained by cardiac puncture. Results indicated (a) a significant increase in the activities of all the enzymes measured except 1-leucyl-beta-naphthylamide splitting enzyme, (b) cytochrome P450 and microsomal protein contents were increased in trout, but not in carp, (c) a significant reduction in the plasma levels of androgens, oestrogens and corticoids in the treated groups, particularly at the end of the fourth week and (d) there was a correlation between increased enzyme activities and a decrease in plasma hormone levels. (EIS-Katz)

STUDIES OF THE ECOLOGY OF FISH POPULATIONS IN THE RYE MEADS SEWAGE EFFLUENT LAGOONS,
Chelsea Coll., London (England). Dept. of Pharmacology; and Chelsea Coll., London (England). Dept. of Zoology.
R. W. G. White, and W. P. Williams
Journal of Fish Biology, Vol 13, p 379-400, 1978. 12 fig, 9 tab, 49 ref.

Descriptors: *Fish populations, *Sewage lagoons, *Sewage effluents, *Growth rates, *Perches, *Fish reproduction, Biological communities environmental effects, Sewage, Freshwater fish populations, Biological communities, Aquatic populations, Nutrients, Sewage disposal, Sewage treatment, Lagoons, Productivity seasonal, On-site investigations, Roach, Chubs, Rutilus, Perca, Leuciscus.

The ecology of populations of roach, chub and perch in shallow lagoons forming part of a sewage works was studied over a period of two years. The fish were netted, identified, measured and scales taken for ageing, except in the case of perch of which a limited number were killed and their opercular bones collected. The chub and perch grew faster than those from other waters and the growth rate of the roach equalled that of the best European populations. Breeding success was irregular, particularly with the chub, and a relatively low population density and the high potential productivity of the lagoons could explain the rapid growth rate. (EIS-Katz)

THERMAL TOLERANCE AND PREFERENCE OF THE INDIAN CATFISH HETEROPNEUSTES FOSSILIS,
Delhi Univ. (India). Dept. of Zoology.
S. Vasal, and B. Sundararaj.
Environment Biology of Fish, Vol. 3, No. 3, p 309-315, 1978. 2 tab, 5 fig, 29 ref.

Descriptors: *Water temperature, Environmrntal effects, *Catfish, *Fish behavior, *Letal limit, Freshwater fish, Laboratory tests, Seasonal, Heated water, Temperature, Resistance, Methodology, *Indian Catfish, Hetropneustes, *Heterothermal environments, *Thermal tolerance, Thermal preference.

The catfish Heteropneustes fossils tolerates a wide range of temperatures. The minimal (7.9C) and maximal (39.8C) lethal temperature values obtained during summer are higher than the minimal (4C) and maximal (37.7C) lethal temperature values obtained during water; gradual heating or cooling versus abrupt exposure to various temperatures did not produce significant differences. Catfish acclimated to temperatures of 28 degrees (summer) or 16 degree C (winter) finally selected temperatures ranging from 31.3 degrees to 32 degrees C, when placed in a temperature gradient of 15 degrees to 35 degrees C. Catfish avoid temperatures below 25 degrees C regardless of seasonal acclimatization. (EIS-Katz)

Descriptors: *Carp, *Plankton, *Aquiculture, *Aquatic populations, *Productivity, Fisheries, Fish stocking, Phytoplankton, Zooplankton, On-site data collections, Ponds, Fish management farm ponds, *Eutrophication, Fish food organisms, Cyanophyta, Hypophthalmichthys.

No severe changes take place in the plankton of highly eutrophic nonstratified water bodies under the climatic conditions of the GDR provided that stocking rates do not exceed 1,000 Si3/ha. In such waters it is possible to get an additional yield of 200 to 300 kg/ha with a stocking rate of 1,000 Si3/ha. This yield is based mostly on microphytoplankton and finer zooplankton, both fractions luxuriating with enhanced trophy. Stocking rates of the order of 10,000 Si3/ha allow selective overexploitation of microphytoplankton including bluegreens and nearly all zooplankton. This may be of interest to fishery management (also because of yields of up to 1 t/ha) as well as to water technology. (EIS-Katz)

THE CRUSTACEAN ZOOPLANKTON OF GRASMERE BEFORE AND AFTER A CHANGE IN SEWAGE EFFLUENT TREATMENT,
Freshwater Biological Association, Ambleside, (England).
W. J. P. Smyly
Internationale Revue Gesamten Hydrobiologie, Vol. 63, No. 3, p 389-403, 1978. 1 tab, 7 fig, 20 ref.

Descriptors: *Crustaceans, *Zooplankton, *Sewage effluents, *Plankton, *Sewage treatment, *Aquatic populations, Daphnia, On-site investigations, Biological communities, Water pollution effects, Oxygen, Domestic wastes, Water pollution sources, Copepods, Mollusks, Rotifers, Dissolved oxygen, Water quality, Seasonal, *Lake Grasmere(England).

The limnetic crustaceans of Grasmere, a small lake in the English Lake District, were studied from February 1969 to December 1970 (23 months) and from January to December 1975. These observations were made before and after a change in sewage effluent treatment effected in May 1971. Planktonic species, except for one cladoceran, were more abundant in the second that the first period, while hypolimnetic and profundal forms either became less abundant or modified their lifestyle in conjunction with a developing hypolimnetic oxygen-deficit. (EIS-Katz)

POSSIBLE TOXIC EFFECTS OF THE MARINE BLUE-GREEN ALGA, SPIRULINA SUBSALSA, ON THE BLUE SHRIMP, PENAEUS STYLIROSTRIS,
Arizona Univ., Tucson. Environmental Research Lab.
D. V. Lightner.
Journal of Invertebrate Pathology, Vol. 32, p 139-150, 1978. 9 fig, 1 tab, 19 ref.

Descriptors: *Aquiculture, *Shrimp, *Commercial shellfish, *Animal diseases, *Cyanophyta, *Toxicity, *Marine algae, Eutrophication, Microbiology, Animal pathology, Microorganisms, Marine bacteria infection, Aquatic microorganisms, Invertebrates, Crustaceans, Epizootiology, Spirulina, Penaeus, Vibrio, *Toxigenic algae, *Histology.

Blooms of a marine species of blue-green algae identified as Spirulina subsalsa were found to be related to a particular disease syndrome in raceway-reared blue shrimp, Penaeus stylirostris. The disease was characterized by necrosis of the lining epithelium of the midgut, dorsal cecum, and hindgut gland, and a consequent hemocytic enteritis. Bacterial infections due predominantly to Vibrio alginolyticus were common in affected shrimp and presumed to be a secondary condition resulting from necrosis of the gut epithelium. These bacterial infections were expressed as local abscesses near or on the gut or as fulminating septicemias. (EIS-Katz)

ECOLOGICAL EFFECTS OF COOLING WATER OF A POWER PLANT AT KIEL FJORD,
Kiel Univ. (West Germany). Inst. fuer Meereskunde.
H. Moller.
Berichte der Deutschen Wissenschaftlichen Kommission fur Meeresforschung, Vol 26, No 3-4, p 117-130, 1978. 7 fig, 6 tab, 49 ref.

Descriptors: *Water temperature, Powerplants, Cooling water, *Zooplankton, *Fish, Food organisms, *Discharge(Water), Benthic fauna, Productivity, Environmental effects, Benthos, Currents(Water), Biological communities, Aquatic environment, Movement, Eels, Mussels, Ecosystems, *Kiel fjord, *Impingement.

Effects of temperature increase are of little importance when compared with effects of artificial currents. Near the discharge as well as near the intake increased transport of planktonic food causes an elevated production of zoobenthos. Cod and eel are attracted into this area because of favourable food conditions. There is no rise in the incidence of fish infected with parasites or diseases in the outlet area. The number of fish damaged at the intake screens is low. Settling of blue mussel and barnacles in relatively deep bottom regions near the discharge indicates a good supply of oxygen in this area. Changes in the macrobenthic fauna due to plant operation were limited to an area of about 0.01 sq km. There was a mass invasion of shore crabs and eels into the discharge area after a close down of the plant in the summer. Ten days after the close down, the benthic population in front of the plant was reduced sharply. (EIS-Katz)

The influence of water, conditioned with fish excreta, was tested by measuring the oxygen consumption of juvenile Tilapia zillii (0.7 to 24.8 g wet weight). The results indicate a slight increase of aerobic metabolism in a loaded water regime, thus confirming other results found in crowded conditions, where fish metabolism was increased and energy utilization decreased. Single fish showed a reduced oxygen consumption, compared with the mean of grouped fish. (EIS-Katz)

Descriptors: *Absorption, *Fish eggs, *Salmonids, *Metabolism, Hatching, *Biological membranes, Fish reproduction, Water pollution effects, Organic compounds, Environmental effects, Laboratory tests, Growth stages, Fish physiology, Biochemistry, Membrane processes, *Bioaccumulation, *Naphthalene, *Benzopyrene, Penetration.

This study compares the difference in accumulation of carbon radioactive naphthalene, 3,4-benzopyrene and n-hexadecane in salmon eggs (Salmo salar) just prior to hatching. The test concentrations ranged from 4.6 to 13.9 ppb and also 0.2 ppb for naphthalene. Whole eggs as well as single dissected parts of eggs were analysed for hydrocarbon uptake with time. The comparison of the regression coefficient b of the accumulation equation, $\log y = \log a + b \log x$, show a similar behavior for naphthalene and benzopyrene and a much slower accumulation and penetration for hexadecane which is even lower than for a naphthalene solution of 1/20 concentration. The penetration (portion of penetrated hydrocarbon to total accumulation) is fastest in naphthalene; 98% in 12 hours, 85% for benzopyrene. In hexadecane the penetration seems to slow down, the portion accumulated on the chorion increases. Hydrocarbons that penetrated the chorion are accumulated most in the yolk and egg fluid. The data are discussed in regard to possible hydrocarbon metabolism. (EIS-Katz)

EFFECTS OF SOME ENVIRONMENTAL FACTORS ON GROWTH AND FOOD CONSUMPTION OF THE BALTIC PALAEMONID SHRIMP, PALAEMON ADSPERSUS VAR. FABRICII (RATHKE),
Kiel Univ. (West Germany). Inst. fuer Meereskunde.
N. M. Inyang.
Berichte der Deutschen Wissenschaftlichen Kommission fur Meeresforschung, Vol 26, No 1-2, p 30-41, 1978. 29 ref, 8 tab, 3 fig.

Descriptors: *Salinity, Environmental effects, *Growth rates, *Water temperature, *Shrimp, *Diets, *Metabolism, *Aquiculture, Laboratory tests, Temperature, Crustaceans, Invertebrates, Commercial shellfish, Fish diets, Fish food organisms, Brine shrimp, Palaemon, *Artemia.

Experimental studies with Palaemon adspersus var. fabricii show that its growth rate is influenced by the amount and kind of food, water temperature and salinity. The average growth rate of the shrimp on half the normal daily food intake (feeding with adult Artemia) reached about 40% of the weight increase of the individuals fed to satiation. Feeding with Artemia and Crangon gave a better growth rate than with Mytilus and Tubifex. The percentage weight increase at 20C was twice that at 15C. At 20C growth was better at 18% salinity than at 10% and 35% salinities. The amount of food (adult Artemia) consumed by the shrimp (av. length 30 mm) at 20C was about 4.5 mg (dry weight) per shrimp per day. Food consumption and food conversion efficiency was higher at 20C than at 15C. Salinity also influenced the amount of food intake. (EIS-Katz)

THE INFLUENCE OF SALINITY AND TEMPERATURE ON GROWTH, METABOLISM AND LETHAL TEMPERATURE OF THE SAND GOBY, POMATOSCHISTUS MICROPS K. (DER EINFLUSS VON SALZGEHALT UND TEMPERATUR AUF WACHSTUM STOFFWECHSEL UND LETALTEMPERATUR DER STRANDGRUNDEL POMATOSCHISTUS MICROPS K.),
Kiel Univ. (West Germany). Inst. fuer Meereskunde.
W. Tolksdorf.
Berichte der Deutschen Wissenschaftlicher Kommission fur Meeresforschung. Vol. 26, No. 1-2, p 15-29, 1978. 32 ref, 6 tab, 4 fig, In German with English Abstract.

Descriptors: *Salinity, *Water temperature, *Metabolism, *Adaptation, *Growth rates, *Feeding rates, Environmental effects, Fish physiology, Osmoregulation, Habitats, Temperature, Water properties, Laboratory tests, Lethal limit, Pomatoschistus, *Sand Gobies, *Osmoregulation.

Sand gobies Pomatoschistus microps were adapted to 4,5%, 9%, 13,5% and 18% salinity at 15C and 20C. Food intake, growth and metabolism were tested at adaptation temperature, further the reaction of metabolism was tested to continuously increased temperature up to 32C. Upper lethal temperature was determined by further continuously increased temperature. A long-term adaptation of P. microps to a salinity of 4.5% at 20C is not possible, but no problem was encountered in keeping the fish at other combinations of temperature and salinity. The lethal temperature for fish acclimated to 15C increases with increasing salinity from 4,5% to 13,5%. No special energy demand for osmoregulation could be determined. (EIS-Katz)

NET-AND NANOPLANKTON: EFFECTS OF AN OIL SPILL IN THE NORTH SEA,

Nordic Council for Marine Biology, Blomsterdalen (Norway).
C. Lannergren.
Botanica Marina, Vol. 21. p 353-356, 1978. 3 fig, 2 tab, 13 ref.

Descriptors: *Oil spills, *Nannoplankton, *Photosynthesis, Oil, Oil pollution, Biomass, Productivity, Diatoms, Trophic level, Offshore platforms, Herbivores, Phytoplankton, Toxicity, Growth rates, Water pollution effects, *Crude oil, *North Sea.

Following an oil spill in the North Sea carbon assimilation and biomass of phytoplankton were studied in three size fractions, greater than 30 micro m, 5-30 micro m, and less than 5 micro m. No harmful effects were detected; on the contrary the largest biomass and production occurred in the most contaminated water, containing about 260 ppb of petroleum hydrocarbons. The higher values were associated with the fraction greater than 30 micro m, presumably diatoms. It is uncertain if this was a direct effect, or the result of reduced grazing by herbivores in the presence of oil. (EIS-Deal)

A MODEL OF THE BIOLOGICAL EFFECTS OF EUTROPHICATION IN THE NORTH SEA,

Danmarks Fishkeri- og Havundersogelser, Charlottenlund.
E. Ursin, and K. P. Andersen.
Rapports Et Proces-Verbaux Des Reunions Conseil International Pour L'Exploration De La Mer, Vol. 172, p 366-377, 1978. 4 tab, 14 ref.

Descriptors: *Mathematical models, *Phosphorus, *Nutrients, *Model studies, Eutrophication, Trophic level, Nutrient requirements, Ecosystems, Primary productivity, Phytoplankton, Aquatic populations, Municipal wastes, Sewage effluents, Commercial fish, Fish production, *North Sea.

In a model of the pathways of phosphorus through the North Sea ecosystem, first, a steady supply of nutrients from rivers, etc. was simulated, and next, an increasing supply. With apparently realistic data for water exchange and nutrient supply the model predicted a slight increase in the yield of fish, far from sufficient to describe the observed yield increase over the period 1960-1970. Recommendations for modification of several parameters of the model were offered. (EIS-Deal)
W79-02469

A METHOD OF PREDICTING THE BIOLOGICAL EFFECTS OF SYNTHETIC POLLUTANTS IN THE NORTH SEA,

Danmarks Fishkeri- og Havundersogelser, Charlottenlund.
H. Lassen.
Rapports Et Proces-Verbaux Des Reunions Conseil International Pour L'Exploration De La Mer, Vol. 172, p 378-383, 1978. 2 tab, 7 ref.

Descriptors: *Model studies, *Mathematical models, *DDT, *Polychlorinated biphenyls, Fish populations, Aquatic populations, Persistence, Pesticide kinetics, Pesticide residues, Organic compounds, Food webs, Productivity, Primary productivity, Trophic level, Fish reproduction, Mortality, Biomass, *North Sea, *Non-degradable compounds.

The ecomodel of Andersen and Ursin is extended to include a non-degradable chemical compound such as DDT or PCB. A simplified 'sea' holding four species is used to illustrate some features of the model. (EIS-Deal)

BLOOD CORPUSCLE RESISTANCE OF CARP DIED OF ENVIRONMENTAL HYPOXIA AND OF CYANIDE POISONING, (IN JAPANESE),

Hiroshima Univ. (Japan). Dept. of Fisheries.
S. Murachi, K. Nanba, and A. Hikite
Journal of the Faculty of Fisheries and Animal Husbandry of Hiroshima University, Vol. 17, p 91-96, 1978. 5 fig, 2 tab, 10 ref.

Descriptors: *Fish diseases, *Mortality, *Toxicity, *Carp, Fish physiology, Cytological studies, Oxygen requirements, Poisons, Fishkill, Anaerobic conditions, Oxygen, *Hypoxia, Tissue analysis, *Cyanide, Red blood cells

Blood corpuscle resistance (BCR) of carp was significantly lowered immediately after death by environmental hypoxia, while it remained at the same level as the normal one when the fish died of cyanide poisoning. However, 24 hours after the fish were dead, the BCR decreased in the case of death by cyanide poisoning, whereas it increased in the case of death by environmental hypoxia, when compared with its level immediately after death. The results indicate that the measurement of BCR of fish within several hours after death may be applicable in judging whether the cause of fish death was environmental hypoxia. (EIS-Deal)

EFFECTS OF BURIAL ON THE HEART COCKLE CLINOCARDIUM NUTTALLII AND THE DUNGENESS CRAB CANCER MAGISTER,

Fisheries and Marine Service, West Vancouver (British Columbia)
B. D. Chang, and C. D. Levings.
Estuarine and Coastal Marine Science, Vol. 7, p 409-412, 1978. 2 tab, 9 ref.

Descriptors: *Crabs, *Dredging, Animal behavior, Spoil banks, Mortality, Sand, Bottom sediments, Benthic fauna, *Waste disposal, Waste dump, Crustaceans, Environmental effects, *Mulluscs, *Heart cockle, Clinocardium, Dungrass crabs

Burial experiments with dredge spoil sand were performed in the laboratory using heart cockle and the Dungegrass crab. All cockles buried by 5 cm or less re-established siphon contact with water in less than 24 h. Under 10 cm of sand, less than 50% reached the surface within 24 while none did so under 20 cm sand. All crabs reached the surface in less than 24 h burial by 10 cm or less of sand, while none did so under 20 cm. (EIS-Deal)
W79-02472

EFFECTS OF THERMAL DISCHARGES ON MORTALITY OF MERCENARIA MERCENARIA IN BARNEGAT BAY, NEW JERSEY,

Jersey Central Power and Light Co. Morristown, NJ. Environmental Affairs Dept.
M J Kennish
Environmental Geology, Vol. 2, No. 4, p 223-254, 1978. 16 fig, 27 tab, 49 ref.

Descriptors: *Mollusks, *Mortality, *Thermal pollution, *Clams, Animal populations, Heated water, Water temperature, Growth rates, Life history studies, Seasonal, Animal physiology, Nuclear powerplants, Benthic fauna, Animal behavior, Growth stages, New Jersey, *Barnegat Bay(NJ).

Thermal discharges from the Oyster Creek Nuclear Generating Station do not affect mortality in natural populations of Mercenaria mercenaria in Barnegat Bay, New Jersey. The analyses of daily growth increments and disturbance bands in shell cross-sections of death assemblages of the pelecypods collected at the mouth of Oyster Creek (strongly affected by thermal discharges) and at three control sites (unaffected by thermal discharges) in the bay indicate that similar mortality patterns exist in all assemblages. This is revealed by mortality rate curve, survivorship curves, and life tables, which are nearly identical for each assemblage. (EIS-Deal)

ECO-BIOCHEMICAL STUDIES ON SOME ECONOMICALLY IMPORTANT INTERTIDAL ALGAE FROM PORT OKHA (INDIA),

Saurashta Univ., Rajkot (India). Dept. of Biosciences.
M. S. Murthy, and P. Radia.
Botanica Marina, Vol. 21, p 417-422, 1978. 7 fig, 1 ref

Descriptors: *Marine algae, *Primary productivity, *Protein, Biochemistry, Ecosystems, Niches, Chemical analysis, Water temperature, Hydrogen ion concentration, Salinity, Cytological studies, Photosynthesis, Lipids, Carbohydrates, Sodium, Potassium, Calcium, Phosphorus, Metabolism, Aquiculture, Ulva, Gelidiella, Sargassum

An attempt was made to study the biochemical contents of Ulva lactuca, Gelidiella acerosa, and Sargassum swartzii and to correlate them with ecological factors of the marine environment. There was a close relationship between the net primary productivity and protein content in S. swartzii. An inverse relation existed between crude fat and crude fibre content in all 3 algae studied. Factors like temperature, salinity, pH had no bearing on the different biochemical contents of the algae. Water deficiency due to more exposure and consequently increased light in the case of S. swartzii and G. acerosa enhanced fat formation. (EIS-Deal)

GROWTH-INFLUENCING SUBSTANCES IN SEDIMENT EXTRACTS FROM A SUBTROPICAL WETLAND: INVESTIGATION USING A DIATOM BIOASSAY,

Rosenstiel School of Marine and Atmospheric Science, Miami, FL. Div. of Biology and Living Resources.
K. E. Cooksey, and B. Cooksey
Journal of Phycology, Vol. 14, p 347-352, 1978. 3 fig, 3 tab, 28 ref.

Descriptors: *Diatoms, *Growth rates, *Plant growth substances, *Mangrove swamps, *Bioassay, Inhibition, Inhibitors, Sediments, Seasonal, Organic compounds, Biochemistry, Metabolism, Plant physiology, Ecosystems, Wetlands, *Heterotrophy, *Mixotrophy, Amphora

A biological assay using Amphora coffeaeformis perpusilla and A. coffeaeformis was used to investigate the changes in the properties of soluble organic carbon in sediments taken from a coastal wetland. During January to May, sediment extracts became increasingly inhibitory to diatom growth. After the onset of the spring rains, the inhibitory properties of the extracts disappeared. Substances capable of promoting mixotrophic growth and heterotrophic growth were found in extracts taken in July to December. These positive responses took place at the time of mangrove leaf fall. EFFECT OF METHALLIBURE ON THE HYPOPHYSIS AND GONADAL DEVELOPMENT OF THE CICHLID FISH, TILAPIA MOSSAMBICA,

Niigata Univ. (Japan). Biological Lab.
A. Chiba, Y. Honma, and W. J. R. Lanzing.
Japanese Journal of Icthyology, Vol. 25, No. 2, 107-114, 1978. 6 fig, 1 tab, 20 ref.

Descriptors: *Cichlids, *Fish reproduction, Growth stage, Growth rates, Inhibition, Reproduction, *Cytological studies, Juvenile growth, Toxicity, Fish physiology, Animal metabolism, Biochemistry, Bioassay, *Tilapia, Tissue analysis, *Methallibure, *Hypophysis, Hormones

The present paper describes histological and cytological changes in the hypophysis and gonads of juvenile Tilapia mossambica exposed to the anti-gonadotropic drug methallibure. This treatment markedly inhibited the process of maturation and gametogenesis in both sexes, in addition to retardation of differentiation of interstitial cells and epithelial lining of the efferent duct of the testis. T

olygonal basophils (gonadotrophs) located in the ntral portion of the proximal pars distalis of the pophysis underwent a marked decrease in cell e as well as in the amount of cytoplasmic gran- es of glycoproteinaceous nature. Atrophy was nifested by the acidophils (somatotrophs) of the oximal pars distalis and the PAS positive cells of e pars intermedia, whereas no appreciable ange was recognized in other cell types of the enohypophysis. MICROORGANISMS AND HEAVY METAL TOXICITY,
University Coll., Cardiff (Wales). Dept. of Microbiology.
G. M. Gadd, and A. J. Griffiths.
Microbial Ecology, Vol. 4, p 303-317, 1978. 120 ref.

Descriptors: *Heavy metal, *Toxicity, *Microorganisms, *Microbiology, Physiology, Metabolism, Resistance, Chemical properties, Chemical reactions, Biochemistry, Ions, Cytological studies, Genetics, Adaptation, Bacteria, *Mercury, *Cadmium, Microbial degradation, Fungi, Chemical degradation, Absorption, Nickel, Cobalt, Zinc, Manganese, Magnesium, Calcium, Biotransformation, Bioaccumulation, *Methylmercury, *Detoxification.

The environmental and microbiological factors that can influence heavy metal toxicity are discussed with a view to understanding the mechanisms of microbial metal tolerance. It is apparent that metal toxicity can be heavily influenced by environmental conditions. Binding of metals to organic materials, precipitation, complexation, and ionic interactions are all important phenomena that must be considered carefully in laboratory and field studies. It is also obvious that microbes posses a range of tolerance mechanisms, most featuring some kind of detoxification. Many of these detoxification mechanisms occur widely in the microbial world and are not only specific to microbes growing in metal-contaminated environments. (EIS-Deal)

EFFECT OF BARITE (BASO4) ON DEVELOPMENT OF ESTUARINE COMMUNITIES,
Environmental Research Lab., Gulf Breeze, FL.
M. E. Tagatz, and M. Tobia.
Estuarine and Coastal Marine Science, Vol. 7, p 401-407, 1978. 1 fig, 3 tab, 11 ref.

Descriptors: *Oil wells, *Toxicity, *Drilling fluids, *Mud., *Biological communities, Drilling, Sulfates, Estuaries, Plankton, Sand, Larval growth stage, Annelids, Mollusks, Growth rates, Clams, Benthic fauna, *Barite, *Barium compounds.

Barite, the primary component of oil drilling muds, affected the composition of estuarine communities developed from planktonic larvae in aquaria containing sand and flowing estuarine water. Annelids were particularly affected and significantly fewer were found in all treatments than in the control. Mollusks decreased markedly in number only in barite-covered aquaria. Barite, however, did not impede growth of the abundant clam, Laevicardium mortoni, or decrease abundance of six other phyla. Our data indicate that large quantities of this compound, as discharged in offshore oil drilling possibly could adversely affect the colonization of benthic animals. (EIS-Deal)

THE EFFECTS OF PETROLEUM ON THE SALT MARSH ECOSYSTEM,
College of William and Mary, Williamsburg, VA. Dept. of Marine Sciences.
J. L. Lake.
PhD Dissertation, 1977. 137 p.

Descriptors: *Salt marshes, *Oil, *Water pollution effects, *Marsh plants, *Aquatic animals, Wetlands, Coastal marshes, Morbidity, Water pollution, Environmental effects, Pollutants, Sediments, Organic compounds.

The research examines the effects of chronic, low level oil pollution on salt marsh ecosystems. Two marshes were dosed monthly with No. 2 fuel oil while a third served as a control. In the first marsh the distribution and incorporation of oil into Spartina alterniflora and sediments were determined. Examination of the alkane fraction extracted from the sediment showed a decrease in the concentrations of n-alkanes relative to that of the isoprenoids, pristane, and phytane, eight to nineteen weeks after the final oil dosing. The most significant consequence of the low level dosing was the damage to the S. alterniflora. Loss of grass production due to the oiling was estimated at 52.5%. Plant mortality resulted in extensive erosion of the underlying peat and sediment in areas of oil accumulation. Recovery has been slow. The second marsh was examined in terms of the accumulation, retention, and in situ depuration of petroleum compounds by four marsh organisms: Modiolus demissus, Crassostrea virginica, Littorina irrorata, and Nereis succinea. Except for the saturates of Littorina irrorata, the organisms rapidly depurated the petroleum compounds which they had accumulated during dosing. However, it appears that some organisms accumulated or selectively retained some aromatic hydrocarbons during depuration. (Steiner-Mass)

STUDIES ON THE EFFECTS OF THE ENVIRONMENT ON THE HEART RATE OF SHELLFISHES. II. EFFECTS OF TEMPERATURE, LOW SALINITY AND HYPOXIA ON THE HEART RATE OF AN ABALONE HALIO-

TIS (NORDOTIS) DISCUS HANNAI INO. (IN JAPANESE),
Hokkaido Regional Fisheries Research Lab. (Japan).
T. Nakanishi.
Bulletin of the Hokkaido Regional Fisheries Research Laboratory, No. 43, p 59-68, 1978. 7 fig, 5 ref.

Descriptors: *Animal physiology, *Water temperature, *Salinity, *Oxygenation, Oxygen, Oxygen requirements, Toxicity, Mortality, Shellfish, Commercial shellfish, Heated water, Sea water, *Abalone, Heart rate.

The effect of temperature on the heart rate was studied at eight temperatures from -1.8C to 33C at 5 degree intervals. At the highest and lowest temperatures every abalone died. In general, heart rate increased with temperature, reaching a maximum rate at 28C. When the effect of salinity was examined it was noted that heart rate decreased with salinity. As for the effect of oxygen saturation, above 30% the heart rate increased, while below 30% it decreased. (See also W77-11265) (EIS-Katz)

EFFECTS OF INGESTING MERCURY-CONTAINING BACTERIA ON MERCURY TOLERANCE AND GROWTH RATES OF CILIATES,
Maryland Univ., College Park. Dept. of Microbiology.
S. G. Berk, A. L. Mills, D. L. Hendricks, and R. R. Colwell.
Microbial Ecology, Vol. 4, p 319-330, 1978. 2 fig, 5 tab, 26 ref.

Descriptors: *Protozoa, *Mercury, *Resistance, *Adaptation, Bacteria, Mortality, Evolution, Growth rates, Heavy metals, Toxicity, Animal populations, Pseudomonas, Chesapeake Bay, Food chains, Path of pollutants, Uronema.

The ciliate Uronema nigricans was found to acquire tolerance to mercury after being fed mercury-laden bacteria followed by exposure of washed suspensions of these ciliates to various concentrations of mercury in solution. Significant differences in percent mortality were observed for ciliates fed mercury-laden bacteria compared with control suspensions fed mercury-free bacteria. The phenomenon of acquired mercury tolerance was demonstrated within a single generation time. The effect of ingesting mercury-laden bacteria on growth rate of Uronema was examined, and results showed no significant differences in growth rates of both 3- and 14-day-old cultures of protozoa that had been fed mercury-laden and mercury-free bacteria under controlled conditions. THE URQUIOLA OIL SPILL, LA CORUNA, SPAIN: IMPACT AND REACTION ON BEACHES AND ROCKY COASTS,
South Carolina Univ., Columbia. Dept. of Geology.
E. R. Gundlach, C. H. Ruby, M. O. Hayes, and A. E. Blount.
Environmental Geology, Vol 2, No 3, p 131-143, 1978. 14 fig, 1 tab, 14 ref.

Descriptors: *Oil spills, *Beaches, *Coasts, Oil, Oil pollution, Sands, Particle size, Waves(Water), Tides, Path of pollutants, Water pollution effects, Sediments, *Crude oil, *Spain, Tanker Urquila, Rocky coasts.

The impact and interaction of oil on fine-sand, coarse-sand, and gravel beaches and on sheltered and exposed rocky coasts was monitored in detail. The surficial distribution of oil on the beaches was influenced primarily by wave activity, tidal stage, and oil quantity. Heaviest accumulations formed along the high-tide swash line. Within beach sediments, oil was present at distinct oiled sediment layers, which were often deeply buried. The depth of burial was related to wave energy and sediment type. The thickness of oiled sediment depended on sedimentary characteristics, the quantity of oil present, and wave action and capillary forces. (EIS-Deal)

ECONOMIC EVALUATION OF FOUR SLUDGE DEWATERING DEVICES,
T. Viraraghavan, and R. C. Landine.
Pollution Engineering, Vol 10, No 9, p 55-57, Sept 78. 5 fig, 2 tab.

Descriptors: *Sludge treatment, *Dewatering, *Waste water treatment, Equipment, *Alternative costs, *Sludge disposal, Alternative planning, Decision making, Economics, Evaluations, Canada, New Brunswick(Canada), Vacuum filters, Centrifugation, Filter presses, Belt filter presses, Filters, Filtration, Technology, Cost-effectiveness.

Four sludge dewatering methods (vacuum filter, centrifuge, filter press, and belt filter press) were evaluated in terms of technology and economics for use in a proposed municipal wastewater treatment plant in New Brunswick, Canada. The sludge treatment system consists of thickening a mixture of primary and secondary sludge, chemical conditioning, dewatering by one of the four mechanical dewatering units, and ultimate disposal in a landfill. Preliminary economic evaluation (total costs) showed that centrifuges ($46-65/ton dry solids) and belt filter presses ($45-63/ton dry solids) are both cost-effective for the case studied. Filter presses are most expensive ($80-100/ton dry solids), followed by vacuum filters ($58-68/ton dry solids). While the vacuum filter system had the lowest total capital costs ($95,700), the annual operation and maintenance costs of the belt filter press ($29,000) and centrifuge ($34,600) were considerably lower than the other two options. Capital costs for the other three systems ranged from $109,800 to $139,400; annual operating costs were $46,400 for vacuum filters and $61,400 for filter presses. (Lynch-Wisconsin)

COMBINATION LIMESTONE-LIME NEUTRALIZATION OF FERROUS IRON ACID MINE DRAINAGE,
Industrial Environmental Research Lab., Cincinnati, OH.
R. C. Wilmoth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 169, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-002, January 1978. 60 p, 10 fig, 18 tab, 6 ref.

Descriptors: *Acid mine water *Acid base equilibrium, *Mine drainage, *Limestone, *Sludge treatment, Chemical reactions, Neutralization, Ferrous iron, West Virginia, Lime, Cost-benefit analysis, Calcium hydroxides.

Results of studies conducted to evaluate combination limestone-lime treatment of ferrous iron acid mine drainage (AMD) are presented. Treatment was by a two-step neutralization process, whereby rock-dust limestone was mixed with the influent AMD and then hydrated lime was added in a polishing reactor. Combination first-stage limestone and second stage lime treatment of the AMD resulted in better than 30% reduction in reagent usage cost as compared to single-stage hydrated lime treatment of the same AMD. An equal cost reduction (compared to single-stage lime treatment) when a two-stage hydrated lime process in which the AMD and the recycled sludge were mixed in the first reaction vessel and hydrated lime was added to the second reactor. In situations where sludge was not recycled no cost advantage appeared to exist. (Davison-IPA)

THE CHARACTERIZATION OF BACILLUS CAPABLE OF BLUE-GREEN BACTERICIDAL ACTIVITY,
Delaware Univ., Newark. Dept. of Biological Sciences.
R. L. Reim, M. S. Shane, and R. E. Cannon.
Canadian Journal of Microbiology, Vol. 20, p 981-986, March 18, 1974. 3 fig, 3 tab, 13 ref. OWRT A-016-DEL(6).

Descriptors: *Cyanophyta, *Bactericides, *Bacteria, Biocontrol, Oxidation ponds, Viruses, *Bacillus brevis, Antibacterial activity, *Lysogeny.

A gram-negative, aerobic, spore-forming Bacillus isolated from a sewage oxidation pond was found to have a lytic effect on a wide variety of blue-green bacteria and on several bacteria, including other bacilli. The isolate, designated 247, has been identified as an atypical Bacillus brevis. The lytic activity was found in the culture filtrate and was produced during the stationary phase of growth. When the culture filtrate was applied to the interaction between plectonema boryanum ad LPP-cyanophages, it facilitated the establishment of lysogeny by these viruses. (Heson - Delaware)

Journal of Catalysis, Vol 35, p 140-152, (1974). 7 fig, 47 ref. OWRT A-027-DEL(2).

Descriptors: Oxidation, Catalysts, Chemical reactions, Phenols, Kinetics, Industrial wastes, *Waste water treatment, Ultimate disposal, Chemical wastes, Free radicals, Catalytic oxidation, Aqueous-Phase oxidation.

Aqueous-phase of phenol over copper oxide was studied between 369-393 degrees K and 1-17 atm oxygen pressure in batchwise mode. The reaction involves an induction period and a steady-state activity regime. The initial rate is first order in phenol and oxygen, but the rate is one-half order in oxygen in the steady-state activity regime. Heterogeneously catalyzed aqueous-phase phenol oxidation occurs by a free-radical mechanism which involves initiation on the catalyst surface, homogeneous propagation and either predominantly homogeneous or heterogeneous termination depending on catalyst concentration. That a free-radical mechanism is involved is indicated by the induction period, by the observed reaction kinetics, by free-radical inhibitor studies which show the same inhibitor efficiencies as observed in free-radical oxidation and by pH studies. The involvement of a heterogeneous-homogeneous raction mechanism is indicated by dependence of the reaction rate on catalyst concentration.

BARK AS A MEDIUM FOR GRAVITY DEWATERING OF SECONDARY SLUDGE FROM PULP AND PAPER MILLS,
Mississippi State Univ., Mississippi State. Dept. of Chemical Engineering.
G. R. Lightsey, and W. B. Hall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 699 Price codes: A03 in paper copy. Water Resources Research Institute, Mississippi State University, Report, October 1978. 28 p, 13 fig, 3 tab, 11 ref. OWRT A-117-MISS(1), 14-34-0001-8026.

Descriptors: *Secondary sludge dewatering, *Dual media filters, *Pulp and paper mill sludge, *Sludge dewatering, Suspended solids, Settleable solids, Biological wastes, Sludge treatment, *Bark filters, *Secondary sludge, Pulp and paper mills.

The objective was to evaluate the use of bark filters for gravity dewatering of secondary sludge from pulp and paper mills. Samples of secondary sludge were collected from various pulp and paper mills and passed through filtering beds containing both hogged and unhogged softwood barks. The characteristics of the sludges were measured both before and after gravity dewatering on the bark filters. Due to frequent clogging of flow control mechanism a declining flow rate mode was used. Significant reductions in settleable solids and in total solids were achieved only in filters containing bark that had passed through an 1/8 inch screen. Moderate reductions in settleable and total solids were found with filters containing bark passing 1/4 inch caught on 1/8 inch screen. Larger bark sizes have little filtering action. Bark filters, if blinding were reduced, could be used effectively to dewater secondary sludge.

ECONOMIC IMPACT OF ALTERNATIVE STORMWATER DRAINAGE SYSTEMS,
Purdue Univ., Lafayette, IN. Dept. of Agricultural Economics.
J. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 797, Price codes: A04 in paper copy, A01 in microfiche. Purdue University Water Resources Research Center Technical Report No. 111. November 1978. 48 p, 3 fig, 18 tab, 20 ref, 3 append. OWRT C-6106 (No. 5213)(6).

Descriptors: *Urban drainage, *Drainage systems, *Detention reservoirs, *Cost analysis, Storm runoff, Storm drains, Urban hydrology, Surface drainage, Pipelines, Detention, Storage requirements, *Detention storage.

Economic comparisons are made of 15 urban drainage designs considering combinations of open channel, pipe, and detention storage. Emphasis was placed on detention storage in order to permit evaluation of the detention storage with relation to different scales of treatment plants. The systems were designed for a 1,912 acre watershed in West Lafayette, Indiana. Complete pipeline systems with no open channels that have detention storage were more costly than pipelines without detention storage. Detention storage is more costly than pipeline alone even when the storage is a low grass area in a recreational park rather than a concrete lined facility. A single large volume detention facility is less costly than multiple facilities. With very large volumes of detention storage the number of facilities has strong interaction with the location of the facility, hence the economically least expensive system is a joint function of size, number and location. WINERY WASTEWATER CHARACTERISTICS AND TREATMENT,
French (R. T.) Co., Shelley, ID.
K. L. Sirrine, P. H. Russell, Jr., and J. Makepeace.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 932, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-102, June 1977. 76p, 24 fig, 8 tab, 5 ref, 1 append.

Descriptors: *Food processing industry, *Activated sludge, *Treatment facilities, *Pilot plants, *Nutrient requirements, Industrial wastes, Aerobic treatment, Tertiary treatment, Waste water treatment, Winery wastes, Grape processing.

The characteristics of winery waste water and methods of treatment were investigated at the Widmer Wine Cellars in Naples, New York. Design factors related to grape processing and effluent requirements are discussed. Since wine making includes a grape pressing phase and a processing phase, waste water characteristics are given for both seasons. An interceptor sewer and a waste water treatment facility which included an entrance structure, aeration units, a final clarifier, a tertiary sand filter, and an aerobic digester were constructed as part of the study. The facilities were used to study the effects of variable food-to-microorganism ratios, establish the reaction rate for winery waste water, and to examine nutrient and neutralization needs. Operation of the facility indicated that long-term activated sludge processes followed by tertiary sand filtration were capable of reducing influent BOD of 1370 mg/liter and solids concentrations of 182 mg/liter by 96%. Freezing temperatures during the winter hindered operations of the aeration basins, clarifier, and diverter boxes. Additions of nitrogen and phosphorus to provide a BOD:N:P ratio of 100:5:1 were required to insure proper sludge formation, treatment, and settling. Reaction rate constants determined by the study were 0.0066 at 20C for the pressing season and 0.022 at 20C for the processing season. Construction and operating costs are presented for the facility. (Schultz-FIRL)

CHARACTERIZATION AND IN-PLANT REDUCTION OF WASTEWATER FROM HOG SLAUGHTERING OPERATIONS,
Wisconsin Univ.-Madison.
P. M. Berthouex, D. L. Grothman, D. O. Dencker, and L. J. P. Scully.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 091, Price codes: A08 in paper copy, A01 in microfiche. Report EPA-600/2-77-097, May 1977. 171 p, 38 fig, 27 tab, 3 ref, 5 append.

Descriptors: *Food processing industry, *Hogs, *Treatment facilities, *Water utilization, *Water conservation, Industrial wastes, Costs, On-site data collections, Organic wastes, Organic loading, Waste water treatment, Hog slaughtering wastes, Meat packing wastes.

The character and quantity of wastes generated in a typical hog slaughtering operation were examined at Oscar Mayer plants in Madison, Wisconsin; Beardstown, Illinois; and Davenport, Iowa. Hog slaughter and carcass handling operations at the facilities are described. Waste water characteristics presented for the production shift, cleanup shift, and total hog kill floor effluent include total solids, suspended solids, volatile solids fractions, COD, total Kjeldahl nitrogen, total organic carbon, BOD, and grease. Waste water collection and treatment systems at the three facilities are examined. Process modifications to reduce the waste water flow and pollution load are evaluated. Process changes in the stick and bleed area, the scald tank, the dehairing area, the rail polisher, the carcass shower, the carcass work-up area, the evisceration treadmill and viscera pans, the hasher-washer, the stomach washer, the neck washer, and the chitterling washer resulted in annual savings of up to $129,000 above the cost of the modification. A strategy for in-plant studies to reduce waste water production is presented. (Schulz-FIRL)
W79-02298

OZONE TREATMENT OF CYANIDE-BEARING PLATING WASTE,
PCI Ozone Corp., West Caldwell, NJ.
L. J. Bollyky.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 015, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-104, June 1977. 51 p, 2 fig, 17 tab, 21 ref.

Descriptors: *Ozone, *Cyanide, *Electronic equipment, *Separation techniques, *Oxidation, Pilot plants, Chemical wastes, Industrial wastes, Metals, Copper, Gold, Silver, Waste water treatment, Electroplating wastes.

A study was conducted to evaluate the use of ozone to treat cyanide wastes from electroplating processes as an alternative to conventional chemical treatment methods. Full-scale studies were conducted in Wichita, Kansas, at Sealectro Corporation, an electronics manufacturing plant which uses copper, gold, and silver plating in its operations. Acidic metal wastes and alkaline cyanide waste streams are collected separately and can be stored in underground equalization tanks. The treatment system also includes a PCI Model G-20-M Ozone Generator, a pH control system, an ozone reactor, a caustic tank, a flash mixer, and a settling tank. Studies on the effects of changes in process parameters indicated that the optimum process parameters for the Sealectro plating waste treatment plant were an ozone dosage of 1-1.5 mole O3/mole CN(-) or 1.85-2.8 mg/liter O3 per mg/liter; a pH of 7.5-9.5 for the cyanide waste; a pH of 9.0-9.5 for the final treated effluent in the settling tank; and ambient temperatures of 14-20 C. Cyanides and cyanates were destroyed by oxidation, and copper and silver were removed as oxides during the

treatment process. Capital costs for the system were $66,613 in 1973 and operating costs were $55.50/day. Treatment costs were $29.88/day for total CN removal with a total treatment cost of $73.26/day. (See also W77-08638) (Schulz-FIRL)
W79-02299

NEW MEMBRANES FOR TREATING METAL FINISHING EFFLUENTS BY REVERSE OSMOSIS,
Midwest Research Inst., Minneapolis, MN.
R. J. Peterson, and K. E. Cobian.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 363, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-76-197, October 1976. 69 p, 15 fig, 13 tab, 23 ref, 3 append.

Descriptors: *Membrane processes, *Reverse osmosis, *Copper, *Zinc, *Polymers, Filtration, Metals, Industrial wastes, Acidic water, Waste water treatment, Design data, Electroplating wastes, Cyanides, Membrane performance.

The NS-100 membrane, consisting of a polyurea layer created by the reaction of tolyene diisocyanate with polyethylenimine and deposited on a porous polysulfone support film, was evaluated for use in reverse osmosis treatment of electroplating wastes. Objectives of the program include the modification of the fabrication process for NS-100 tubular reverse osmosis membranes for optimum performance with metal finishing wastes, the demonstration of long-term usage of NS-100 membranes with acid and alkaline rinse waters, and the design of a field demonstration unit. Fabrication procedures for the polymers and the tube cast membranes are presented. Design data and testing procedures for the pilot-scale reverse osmosis test loop used in the evaluation are presented. Tests included 2360 hours of continuous operation with 1.27-cm tubular membranes, half at pH 1.2 (acid copper) and half at pH 12.8 (zinc cyanide). Membrane rejections were greater than 99% for copper and zinc, and greater than 96% for cyanide. Membrane fluxes for the acid copper solution were 18-24 liters/sq m/hr but only 8-15 liters/sq m/hr for the zinc cyanide solution. Two experimental membranes produced with isophthaloyl chloride instead of tolyene diisocyanate performed well with zinc rejections of 98.5% but only exhibited cyanide rejections of 90%. Reproducibility of the procedure for tubular NS-100 membranes was inadequate, since membranes which were fabricated at the beginning of the study had high permeate fluxes while membranes produced later had low fluxes and high salt rejections. (Schulz-FIRL)
W79-02300

TREATMENT OF HIGH STRENGTH MEATPACKING PLANT WASTEWATER BY LAND APPLICATION,
Texas Univ. at Paso. Dept. of Civil Engineering.
A. J. Tarquin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 582, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/2-76-302, December 1976. 49 p, 11 fig, 6 tab, 14 ref.

Descriptors: *Food processing industry, *Return flow, *Nutrient removal, *Irrigation practices, Grasses, Waste water disposal, Nitrogen, Chemical oxygen demand, Infiltration, Fescues, Organic loading, Industrial wastes, Waste water treatment, *Meatpacking wastes.

The treatment of high-strength meatpacking plant waste water by land application was investigated in pilot studies at the Peyton slaughterhouse/meatpacking plant in El Paso, Texas. Laboratory studies were conducted to examine the plant's waste water characteristics and to determine the most appropriate type of soil cover for planting in the application areas. Overland flow systems and infiltration with high-pressure and low-pressure systems at various hydraulic and organic loading rates were the two types of land application considered. Design data for the application systems are presented. Once growth was established with regular irrigation, two warm season grasses (Bermuda NK-37 and Blue Panicum) and two cool season grasses (Kentucky-31 Tall Fescue and Jose Wheatgrass) were irrigated with the meatpacking plant waste water. Studies with the infiltration systems indicated that raw waste water COD of 9400 mg/liter could be reduced by 99% at an application rate of 10 cm/week. COD removal by the overland flow system was 84% and improved with 'aging' of the application site. Nitrogen removal by the infiltration system was 72% at an application rate of 6.3 cm/week and 58% at 10 cm/week. Nitrogen removal by overland flow treatment was 44%. Aerosol drift was lower with the low-pressure infiltration system than with the high-pressure system. Further studies on waste segregation, nitrogen removal, hazards posed by pathogenic bacteria, and full-scale land application of meatpacking plant waste waters are recommended. (Schulz-FIRL)
W79-02301

LIMESTONE AND LIME NEUTRALIZATION OF FERROUS IRON ACID MINE DRAINAGE,
Environmental Protection Agency, Rivesville, WV. Resource Extraction and Handling Div.
R. C. Wilmoth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 911, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-101, May 1977. 105 p, 22 fig, 34 tab, 19 ref.

Descriptors: *Mine drainage, *Acid mine water, *Neutralization, *Limestones, *Lime, Pilot plants, Treatment facilities, Cost comparisons, Hydrogen ion concentration, Industrial wastes, Waste water treatment.

Results of a two-year study on the treatment of ferrous-iron-containing acid mine drainage with hydrate lime and rock-dust limestone neutralization are presented. The EPA neutralization facility at the Crown Mine Drainage Control Field Site near Morgantown, West Virginia, contained two parallel treatment trains in which acid mine drainage could be cycled from the turbine flow meter into: (1) a lime reactor, an aerator, and a thickener; (2) a limestone reactor, an aerator, and a thickener; or (3) a limestone reactor, a lime reactor, an aerator, and a thickener. Limestone neutralization was investigated as an alternative to lime treatment because of its cheaper costs and low-volume, high-density sludge. With limestone treatment, most effective neutralization was at a 20% sludge recycle rate, a pH value near 7, a 30-min detention time with vigorous mixing in the reactor, 4-6 hours detention in the aeration system, and the addition of coagulants at a 7 mg/liter rate. Lime treatment involved a 7-min reaction time, less than a 2-hr oxidation time, and a coagulant addition of 5 mg/liter. Although the limestone process was effective under certain conditions, the process was considered infeasible for general application to acid mine water containing more than 50 mg/liter of ferrous iron. (Schulz-FIRL)
W79-02302

HANDLING AND DISPOSAL OF SLUDGES FROM COMBINED SEWER OVERFLOW TREATMENT. PHASE II - IMPACT ASSESSMENT,
Envirex, Inc., Milwaukee, WI. Environmental Sciences Div.
K. R. Huibregtse, G. R. Morris, A. Geinopolos, and M. J. Clark.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 309, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-600/2-77-0536, December 1977. 197 p, 53 tab, 30 fig. 68-03-0242.

Descriptors: *Sewage disposal, *Sewage treatment, *Combined sewers, *Overflow, Estimated costs, Dewatering, Waste water treatment, Storm water, *Sludge disposal, *Water quality standards, Biochemical oxygen demand, Biological treatment processes, Precipitation, Organic loading, Dry weather plant sludge, Gravity thickening, Lime stabilization.

Increasing urbanization, economic expansion and water demands are contributing to the combined sewer overflow problem in the U.S. More than 1300 U.S. communities serving 36.2 million people have combined sewer systems which provide one collection system for both sanitary sewage and stormwater runoff. The discharge of these overflows during and after heavy rains is an important source of water pollution. The objective of this report is to attempt a rough quantification of the effort the U.S. will have to exert in the future, in the area of sludge handling and disposal, if full-scale treatment of combined sewer overflows (CSO) is to become a reality. Assuming an equal mix of various waste water treatment methods, an average yearly sludge volume resulting from treatment of all CSO nationwide would amount to 156.8x10 to the sixth power cu m (41.45x 10 to the ninth power gal) or 2.8% of total volume treated. Preliminary economic evaluation indicated that possible grit removing, lime stabilization, storage, gravity thickening, and land application or land fill were the most cost-effective treatment systems. Costs for overall CSO sludge handling would be dependent on the type of CSO treatment process and other considerations. Estimates indicate that initial capital costs would range from $447-10,173/ha ($181-4129/ac) with annual costs of $139-1630/ha ($56-660/ac). (See also W78-05987) (Coan-NC)
W79-02303

METHOD AND APPARATUS FOR REMOVING GRIT,
Ecodyne Corp., Lincolnshire, IL. (Assignee).
F. G. Weis
U.S. Patent No. 4,107,038, 5 p, 6 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1246, August 15, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution treatment, Separation techniques, Settling basins, Flow, Flow characteristics, Flow around objects, Suspended solids.

Grit is removed from liquid sewage by flowing such sewage into a settling chamber and causing the sewage to flow in a toroidal pattern around the periphery of the chamber. Grit falls to the floor of the settling chamber and passes radially to and then through a central opening into a grit collection chamber. Organic solids are kept in motion in the toroidal flow pattern, or lifted from the settling chamber floor and are discharged through an outlet adjacent the upper surface of the liquid in the settling chamber. Toroidal flow is created and maintained by obstructing the tangential flow path of incoming sewage with a baffle which blocks the inlet and has an edge extending above the upper surface of the liquid. A propeller rotating about a vertical axis in the center of the chamber is adjustable so as to keep the contents of the chamber impinging against the baffle as they flow around the tank in the toroidal pattern. (Sinha-OEIS)
W79-02305

METHOD OF AND APPARATUS FOR PURIFYING FLUIDS WITH RADIOACTIVE IMPURITIES,
Epicor, Inc., Linden, NJ. (Assignee).
J. A. Levendusky
U.S. Patent No. 4,107,044, 7 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1249, August 15, 1978.

Descriptors: *Patents, *Waste water treatment, *Radioactive wastes, Water pollution treatment, Ion exchange, Filtration, Demineralization, Separation techniques.

An apparatus for the purification of water containing radioactive impurities is provided wherein the necessity for the handling of spent demineralization materials and filter elements is eliminated and the apparatus is disposable after the filter element and demineralization materials are exhausted. The apparatus includes a vessel having inlet and outlet structure and provision for filtration of undissolved solids and ion exchange removal of dissolved solids. The vessel is encased in a radiation impervi-

ous material and the method contemplates utilization of filtration materials and ion exchange materials substantial to exhaustion thereafter to dispose of the entire structure. (Sinha-OEIS)
W79-02307

CONTINUOUS TREATMENT OF LIQUID EFFLUENT AND SEWAGE,
Imperial Chemical Industries Ltd., London (England) (Assignee).
G. F. G. Clough.
U.S. Patent No. 4,108,763, 5 p, 4 fig, 3 ref; Official Gazette of the United STates Patent Office, Vol 973, No 4, p 1818, August 22, 1978.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, *Sewage treatment, Industrial wastes, Oxygenation, Compressible flow, Aerobic conditions, Equipment, Decompression.

A method and apparatus for the treatment of liquid-borne sewage or effluent is described in which the liquid is circulated first through a tubular coil or a compression coil which is rotating about a vertical axis. The pressure exerted on the liquid increases continuously as the liquid passes from the innermost end of the coil to the outermost end of the coil. Next the liquid is circulated through a tubular coil or decompression coil which is rotating about a vertical axis. The pressure exerted on the liquid decreases continuously as it passes from the outermost end of the coil to the innermost end of the coil. An oxygen-containing gas is supplied to the liquid as it passes through the compression coil. When the liquid is compressed there is a reduction in the size of the oxygen-containing gas bubbles and dissolution of gas. This achieves an efficient transfer of oxygen and the aerobic process takes place efficiently. When the liquid enters the rotating decompression coil, the bubbles reappear and gradually increase in size and aid the circulation of the liquid. (Sinha-OEIS)
W79-02310

SEPARATION OF AN AQUEOUS OR WATER-MISCIBLE LIQUID FROM A FLUID MIXTURE,
Georgia-Pacific Corp., Portland, OR. (Assignee).
W. D. Cooper.
U.S. Patent No. 4,108,767, 5 p, 12 ref; Official Gazette of the United States Patent Office, Vol 973, No 4, p 1819, August 22, 1978.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, Industrial wastes, Chemical wastes, Separation techniques, Magnetic fields, Ferromagnetic iron compositions.

In many chemical processes, streams or products of water-immiscible organic liquids are obtained in which water is dispersed to various extents. Only partial separation of the water from the organic liquid may be obtained by settling, or centrifugation, and further processing is required. Therefore, a process is provided for the separation from a liquid of water of a water-miscible liquid dispersed in the fluid by use of a magnet or a magnetic field. A water soluble ferromagnetic composition selected from the group consisting of ferromagnetic iron lignosulfonates, ferromagnetic iron sulfonated tannins, and ferromagnetic iron compositions of a sulfonated phenol condensed with an aldehyde is added to the fluid containing the dispersed water. The water-soluble ferromagnetic composition is intermixed with the fluid mixture which is then subjected to a magnetic field resulting in the mixture being attracted and thus separated. (Sinha-OEIS)
W79-02311

METHOD OF CLARIFYING INDUSTRIAL WASTE WATER,
Winchester Chemical Co., Franklin Park, IL. (Assignee).
J. V. Sebelik, and W. Schaefer.
U.S. Patent No. 4,108,768, 6 p, 2 fig, 1 tab, 7 ref; Official Gazette of the United States Patent Office, Vol 973, No 4, p 1819, August 22, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, Water pollution treatment, Industrial wastes, Flocculation, Separation techniques, Laundering.

An industrial waste water containing hexane soluble impurities is adjusted in pH to a value of a least 11.6 and thereafter calcium chloride is added to that waste water in an amount of at least 1,700 parts per million, based on the total weight of industrial waste water. A metal hydroxide floc results which includes a substantial portion of the hexane soluble impurities attached to or incorporated in the floc. The floc can be agglomerated with conventional coagulants and then separated from the clarified waste water. The calcium chloride will react at this very high pH to effectively flocculate a substantial portion of the oils and greases (hexane solubles) in addition to a substantial portion of the contaminating metal ions in the industrial waste water. (Sinha-OEIS)
W79-02312

PROCESS FOR REDUCING THE MERCURY CONTENT OF INDUSTRIAL WASTE WATERS,
Hoeschst A. G., Frankfurt am-Main (West Germany). (Assignee).
M. Krieg, and T. Olffers.
U.S. Patent No. 4,108,769, 6 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 973, No. 4, p 1819-1820, August 22, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, *Mercury, Ion exchange, Chemical reactions, Chemical precipitation, Separation techniques, Filtration.

The invention deals with the reduction of the mercury content of industrial waste waters, especially those from a chlorine-alkali electrolysis using the amalgam process. All mercury present in the waste water is converted to the form of Hg^{++} ions by adding chlorine. Subsequently Fe^{++} ions are added. The pH of the solution is raised until a redox potential of from -0.1 to -0.8 volts, relative to the normal hydrogen electrode, is obtained. The mercury precipitated and the iron oxide hydrate formed may be filtered from the waste water. Residual mercury contents in the filtrate of about 50 mg/cu m may be obtained. (Sinha-OEIS)
W79-02313

METHOD FOR TREATING A MEDIUM CONTAINING WATER WITH COAGULANTS,
W. Vogel.
U.S. Patent No. 4,110,209, 6 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2309, August 29, 1978.

Descriptors: *Patents, *Waste water treatment, *Water treatment, *Water purification, Water pollution treatment, *Coagulation, Flocculation, Mixing, Chemical precipitation, Separation techniques.

A method for increasing the chemical efficiency of precipitating agents having a metal base in the treatment of water, waste water or sludge is described. The medium to be treated is initially conducted by pressure into a mixing cell where it is mixed in free turbulence with a precipitant solution and caused to react to form a reaction mixture containing flocs. The reaction mixture is conducted into a separating basin in which the flocs are removed from the clear water. (Sinha-OEIS)
W79-02322

PROCESS FOR THE PREPARATION OF A SUBSTANTIALLY HOMOGENEOUS LIME WATER SOLUTION,
S. A. Henrikson.
U.S. Patent No. 4,110,211, 6 p, 3 fig, 9 ref; Official Gazette of the United States Patent Office, Vol. 973, No. 5, p 2310, August 29, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, Water pollution treatment, Separation techniques, Flocculation, Lime, Equipment.

In the preparation of homogeneous lime water solution for use in the purification of waste water, a lime water suspension is used as starting material. The lime water suspension is supplied at the bottom of a compartment where it is caused to rise. It passes lamellas (baffles) during its upward movement. The lamellas are arranged in such a way that they create a sludge zone in the lower part of the compartment where the rising lime suspension is filtered. The lamellas create a clarification zone at the upper part of the compartment where the fine particles are separated. (Sinha-OEIS)
W79-02323

METHOD OF TREATING A WASTE LIQUID CONTAINING POLLUTING COMPOUNDS,
D. Krofchak.
U.S. Patent No. 4,110,212, 5 p, 6 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2310, August 29, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, Chemical reactions, Waste disposal, Solid wastes, Hydrogen ion concentration, Landfills, *Chemical precipitation, Inert precipitates.

Waste water containing polluting compounds is mixed with an acidic ferrous salt solution to adjust the pH of the liquid to a value within the range of from about 2 to about 5 and to reduce polluting compounds in the waste water to a form capable of reacting with an alkali to produce a precipitate. The adjusted waste water is then reacted with an alkali to raise the pH of the liquid to a value within the range of from about 9 to about 12.5 and to produce the precipitate. The alkaline waste water is then reacted with a silicic compound to form large complex silicate molecules with the precipitate and consequent solidification of the waste water into a stable, non-polluting solid, which may be used as land fill or road foundations. (Sinha-OEIS)
W79-02324

DRAINAGE DEVICE FOR PARTICULATE MATERIAL,
South African Block and Concrete (Pty) Ltd., Alberton. (Assignee).
J. B. Pfeffer.
U.S. Patent No. 4,110,214, 8 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2311, August 29, 1978.

Descriptors: *Patents, Water pollution treatment, *Waste water treatment, *Suspended solids, Separation techniques, Solid wastes, Equipment, *Drainage devices.

A drainage device comprising a bucket wheel has circumferentially spaced foraminuous buckets. In operation, when the bucket wheel rotates, the buckets in succession scoop out quantities of liquid having solids in suspension. The liquid drains away and the solids remain in the buckets and are later discharged before the buckets enter the liquid again. Rotation of the wheel about its axis takes place in arcuate steps by the operation of a pair of axially spaced plunger and cylinder assemblies engaging alternately in cyclic fashion with shoulders circumferentially spaced about the wheel axis. The number of steps per revolution may lie within the range of ten to forty inclusive. (Sinha-OEIS)
W79-02326

LIQUID LEVEL CONTROL SYSTEM FOR SEPARATION TANK,
Sun Oil Co., Philadelphia, PA. (Assignee).
D. A. Bramlett.
U.S. Patent No. 4,110,215, 7 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2311, August 29, 1978.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, Industrial wastes, Sepa-

ration techniques, Flow control, Water level, *Weirs, Equipment.

Separation tanks are often used to separate pollutants from waste water discharges from industrial processes before the water is permitted to be discharged into a natural body of water. One aspect of the separation tank operation which relates to its efficiency for controlling the quality of the effluent water is the maintenance of the liquid level within the tank within predetermined tolerances. This inventions provides a automatic liquid level controller for a separation tank. The automatic liquid level control system includes an external stilling well mounted on the side of the separation tank and having a liquid level sensing means which produces a pneumatic signal to the liquid level. A pneumatic operator receives the pneumatic signal and maintains the proper position of the weir gate in the weir or outfall box of the separation tank, so that the amount of effluent water flowing from the tank is appropriately regulated to maintain the desired liquid level in the tank. POLYQUATERNARY COMPOUNDS FOR THE CONTROL OF MICROBIOLOGICAL GROWTH,
Chemed Corp., Cincinnati, OH. (Assignee).
S. A. Shair, S. N. Paul, and J. E. Cairns.
U.S. Patent No. 4,111,679, 4 p, 3 tab, 6 ref; Official Gazette of the United States Patent Office, Vol. 974, no 1 P 293 September 5, 1978.

Descriptors: *Patents, *Industrial water, *Waste water treatment, Water quality control, Organic compounds, Microorganism, Slime, Bacteria, Fungi, Algae, Polyquaternary amines.

The method for controlling microorganisms in industrial cooling water systems comprises adding to the system a microbiocidal amount of a polyquaternary amine. The polyquaternary amines appear to be effective in controlling a broad range of bacteria, fungi, and algae, over a wide pH range, and at low dosages. The invention is of particulr value in slime control in industrial applications, such as air conditioning units, cooling water systems, etc. (Sinha - OEIS)
W79-02331

FILRATION SYSTEM,
Canplan Filtration Ltd., Halifax (Nova Scotia).
J. Jay, G. D. Bonner, and O. J. Betancourt.
U.S Patent No. 4,111,801, 12 p, 8 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 328-329, September 5, 1978.

Descriptors: *Patents, *Oil pollution, *Waste water treatment, Water pollution treatment, Industrial wastes, *Filtration, Water quality control, *Bilge water, Oil recovery, Plastic foam.

Methods and apparatus for filtering liquids such as oil contaminated water includes spaced apart supply and take-up reels capable of storing an elongated compressed ribbon of flexible open cell foam. In operation the ribbon of filtering medium, in the uncompressed state, extends between the reels across a support such as a grid or screen which permits free flow of water through the filter medium. The contaminated water is supplied to the upper side of the filter medium through a system which evenly distributes the contaminated water. The water passing through the filter medium may be collected in a suitable tank or basin. When the exposed section of filter medium becomes so loaded with contaminants (such as oil) that the flow through the filter decreases, the ribbion is advanced to expose a fresh sectin. Means are provided for compressing the contaminated ribbon to extract the oil before it is wound up on the take-up reel. The recovered oil is directed to a receptacle. Both the supply and take-up reel are provided with compression means which assist in compressing the ribbon of filter thereby contributing greatly to the compactness of the overall system. (Sinha-OEIS)
W79-02332

PROCESS FOR RECOVERING PROTEINACEOUS MATTER FROM ACID WHEY AND TANNERY UNHAIRING EFFLUENTS,
Department of Agriculture, Washington, DC. Office of the Secretary. (Assignee).
R. E. Townend.
U.S. Patent No. 4,111,803, 3 p, 1 tab, 7 ref; Official Gazette of the United States Patent Office, Vol 974, no 1, p 329, September 5, 1978

Descriptors: *Patents, *Water pollution, *Industrial wastes, Separation techniques, Chemical wastes, Tannery wastes, Dairy industry, Proteins, Amino acids.

Tannery unhairing waste and acid whey are mixed in proportions containing from 20 to 40% by volune of the tannery waste to spontaneously precipitate proteinaceous matter from both waste effluents and leave a relatively clean supernatant liquid. When the mixture is warmed to about 70C, all macromolecular components are quatitatively precipitated. (Sinha - OEIS)
W79-02334

GRAVITATIONAL SEPARATOR FOR MIXTURES OF IMMISCIBLE LIQUIDS OF DIFFERENT DENSITIES,
National Marine Service, Inc., St. Louis, MO. (Assignee).
D. A. Wright, and C. H. Walters
U.S. Patent No. 4,111,806, 9 p, 4 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 330, September 5, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water quality control, Waste water treatment, Separation techniques, Equipment, Density, Coalescence, Bilge water, Gravity separation, Backflushing.

An improved gravitational separator for mixtures of immiscible liquids of different densities, particularly oil and water, includes a reaction member in the form of a dome or diaphragm immersed in more dense liquid to be separated and which floats upwardly under the influence of liquid of less density accumulated beneath the dome or diaphragm. A coalescer screen filter system is provided in the water outlet path in the separator, the coalescer screens being contained in a chamber provided with automatically operating, one-way, pressure responsive valves to ensure proper flow of water in a forward and backflush sense through the chamber. A flotation feature for the reaction member is provided, and the reaction member includes an auxiliary air chamber to prevent loss of a minimum desired residual layer of less dense fluid beneath the reaction member when air accumulates in this area. A specific inflow and outflow conduit arrangement is provided to carry backflushed oil from the coalescer to the inlet conduit of the separator. (Sinha-OEIS)

SCANNING APPARATUS FOR SEPTIC EFFLUENTS,
Environmental Devices Corp., Marion, MA. (Assignee).
W. B. Kerfoot, and E. C. Brainard, II.
U.S. Patent No. 4,112,741, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 974, No 2, p 643, September 12, 1978.

Descriptors: *Patents, *Water pollution, *Monitoring, Measurement, Sampling, Instrumentation, Subsurface waters, Subsurface drainage, Water quality control, Effluents.

A continuously operative sample intake is traversed along the shoreline at a preselected subsurface level appropriate for picking up effluents emanating from on-shore septic systems. The conductivity and the fluorescence of the sampled water are measured continuously, the wavelength of the fluorescence measured being chosen to determine the presence of aromatic hydrocarbons and detergent whiteners which are present in distinctive proportions in recharged septic effluents. Signal processing means are incorporated for generating an output signal which varies as a function of the conjoint deviation of the two measurements from the values which are representative of background levels. (Sinha-OEIS)
W79-02340

WASTE WATER RECLAMATION APPARATUS,
J. B. Lajeuness.
U.S. Patent No. 4,112,972, 4 p, 4 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 974, No 2, p 722, September 12, 1978.

Descriptors: *Patents, *Waste water(Pollution), *Water reuse, Water utilization, Irrigation water, Reclaimed water, Impaired water use, Equipment, Valves

The object of this invention is to collect waste water from selected sources and distribute it to selected outlets. A conduit arrangement is provided which is coupled to selected sources of waste water whereby the water is collected into a storage container and held in the container pending demand distribution of the waste water into selected outlets such as for lawn and plant irrigation purposes. Means are provided for gravity flow of the waste water through the system and a diverter valve is included for separating 'gray' water from the conventional black water sewer system. This one-piece device also maintains proper sewer functioning in its open position by allowing atmospheric pressure to reach downstream backflow from reaching the diversion. In the open position, it is 100% efficient with normal flow, with peak flow it has an efficiency of about 90%. In the closed position, it maintains the original drain and sewer function. (Sinha-OEIS)
W79-02341

GREASE SEPARATOR,
F. P. Bereskin, and J. J. Borowczyk.
U.S. Patent No. 4,113,617, 7 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 974, No 2, p 934, September 12, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Separation techniques, Cooling, Equipment, *Grease traps, F.O.G.(Fats oils, greases).

A grease separating system includes four successive chambers. The heated, emulsified grease is passed through a solids retention box into an inlet chamber where cool water is sprayed onto the emulsified grease. This mixture is passed through a connecting chamber, and then over baffles at the entrance of a collection chamber. The grease having been separated from its emulsified state rises to the top of the mixture in the collection chamber, and the water passes into a discharge chamber and in to the connected sewer system. After successive operations, the floating grease is sensed when it reaches a predetermined level, and an alarm is sounded to indicate that the accumulated grease should be removed. (Sinha-OEIS)
W79-02342

WASTE FLUID TREATMENT SYSTEM,
Arrington Co., Inc., Muskego, WI. (Assignee.
J. R. Arrington.
U.S. Patent No. 4,113,619, 6 p, 2 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 974, No 2, p 935, September 12, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, *Chemical reactions, Mixing, Safety, Equipment, *Cyanides, *Metal plating industry

A system for chemically treating waste water includes a storage tank, a recreation tank, and a

pump for transferring the waste water from the storage tank to the reaction tank. Conduits connecting the pump to the tank and control valves controlling the flow through the conduits are arranged so that, by coordinated actuation of the valves, the pump recirculates the waste water through the reaction tank to provide intermixing of the treatment chemicals and discharges the waste water from the reaction tank after treatment. The chemical reagents are introduced into the system on the suction of the pump so that gravity feed or separate pumping means is not required for the reagents. The tanks are preferably circular and mounted in a spaced relationship on a common base. Equipment for controlling the operation of the pump, the control valves, and the addition of the reagents are carried on a control panel. (Sinha-DEIS)
W79-02343

PLANNING AND STARTUP OF A FLEXIBLE ACTIVATED SLUDGE INSTALLATION (BIO-FLEX PROCESS) AS A BIOLOGICAL CLARIFICATION STAGE IN A BOARD MILL (PLANUNG UND INBETRIEBNAHME EINER FLEXIBLEN BELEBTSCHLAMMANLAGE (BIO-FLEX-VERFAHREN) ALS BIOLOGISCHE KLAERSTUFE EINER KARTONFABRIK),
Kartonfabrik Buchmann GmbH., Rinnthal (West Germany).
G. Renz.
Wochenblatt fuer Papierfabrikation, Vol. 106, No. 20, p 359-362, May 31, 1978. 5 fig, 1 illus, 3 ref, 3 tab.

Descriptors: *Biological treatment, *Waste water treatment, *Pulp wastes, *Board mills, Wastes, Industrial wastes, Water pollution treatment, Waste treatment, Water polluton sources, Activated sludge, Biochemical oxygen demand, Chemical oxygen demand, Sludge, Costs, Pulp and paper industry, Planning, Treatment facilities, Operation and maintenance, Water purification, Water pollution control.

Adding a biological clarification stage to an existing installation requires the establishment of a favorable ratio of water volume to concentration of impurities. As the water cycle approaches closure, the impurity concentration rises but the daily load is somewhat reduced. Using a modified activated sludge unit, satisfactory BOD and reduced COD were obtained. Advantages of this installation are a reliable operation at various pollution loads, properties of the activated sludge, and the low sludge index. The cost of the installation is low compared to figures given in the literature. (Ward-PC)
W79-02361

SCREENING -- A NOVEL APPROACH TO PRIMARY TREATMENT,
Combustion Engineering Inc., Brantford (Ontario). C-E Bauer Div.
J. G. Phillips.
Water and Pollution Control, Vol. 116, No. 5, p 44-45, May/June, 1978. 3 illus.

Descriptors: *Pulp wastes, *Waste water treatment, *Screens, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp and paper industry, Costs, Economics, Effluents.

The use of static screens for primary effluent treatment is increasing, because they are inexpensive to install and operate and require limited floor space. The C-E Bauer Hydrasieve screen is one type of vertically mounted static screen that is available for the removal of solids. Although this screen was designed to thicken slurries in the pulp and paper industries, it has become widely accepted in the handling of various industrial waste waters. The screen is a pretreatment or primary treatment device, removing solid matter to create an effluent more readily treatable with existing equipment. A hydrasieve screen can be installed for approximately 25-35% of the cost of a primary clarifier. (Louden-IPC)

OPERATION OF THE (EFFLUENT) PURIFICATION EQUIPMENT AT THE RAZLOG PULP AND PAPER MILL (OPIT OT RABOTA NA PRECHISVATELNATA STANTSIYA KEM KTSKH RAZLOG),
L. Torbin, K. Stoichkov, and V. Tumbeva.
Tseluloza i Khartiya, Vol. 8, No. 6, p 24-26, 1977. 1 fig, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Operation and maintenance, *Treatment facilities, Wastes, Industrial wastes, Waster treatment, Water pollution treatment, Water pollution sources, Foreign countries, Activated sludge, Pulp and paper industry, Effluents, Biological treatment, Biochemical oxygen demand, Sludge, Oxidation, Municipal wastes, Soviet Union(USSR).

The effluents of the Razlog pulp and paper mill (USSR) are treated jointly with the town's sewage by the activated sludge process. The treatment plant includes a mechanical purification line for the sewage, a mechanical purification line for the mill effluents (spent liquors and fiber-containing effluents), a blending tank where the two are mixed, and a biological purification line. According to specifications, a BOD reduction of 15% should occur in an aerated 7,560 cu m capacity blending tank. In practice, the BOD reduction was only 12%. In an attempt to improve the biological oxidation in the system, activated sludge was added to the blending tank to give a concentration of 150-200 mg/liter. The results of this modification were: a prolongation of the contact time of the sludge with the effluents; an increase of BOD reduction in the blender from 12 to 34%; and a reduction of the BOD load in the aeration tanks. Presently, the biological oxidation process has become a two-stage process, the blending tank operating as a mixer and aeration tank. (Stapinski-IPC)

Technik und Umweltschutz, Vol. 13, p 168-175, 1976. 17 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated sludge, Wastes, Industrial wastes, Water pollution treatment, Water pollution sources, Waste treatment, Pulp and paper industry, Effluents, Sulfite liquors, Biological treatment, Color, Biochemical oxygen demand, Chemical oxygen demand, United States, Foreign countries, Europe, Treatment facilities, Poland, Kraft mills.

Following brief descriptions of five United States and three Polish pulp mill effluent treatment installations, the composition of waste waters from sulfite and sulfate (kraft) pulping are compared. Also discussed are the advantages and disadvantages of biological purification of pulp mill effluents and the use of semitechnical studies as a basis for the selection of treatment plant parameters. The activated sludge process is the main process used in treating kraft mill effluents, being superior to other known processes with respect to purification capacity and economy. However, this process is not particularly effective in reducing color. Typical data for an activated sludge plant include a 5-day BOD reduction of 86.9%, a COD reduction of 51.4%, and a color reduction of 20.0%. (Speckhard-IPC)

At the Verkhotursk wood chemical plant (USSR) the effluents are discharged jointly with sewage into two storage ponds (75 cu m capacity each). A study was made to determine the degree of biological purification occurring in these nonaerated ponds. Preliminary laboratory experiments indicated substantial reductions of BOD and COD if the effluent is neutralized (to pH 7.4-7.6) and nutrients are added. Such a treatment was applied to the effluents prior to discharge into the ponds, and samples were analyzed over a period of two summer months. The BOD and COD reductions during this period were 72 and 68.6%, respectively. (Stapinski-IPC)

Descriptors: *Pulp and paper industry, *Rayon, *Water pollution control, *Chemical oxygen demand, *Biochemical oxygen demand, Foreign countries, Europe, Water pollution sources, Pulp wastes, Sulfite liquors, Effluents, Water pollution, Austria, Sulfite pulp mills.

Chemiefasern Lenzing AG. (Austria) produces 80,000-100,000 tons of rayon fiber/year and incorporates a sulfite pulp mill producing 100,000-110,000 tons/year. The integrated mill also includes a plant for manufacturing sulfuric acid as well as facilities for producing synthetic fibers, paper, plastic films, and lumber. The development of effluent treatment operations at the mill over the last 20 years is reviewed. Pollution control measures have included switching to magnesium-base sulfite pulping using the mill's own patented process. The biological degradability of bleaching effluents has been studied, but a satisfactory process for treating them has not yet been found. The present daily effluent load from the pulp mill amounts to 80,000 cu m, incorporating 45 tons of dissolved organic substance, 95 tons of COD, and 28-30 tons of 5-day BOD. Corresponding figures for the viscose rayon operation are 25,000 cu m, 20 tons COD, and 7.5 tons BOD. (Speckhard-IPC)

Descriptors: *Pulp and paper industry, *Waste water treatment, *West Germany, Water pollution sources, Wastes, Industrial wastes, Waste treatment, Biological treatment, Effluents, Biochemical oxygen demand, Chemical oxygen demand, Economics, Research and development, Water pollution treatment, Foreign countries, Europe, Sewage treatment.

Data are reviewed concerning the pollution load of pulp and paper mill effluents in West Germany, and the development of effluent treatment measures is outlined. Emphasis is on mechanical and biological clarification of paper mill effluents. About one-fifth of the paper mill effluent in West Germany is presently being subjected to secondary biological clarification, the BOD load normally being reduced by more than 90% and the COD load by 70-90%. New clarification techniques (adsorption, oxidation, electroflotation, electrodialysis, electrolysis, chemical precipitation, reverse osmosis, ion-exchange, gamma-irradiation, evaporation, freezing) appear to be too expensive for use in processing paper mill effluents. (Speckhard-IPC)

Descriptors: *Pulp wastes, *Waste water treatment, *Electrochemistry, *Oxidation, Water pollution treatment, Waste treatment, Water pollution sources, Wastes, Industrial wastes, Pulp and paper industry, Electrodes, Chemical oxygen demand, Color, Phenols, Lignins, Hydrogen ion concentration, Electric currents, Lead, Titanium, Graphite.

The electrochemical oxidative purification of kraft pulping effluents was investigated on effluents after biological purification but prior to chemical purification, on black liquor, on bleach plant effluents following the first alkali, extraction stage, and on condensates from evaporation units. Various materials (lead, titanium, graphite) were used as electrodes. Depending on the electrode material, on electroconductive additives, and on effluent composition, the purification achieved 65.5-87.0% reduction of COD, 40-99.5% removal of color, and 78-100% elimination of phenolic content. Lignins were completely removed from the effluents. Data on the effects of current density, pH, and electrode material on the degree of purification of the various effluents indicated that increasing current density up to 2-4 amp/sq dm sharply reduced the COD. The effect of pH was complicated, but the best pH using lead electrodes was 7-9. In spite of consuming a large amount of electrical energy, this method could become important for closed systems if electrical energy becomes cheaper. (Chern-IPC)

Foam control in aeration tanks at the Syava wood chemical plant (USSR) is achieved with sprinklers. Because of inadequate control and clogging of the sprinkler nozzles, a study was made to determine the foam control efficiency of several chemical agents. These included turbine oil, axle oil, solar oil, four commercial antifoam agents, synthetic aliphatic alcohols (5.8, 7-12, and 10-18 carbon fractions), and the distillation residue of the 7-9 carbon fraction. The alcohols were effective, their effectiveness increasing with increasing molecular weight. The distillation residue was the most effective. The alcohols and the distillation residue were tested for their toxicity to the activated sludge microflora and their effect on the biological oxidation process. They were found to be nontoxic and to have no effect on oxidation. The use of the distillation residue for foam control at wood chemical plants (silvichemical factories) is recommended. PARTIAL CHARACTERIZATION OF CHLORINATED ORGANICS IN SUPERCHLORINATED SEPTAGES AND MIXED SLUDGES,
Municipal Environmental Research Lab., Cincinnati, OH
R H Wise, T A Pressley, and B M Austern
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 529, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/2-78-020, March 1978. 29 p, 1 fig, 5 ref.

Descriptors: Pollutant identification, *Waste treatment, *Sludge treatment, *Chemical analysis, *Chlorination, *Inorganic compounds, *Organic compounds, *Laboratory tests, Septages, Sewage treatment, Sludge disposal, Chemical reaction, Organic wastes, Organic matter, Liquid wastes, Schoniger-flask combustion, Septic tanks

The chlorinated organic materials produced by the Purifax process, a method for superchlorinating concentrated biological wastes to stabilize them, was studied to determine which types of chlorinated organics it produces, how such compounds are likely to be discharged, and the amount of liquids and or solids produced. Purifaxed samples of septage and mixed primary/secondary sludges were separated into solid and liquid phases, and analyzed for their chlorinated organic content. Total organic chlorine in the solid phases were determined by Schoniger-flask combustion. Both solid fractions contained 0.9% to 1.0% total organic chlorine, based on dry weight. Concentrated hexane-ether extracts of the liquid phases were analyzed for total organic chlorine by microcoulometric titration, and then analyzed by GC/MS for individual organic compounds. GC/MS analysis of the hexane-ether extracts and the helium-purgable, volatile organics in the unextracted phases yielded slighly higher concentrations of the same kind of organic compounds typically present in U.S. water supplies. Cyanogen chloride was present in all of the unextracted Purifax liquid phases in concentrations reaching 900 micrograms/l. It is recommended that the gaseous phase of the Purifax process which is discharged from the reactor along with the solid and liquid phases, be analyzed. (Davison-IPA)

Descriptors: *Storm runoff, *Pollution abatement, *Sewers, *Water pollution sources, *Storm water treatment, Drainage systems, Storm drains, Urban drainage, Storm water, Separated sewers, Surface runoff, Storage, Storm water storage, Sewage treatment, Storm water quality, Sewage bacteria, Overflow, Waste water treatment, Flow control.

The combined sewer overflow pollution problem is viewed as a reflection of the inefficiencies inherent in the collection, transport, and treatment systems. The entire sewage system must be evaluated prior to the planning of modifications to provide the capability to adequately control and treat waste waters during and immediately following storms. Applicable solutions involve control facilities such as in and off-system storage, flow regulation and routing, remote flow-sensing and control coupled with treatment. Physical, chemical, biological and physical-chemical treatment methods are under investigation, with a screening dissolved-air flotation process and a high-rate multi-media filtration process offering the best current potential for producing good quality effluents. WASTEWATER TREATMENT TECHNOLOGY DOCUMENTATION FOR TOXAPHENE MANUFACTURE,
Midwest Research Inst., Kansas City, MO.
A. F. Meiners, C. E. Mumma, T. L. Ferguson, and G. L. Kelso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 676, Price codes: A07 in paper copy, A01 in microfiche. Final Report No EPA-440/9-76-013, February 1976. 136 p, 16 fig, 10 tab, 53 ref, 2 append. MRI 4127-C. 68-01-3524.

Descriptors: *Waste water treatment, *Insecticides, *Toxaphene, *Industrial wastes, *Pesticides, Adsorption, Sedimentation, Activated carbon, Reduction degradation, Effluents, Pollutants, Estimated costs, Cost comparisons.

Toxaphene, produced by chlorination of camphene, with the resulting by-product of hydrogen chloride, is manufactured by four companies in the U.S.: Hercules, Inc., Tennaco Chemicals, Inc., Riverside Chemical Company, and Vicksburg Chemical Company. Current waste water management practices of the toxaphene industry and potential waste water treatment processes applicable to this industry are examined; a selection of those processes applicable to the Environmental Protection Agency's (EPA) toxic pollutant control technology requirements are discussed. The four toxaphene producing plants and their water treatment methods are characterized. The alternate systems considered for removing toxaphene from waste water are: (1) adsorption on synthetic resins, (2) reductive degradation, and (3) carbon adsorption. The systems have not been operated under conditions approximating actual use for toxaphene removal, and they have not been developed so that an accurate determination of costs or operating conditions can be made. A comparison of the effluents produced by the alternate treatment systems with the EPA guidelines with regard to Levels I, II and III technology is presented. Waste water treatment cost estimates, based on capital investment costs and annual operating costs, are discussed for currently used toxaphene waste water treatment, and for alternate waste water treatment systems. (Davison-IPA)

ASSESSMENT OF HAZARDOUS WASTE PRACTICES IN THE PETROLEUM REFINING INDUSTRY,
Jacobs Engineering Co., Pasadena, CA.
D. G. Rosenberg, R. J. Lofy, H. Cruse, E. Weisberg, and B. Beutler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 097, Price codes: A16 in paper copy, A01 in microfiche. Final Report No SW-129c, June 1976. 367 p, 23 fig, 140 tab, 57 ref, 15 append. 68-01-2288.

Descriptors: *Waste treatment, *Oil wastes, *Industrial wastes, *Hazardous wastes, *Cost analysis, Anaerobic digestion, Lagooning, Incineration, Landfills, Land spreading, Chemical analysis, Waste analysis, Disposal, Metals, Organic wastes, Sludge treatment.

A study was conducted: (1) to determine the nature, quality, and projected future quantity of potentially hazardous wastes generated by the petroleum refining industry in the U.S.; (2) to evaluate current waste management practices; (3) to examine improved technologies for waste treatment and disposal, the application of which would result in future reduction of waste hazard; and (4) to calculate the costs for three levels of waste treatment and technology. The industry is characterized in terms of refining processes employed, and future trends in petroleum refining and waste management are discussed. A total of 14 trace elements were selected for identification and measurement in refinery waste streams. Potentially hazardous organic compounds were too numerous for individual analysis; therefore, oil represented a composite of hazardous organic substances, and all refinery samples were analyzed to determine their constitutent percentages of oil water and solids. At the present time, 63% of refinery wastes are disposed of by landfilling, 28% by lagooning, 7% by landspreading and 2% by incineration. It is projected that recycling and reclamation of materials used in refining will increase, and that off site landfill disposal and lagooning will decrease; landspreading will increase. The cost to industry for waste treatment/disposal using three levels of technology varies from $1.80 to $260.93 metric ton with maximum 1974 costs estimated to be $54,216,000. Implementation of Level II or Level III technology can be achieved as an estimated cost to industry to $74,049,000. (Davison-IPA)

WASTEWATER TREATMENT TECHNOLOGY DOCUMENTATION FOR DDT MANUFACTURE,
Midwest Research Inst., Kansas City, MO.
A. F. Meiners, C. E. Mumma, T. L. Ferguson, and G. L. Kelso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 013, Price codes: A05 in paper copy, A01 in microfiche. Final Report No EPA-440/9-76-009, June 1976. 99 p, 7 fig, 8 tab, 38 ref, 1 append. MRI-4127-C. 68-01-3524.

Descriptors: *Waste water treatment, *Industrial wastes, *DDT, Acidic waters, Alkaline water, Solvent extractions, Cost analysis, Cost comparisons, Adsorption, Activated carbon, Synthetic resin.

The treatment of waste water resulting from the production of DDT by Montrose Chemical Corporation, the sole U.S. manufacturer of DDT, is examined. Alkaline waste water and acid waste water that results from the production process are presently hauled offsite by truck and disposed of in an approved class 1 California dump. Four alternative alkaline waste water treatment systems being considered for reducing the concentration of DDT and related compounds and the daily load are examined in detail. The four systems are: a solvent extraction/Friedel-Crafts method; a two-stage solvent extraction system; activated carbon adsorption; and synthetic resin adsorption. A summary of estimated costs for these selected alkaline waste water treatment systems is shown, and the concentration of DDT in the treated effluent is estimated. (Gibson-IPA)

BENZIDINE: WASTEWATER TREATMENT TECHNOLOGY,
Keinath (Thomas M.), Senaca, SC.
T. M. Keinath.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 024, Price codes: A07 in paper copy, A01 in microfiche. Final Report No EPA-440/9-76-018, June 1976. 131 p, 7 fig, 17 tab, 30 ref, 4 append. WA-6-99-1309-A and 68-01-3390.

Descriptors: *Waste water treatment, *Benzidine, *Industrial wastes, *Treatment facilities, Chemical industry, Cost analysis, Cost comparisons, Oxidation, Adsorption, Ozone, Nitrous acid, Activated carbon, Activated sludge, Biological treatment, Surveys, On-site investigations.

Information is provided on: (1) the occurrence of benzidine in the waste waters of synthetic organic chemical manufacturing facilities; (2) the occurrence of benzidine in the waste waters of benzidine-based dye users; (3) prospects for no aqueorus discharge; (4) applicable waste water treatment technology; and (5) to establish the effect of benzidine on publicly owned waste water treatment facilities. Material was gathered, in part, through a questionnaire survey and personal visits to benzidine-based dye manufacturers and applicators. Results indicate that: (1) available manufacturers' housekeeping measures are adequate to prevent the discharge of benzidine directly to process lines; (2) benzidine in waste water can effectively be treated by oxidation with nitrous acid and ozone and adsorption with granular activated carbon, however, costs vary; and (3) pretreated benzidine will not adversely affect municipal biological waste water treatment systems. (Gibson-IPA)

ADSORPTION OF POLIOVIRUS TYPE I TO WASTEWATER TREATMENT PLANT SOLIDS,
California Univ., Los Angeles. Dept. of Chemical, Nuclear and Thermal Engineering.
R. S. Kamdar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 312, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, 1978. 109 p. 10 fig, 9 tab, 58 ref. (California Water Resources Center Project UCAL-WRC-W-523). OWRT B-184-CAL(1).

Descriptors: *Viruses, *Waste water disposal, *Waste water treatment, Isotherms, Adsorption, *Poliovirus Type I, Solid wastes, Cations.

The association of poliovirus type 1 (CHAT), a human enteric virus, to solid products of the secondary wastewater treatment process was investigated. These studies have demonstrated a fraction of the total poliovirus present became associated with the solids. The solids-associated viruses retained their infectivity in the tissue culture monolayer; therefore, the association of virus with solids cannot be equated to inactivation. Most of the associated virus can be eluted from the solids in viable form. Thus, the process is reversible. Most of the association of virus to the solids occurred rapidly within the first five minutes of the contact period. Association was enhanced markedly in the

presence of metal cation. Sonication of the solids sample increased the association. The association of poliovirus to wastewater solids is an adsorption process and conforms to the Freundlich isotherm, an empirical relation described by $q = u\ Cen$ where q is the number of viruses adsorbed per unit mass of solids, Ce is the virus concentration remaining in solution at equilibrium, and u and n are empirical constants. The range of virus concentration used was 10 to the fifth power to 10 to the eighth power PFU per liter. Solids concentration studied varied from 20 to 4800 mg/l. (Snyder-Calif, Davis)

Descriptors: *Farm wastes, Waste management, Hogs, Nutrient recovery, *Proteins, Algae, *Proteins, *Recycling.

A system is described for recycling nutrients contained in animal manure by growing algae using the digested waste as a substrate. The most encouraging aspect of the studies described has been the stability of the Chlorella vulgaris 211/8K cultures growing in fresh swine manure diluted to an ammonium nitrogen content of 250 mg/liter. Further dilutions reduced the growth rate. Manure solutions with higher nitrogen concentrations were not tested. Clarification of the manure by filtration through activated carbon or ferric chloride flocculation improved the light transmission dramatically. However, the algal growth rates were substantially lower in the clarified solutions. The superiority of the untreated swine manure was attributed to the higher organic matter content. It was suggested that the organic matter provides CO2 for algal photosynthesis by acting as a substrate for growth of bacteria. This observation was further substantiated by experiments in which CO2 was added to the cultures.

Descriptors: *Coasts, *Nutrients, *Waste disposal, *Ecosystems, Water quality, Organic wastes, Biochemical oxygen demand, California, *Bioenhancement, Fish processing wastes, Waste management.

Coastal marine waters, among the richest ecosystems in existence, are largely dependent upon nutrients of terrestiral origin. Where man has reduced or eliminated marshlands and river flow, urban sewage systems offer virtually the only nutrient source for sustaining diverse marine life. Studies at Terminal Island, California indicate that domestic sewage and fish-processing effluents supplied large organic molecules (proteins, amino acis, carbohydrates and fats) which enhanced the environment as they were recycled through the food chain or web. Methods were being developed for managing the levels of oxygen demand in the waste load, according to the assimilation capacity of the receiving waters, rather than destroying the nutrients by feeding only bacteria to secondary waste-treatment plants. The residual nutrients in the wastes after secondary treatment do not support the same diverse ecosystem, and depletion of after secondary treatment do not support the same diverse ecosystem, and depletion of biota may result. Rather, emphasis should be placed on point-source control and removal of toxicants without depriving the coastal organisms of their historic nutrient supply. In the future, energy-rich effluents should be used by developing alternative methods for waste management and new regulatory concepts, rather than imposing traditional secondary treatment. (NOAA)

Descriptors: Dredging, Spoil, Channel improvements, Islands, Water circulation, Turbidity, Hydrography, Bathymetry, Tides, Streamflow, Wind, Sediment sampling, Sediment transport, Cores, Size, *Waste disposal, *Dredge spoil disposal, Gulfport(Miss), *Mississippi, *Mississippi Sound(Miss).

The disposal of 26.6 million cubic yards of dredged material to be removed during the proposed Gulfport Harbor expansion is the basis for studying existing dredge spoil deposits in Mississippi Sound and the physical processes acting upon these deposits. Sediment analysis of cores from dredge spoil near Gulfport was performed to determine physical properties of the spoil and to determine direction of sediment transport. Bathymetric data, tide data, wind data, streamflow data, current velocities, current directions and turbidity patterns from LANDSAT photos were used in determining physical factors affecting circulation and sediment transport in the Sound. Data from this study indicates that maximum turbidity within the Sound occurs during periods of high discharge from the rivers entering the Sound. Additional turbid conditions are produced over shallow areas by tides and wind-driven waves. Dredge spoil cores contained layers of medium grained sand with higher percentages of clay to the north and northwest. Layering is thought to be due to addition of spoil to existing spoil bank. These data, coupled with a study of historical changes in the configuration of Round Island, indicate that erosion would occur on the south and east side of dredge spoil banks or islands. Submarine prolongation could be expected on the north and northeast side of such a deposit. Orientation of future dredge spoil with this prevailing direction of sediment transport should serve to improve stability and reduce both original and maintenance costs.

STRATIGRAPHY AND HYDROGEOLOGIC CORRELATION STUDIES IN SEVERAL CYPRESS DOMES-NORTH CENTRAL FLORIDA,
Florida University, Gainesville, Department of Geology
D. P. Spangler, D. P. Gillespie, and J. D. Lundy.
In: Third Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 110-128, 1976. 9 fig, 13 ref.

Descriptors: *Swamps, Stratigraphy, *Waste water disposal, Wetland, Geologic mapping, Hydrogeology, Groundwater, Florida.

A stratigraphic study of several cypress domes suggests their viability as depositories for secondarily treated wastes, particularly where the Hawthorn clays (aquiclude) is present. A secondary conclusion resulting from this work has been the relationship of hardpans, dolomites, and phosphates to domal areas. These relationships are best noted in several presented cross sections, particularly those containing natural gamma radiation logs. Tentative correlations are possible between these data and the gamma logs. Further study is indicated and needed to describe the origin, movement, and deposition of iron, manganese, calcium, magnesium, phosphate, uranium, and randon with respect to cypress domes and their underlying groundwater systems. HYDROLOGY OF THE AUSTIN CARY CONTROL DOME,
Florida Univ., Gainesville. Dept. of Geology; and Florida Univ., Gainesville, FL. Center for Wetlands.
D. Gillespie.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p. 129-156, 1976. 9 fig, 3 tab, 10 ref.

Descriptors: *Swamps, *Hydrogeology, *Geologic mapping, *Waste water disposal, *Stratigraphy, *Florida, Wetlands, Hydrologic properties, Water balance, Hydrologic budget, Water table, Waste water, Aquifers, Permeability

Hydrogeologic parmeters considered in examining the feasibility of using the Austin Cary Control cypress dome for water table management and recycling secondarily treated wastes include: permeability of the underlying materials, flow routes and rates of surface and or groundwater and ex-

change capacity or filterability of aquifers and aquicludes. Infiltration of treated wastes into the Floridan Aquifer is a main concern. Comparisons with two shallow aquifers and a secondary aquifer of the Hawthorn Formation reveals that recharge from surface waters and precipitation decreases with depth. The shallow surface aquifer is heavily influenced by surface water giving rapid responses. The shallow artesian aquifer is also influenced, but gives slower and diminished responses. Recharge to the secondary aquifer is minimal and shows a definite lag time. This is an indication that very little vertical groundwater movement would be expected down to the Floridan aquifer due to a thick sequence of impermeable clays separating it from the surface waters and precipitation. Descriptors: *Sludge treatment, *Pulp wastes, *Dewatering, *Heat treatment, Wastes, Industrial wastes, Sludge, Pulp and paper industry, Water pollution sources, Activated sludge, Biochemical oxygen demand, Color, Groundwood fines.

Heat treatment improved the filterability of groundwood fines and of waste sludges from the activated sludge treatment of pulp and paper mill waste waters. The improved filterability was related to the solubilization of volatile constituents up to an optimum solubilization of 40-60%. However, heat increased the BOD and color of the sludge filtrates. PERIMETER DIKE RAISING WITH DEWATERED FINE-GRAINED DREDGED MATERIAL AT UPPER POLECAT BAY DISPOSAL AREA, MOBILE, ALABAMA,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
T. A. Haliburton, J. Fowler, and J. P. Langan.
Miscellaneous Paper D-78-3, August 1978. 66 p, 2 tab, 23 fig, 8 ref.

Descriptors: *Dewatering, *Dikes, *Dredged material, *Waste disposal sites, *Fine grained soils, *Polecat Bay(Ala).

Use of dewatered fine-grained dredged material for large-scale perimeter dike raising was evaluated by a cooperative field demonstration between the U.S. Army Engineer District, Mobile, and the Dredged Material Research Program (DMRP) Disposal Operations Project (DOP) and Productive Uses Project. After conduct of the field demonstration, it was determined: (1) Fine-grained dredged material of high plasticity may be used successfully in large-scale dredged material disposal site perimeter dike-raising activities, once the material has been successfully dewatered with DMRP DOP-developed procedures. (2) The cost of dike raising with the dewatered fine-grained dredged material was less than estimated for use of offsite borrow, even though the demonstration site had good haul access. (3) Three different methods for dewatered dredged material borrow removal and three different methods for perimeter dike raising were evaluated and found to be technically feasible and operationally practical. Corps of Engineers field elements and other interested agencies should seriously consider the use of dewatered fine-grained dredged material for large-scale perimeter dike-raising activities, following the construction procedures described and evaluated in the report. Such construction may be extremely cost effective at remote locations where offsite borrow is particularly expensive. (WES)

AQUATIC DISPOSAL FIELD INVESTIGATIONS, ASHTABULA RIVER DISPOSAL SITE, OHIO; APPENDIX A: PLANKTONIC COMMUNITIES, BENTHIC ASSEMBLAGES, AND FISHERY,
State Univ. of New York Coll. at Buffalo. Great Lakes Lab.
R. A. Sweeney.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-42, July 1978. 330 p, 36 tab, 119 fig, 101 ref, 3 append.

Descriptors: *Aquatic environment, *Lake Erie, *Ohio, *Benthic fauna, *Benthic flora, *Plankton, Fish, Biota, *Dredged material disposal, *Waste disposal sites, *Ashtabula River(Ohio).

An investigation to evaluate impacts of the release of dredged material on phytoplankton, zooplankton, benthic macroinvertebrates, and fish was conducted in Lake Erie off Ashtabula, Ohio, from June 1975 through September 1976. Samples and measurements were taken prior to, during, and after the release of materials from a hopper dredge during August 1975 and May 1976. Pelagic biota (phytoplankton, zooplankton, and fish) along with primary productivity were only mildly impacted and recovery was relatively rapid. The benthic communities were altered with the decline of some species and introduction of new fauna transported from the dredged sites. Within a year species diversity had largely returned to predisposal levels. However, the community structures were slightly altered. These changes were similar to those noted in marine environments exposed to dredged material. (WES)
W79-02346

ABILITY OF SALT MARSHES TO REMOVE NUTRIENTS AND HEAVY METALS FROM DREDGED MATERIAL DISPOSA AREA EFFLUENTS,
H. L. Windom.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-37, December 1977. 100 p, 7 tab, 12 fig, 25 ref, 5 append.

Descriptors: *Salt marshes, *Nutrients, *Heavy metals, *Pollutants, *Effluents, *Dredged material disposal, *Waste disposal sites.

Experimental raceways were constructed in a salt marsh adjacent to a dredged material confinement area to evaluate use of this environment as an overland flow advanced treatment system for effluent resulting from dredged material disposal. The program was designed to determine the ability of salt marsh systems to remove nitrogen, phosphorus, iron, manganese, cadmium, copper, nickel and zinc from effluent. Application rates varied between 0.06 and 3.7 acre inches per day and concentrations of the contaminants were determined in the effluent from the disposal area and discharge from the experimental system. All contaminants were found to decrease in the effluent as it passed through the experimental raceways. Removal efficiencies for nitrogen and phosphorus varied up to 50 and 70 percent, respectively. Mean metal removal efficiencies ranged between 15 and 32 percent. Efficiency of removal appeared unrelated to application rate but did appear toincrease with concentration. Contaminants accumulated in sediments with only minor increases in salt marsh vegetation. Although resuls indicate nutrients and heavy metal concentrations in effluents from dredged material disposal areas can be reduced during passage through a salt marsh, conclusions about efficiency or removal may be influenced by the size of the experimental system used. (WES)

FLUME EXPERIMENTS ON SAND, SILT, AND CLAY MIXTURES FROM THE OFFSHORE DREDGED MATERIAL DISPOSAL SITE, GALVESTON, TEXAS,
Texas A and M Univ., College Station. Dept. of Oceanography.
A. J. Moherek.
Army Engineer Waterways Experiment Station,

Vicksburg, Mississippi, Technical Report D-78-34, June 1978. 204 p, 6 tab, 66 fig, 42 ref, 6 append.

Descriptors: *Texas, *Gulf of Mexico, *Flumes, *Sediment transport, *Dredged material disposal, *Waste disposal sites, *Galveston(Tex).

Flume experiments were performed on four sediment mixtures sampled from the offshore Galveston dredged material disposal site in order to determine their critical erosion velocity, shear stress, and modes of sediment transport. Also, and analysis of the offshore Galveston hydrographic regime was performed using meteorologic and oceanographic data. Results indicated the four sediment mixtures eroded similarly. Extapolation of flume results to recorded off-shore bottom current speed measurements indicate bedload erosion occurs much more frequently near the northern margin of the disposal site. Also, net bedload transport of disposal material is oriented down the coast or offshore from the disposal site, suggesting that material will not likely return to the channel proper as shoaling sediment. EXPERIENCE WITH DRUM DRYERS FOR ACTIVATED SLUDGE (OPYT NALADKI BARABANNYKH SUSHILOK AKTIVNOGO ILA),
D. A. Narinskii.
Bumazhnaya Promyshlennost', No. 4, p 30-31, April, 1978. 1 fig, 1 tab.

Descriptors: *Activated sludge, *Sludge treatment, *Drying, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Foreign countries, Pulp wastes, Pulp and paper industry, Sludge, Equipment, Drum dryers

Progress-brand drum dryers have been installed at several Soviet paper mills for drying excess activated sludge (dewatered on vacuum filters to 80-85% moisture content) to a moisture content of 30-40%. However, the standard nozzles did not break up the sludge sufficiently, resulting in a low drying efficiency. Progress-brand dryers installed at the Arkhangel'sk mill were studied and reconstructed. The reconstructed dryers operate satisfactorily: the dried sludge has a moisture content of 20-40%, and the dryer efficiency is 60-70 kg water/cu m/hr at a heat consumption of 950-1,000 kcal/kg of evaporated water. It is pointed out that the use of the dryers can be economically justified only if the dried sludge is subsequently burned with recovery of heat. (Stapinski-IPC)

HAZARDOUS WASTE DISPOSAL DAMAGE REPORTS, DOCUMENT NO 2.
Environmental Protection Agency, Washington, DC. Office of Solid Waste Management Programs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 155, Price codes: A02 in paper copy, A01 in microfiche. Report No EPA/530/SW-151.2, December 1975. 20 p, 9 ref.

Descriptors: *Waste disposal, *Environmental effects, *Public health, Publications, Water pollution, Water pollution effects, Soil contamination, Oil wastes, Missouri, Colorado, Texas, Chemical wastes, Groundwater, Ponds, Industrial wastes, Sand pits, Surface waters, Water wells.

Three incidents of improper land disposal of hazardous wastes are documented as part of an investigation to determine the impact of such practices on public health and on the environment. The incidents reported are: (1) the spraying of dioxin-contaminated waste oil on three horse arenas and a farm road in Missouri in May and June 1971; (2) the disposal of chemical wastes in unlined ponds between 1943 and 1957 causing contamination of groundwater beneath the Rocky Mountain Arsenal and surrounding area between Denver and Brighton, Colorado; and (3) the disposal of acidic and oily industrial wastes into an unlined, abandoned sand pit in Crosby, Texas, between the mid-1960s to 1971 causing contamination of ground-and surface waters which affected domestic wells. 5F. Water Treatment and Quality Alteration

COPPER SULFATE HELPS CONTROL MICORGANISMS IN RESERVOIRS,
S. B. Tuwiner.
Water and Sewage Works, Vol. 123, No. 12, p 68-70, December 1976. 20 ref.

Descriptors: *Water treatment, *Copper sulfate, *Reservoirs, *Algae, Pre-treatment(Water), Eutrophication, Chlorination, Water purification, Hypochlorite, Water pollution control.

There is a general increase in organic matter in potable water derived from discharges and biosynthesis in surface water supplies and from plankton in reservoirs. This organic matter is treated with chlorine and hypochlorite which produces chlorinated organics potentially dangerous to health. Copper sulfate added to reservoirs prevents algal growth ad thereby reduces the amount of organic matter that would otherwise be subject to chlorination. The combined objective of water purification should be: (1) to provide treatment plus pre-treatment, (2) to minimize the final chlorine demand, and (3) to provide free chlorine in post-treatment. Copper sulfate is used to prevent the synthesis of organic matter by algae and to reduce filter clogging; filters may then more effectively remove organics and reduce turbidity. Copper sulfate is also protective against certain carcinogens. While there is no evidence that the compound has this protective effects in water it would be unwise to eliminate copper sulfate treatment until its lack of uselfulness against carcinogens in water is proven. WATER PURIFIER,
Teledyne Industries, Inc., Fort Collins, CO. (Assignee).
T. E. Corder.
U.S. Patent No. 4,107,046, 16 p, 22 fig, 29 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1250, August 15, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Filtration, Flow control, Filters.

A filter cartridge, for an internally by-passable water purifier apparatus, is in the form of a tubular shell that has inlet and outlet walls with at least one opening being defined in each. A water filtering material is placed within the shell. Running lengthwise of the shell is an arrangement for guiding water from the inlet to the outlet regions and exclusive of the filtering material. That arrangement is either interiorly of or external to the shell. The cartridge is usable in a purifier apparatus that has a housing with an inlet for the flow of water as well as a single outlet area for discharging the flow of water. A channel defines the path of water flow from the inlet to the outlet, and a chamber is defined in that channel in the path of the flow. One valve in the channel controls the flow of water from the inlet through the cartridge to the outlet. In addition, another valve controls the flow of water from the inlet to the outlet along a path that by-passes the cartridge. (Sinha-OEIS)

HOME WATER DISTILLER,
F. C. Kirschman, and W. B. Bolte.
U.S. Patent No. 4,110,170, 7 p, 5 fig, 19 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2297, August 29, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, *Distillation, Condensation, Condensers, Temperature, Domestic water, Distiller.

A home distiller provides for an efficient distillation process. The inlet water supply is controlled as a function of the temperature of the output of the distiller and the inlet water is preheated by introducing it inot a chamber surrounding the condensor coils. After preheating, the water flows into the boiling chamber. The unit is provided with a flow-through or constant-flush drainage system to

keep mineral buildup to a minimum, and to provide for automatic control of the input water. (Sinha-OEIS)

REVERSE OSMOSIS WATER UNIT,
P. D. Maples.
U.S. Patent No. 4,110,219, 6 p, 9 fig, 11 ref; Official Gazette of the United States Patent Office, Vol. 973, no 5, p 2313, August 29, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Reverse osmosis, Domestic water, Membrane processes, Activated carbon.

A portable water container for holding water treated by reverse osmosis water purification rests on a base. The base has a recess in which the reverse osmosis unit is laid. Water is supplied to the portable water container and an overflow is provided. The reverse osmosis unit can be quickly and easily removed from the base by merely lifting the osmosis unit from the recess and pulling stopper type end connectors from the ends. The walls of the recessed portion of the base restrains movement of the stopper end connectors from the osmosis units during use. The reverse osmosis unit also has activated carbon impregnated paper through which the water passes providing further water treatment. (Sinha - OEIS)
W79-02329

WATER TREATMENT APPARATUS AND METHOD,
Societe Degremont Paris (France). (Assignee).
R. Louboutin.
U.S. Patent No. 4,111,802, 12 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 1, p 329, September 5, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water pollution treatment, Separation techniques, Mixing, Flocculation, Chemical precipitation, Crystallization.

A method and apparatus for treating water by flocculation and/or cyrstalline-precipitation type treatments is described. The invention is particularly suitable for treating water which is charged or saturated with inorganic salts that can be precipitated in the form of a crystalline sludge by means of known chemical reagents with which they form compounds of low solubility. A single enclosure includes a reaction zone and a decanting zone. Water to be treated is introduced into the bottom of the reaction zone. A pump turbulently mixes the dwater and sludge within a turbulent area and passes the resultant mixture through a central passage at a rate several times higher than the rate at which the water is introduced into the reaction zone. A first portion of the mixture is recycled back into the turbulent area. A second portion of the mixture, including a relatively high concentration of sludge, is distributed to the bottom of the decanting zone, at a flow rate and at a pressure sufficient to ensure that the mixture of sludge and water will be distributed uniformly throughout the entire area of the lower portion of the decating zone. The purified water passes upward through the decanting zone and is collected. The sludge settles downward to the bottom ofthe decating zone and is returened to the turbulent area of the reaction zone. (Sinha - OEIS)

NOVEL COMPOSITIONS OF MATTER FOR USE IN THE TREATMENT OF AQUEOUS SYSTEMS,
Ciba-Geigy Corp., Ardsley, NY. (Assignee).
P. Miles, N. Richardson, and M. A. Finan.
U.S. Patent No. 4,111,804, 7 p, 2 tab, 11 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 329-330, September 5, 1978.

Descriptors: *Patents, *Water treatment, *Scaline, *Water quality control, Desalination, Industrial water, Hardness(Water), Chemical precipitation, Calcium compounds, Magnesium, Organic compounds, Telmers.

A method is provided for inhibiting scale formation by salts of calcium, magnesium, barium and strontium from aqueous solutions over a wide range by adding to the aqueous solution a minor proportion of the product comprising a telomer. The telomeric compounds show good control of calcium carbonate, calcium sulphate and magnesium hydroxide scales and more importantly modify the crystal structure of the scale so that it is non-uniform and easily removable. Descriptors: *Water treatment, *Water pollution treatment, *Pesticide removal, *Potable water, Coagulation, Distillation, Filtration, Ion exchange, Chemical degradation, Polychlorinated biphenyls, Hazardous wastes, Trace elements, Radiation, Effluents, Influents, Associated costs, Carbon, Adsorption, Lime, Oxidation chemical precipitation, Electrodialysis, Reverse osmosis, Beryllium, Chlorinated hydrocarbon pesticides, Cobalt, Lithium, Antimony, Bis-ethers, Molybdenum, Nickel, Organophosphorus pesticides, Tungsten, Vanadium.

A literature search was initiated to summarize and evaluate all available data on removing the following hazardous substances from drinking water: antimony, beryllium, cobalt, lithium, molybdenum, nickel, tungsten, vanadium, bis-ethers, polychlorinated biphenels, chlorinated hydrocarbon insecticides, and organophosphorus insecticides. The characteristics of each contaminant are listed, and include: natural and industrial sources and uses; occurrence in drinking water supplies; toxicology; and a list of treatment and removal methods. Each treatment method is described separately in regard to process theory, process configurations and design, general and specific applications, and process economics. The processes discussed are adsorption, chemical oxidation, coagulation/precipitation, distillation, electrodialysis, ion exchange, radiochemical degradation, reverse osmosis, and ultra filtration. It is concluded that the best currently available method for treating all organic contaminants is activated carbon adsorption; inorganic contaminants can best be treated by lime coagulation. Control of aquatic plants in streams (particularly in English chalk streams) by mechanical removal or by shading through planting of trees along the bank is evaluated, and the latter is recommended as a good ecological technique. Trees planted on the north bank will reduce light to a lesser degree than south-bank trees, but will decrease flood risk without reducing the total organic input, including leaf fall. If organic input is already sufficient or excessive, trees should be planted on the south bank to reduce total organic input. The tree line should include gaps to allow for areas of plant growth, which are necessary for fish and invertebrate cover, provide a source of oxygen to the water, and help retain leaf fall evenly. Deciduous trees should be chosen to allow some overwinter growth of aquatic plants and provide a canopy more suitable for machine and dry fly fishing. Costs of tree planting are about the same as plant removal. While plant removal temporarily reduces the risk of flooding, subsequent plant growth is both vigorous and synchronized. Plant growth synchronization causes maximum biomass to coincide over the whole population, and streamflow restriction is actually intensified. In addition, managed streams tend to become trapezoidal channels with only transient patches of sediment, whereas natural streams with stable sediment patches have riffles and pools favorable to fish and invertebrates. Plant removal either earlier in the spring or in late all might achieve better control. (Lynch-Wisconsin)

EPA'S CONSTRUCTION GRANTS PROGRAM: PERSPECTIVES COSTS,
Environmental Protection Agency, Washington, DC.
D. M. Costle.
Pollution Engineering, Vol. 10, No. 9, p 40-43, September 1978.

Descriptors: *Grants, *Construction grant program, *Treatment facilities, *Waste water treatment, *Construction costs, *Financing, *Federal Water Pollution Control Amendments of 1977, *Regulation, Environmental Protection Agency, Federal government, Costs, Construction, Legislation, Institutional constraints, Sewage treatment, Waste treatment, Municipal wastes, Operation and maintenance, Tertiary treatment, Economic impact, Local governments, Cost-benefit analysis, Planning, Decision making, Use rate, Policy, Cost-effectiveness.

A description of EPA's construction grants program for waste treatment facilities, emphasizes costs and benefits of advanced waste treatment (AWT) and overall financial impact of the construction program on local communities. A realistic estimate of needs for AWT facilities is $1.5-2.0 billion, covering the cost of plants for total nitrogen removal or achievement of BOD limitations of less than 10 mg/l. A review of 6500 projects shows only 330 will require treatment to achieve these levels. In some cases AWT is mandated by state requirements, but costs of compliance may exceed benefits. The Vertex study, commissioned by EPA, indicated many AWT projects carried out with inadequate planning and justification resulted in excessive expenditures and insufficient compensating benefits. Improved monitoring is needed at the state level. Over 65% of the grants have gone to communities of 10,000 or less, many of which are experiencing financial problems. In 40% of the communities, operation and maintenance plus debt retirement for new facilities will cost over $100/household/year. An expensive treatment system is one in which such costs are 1.5-2.5% of local median income, the case in 10-20% of these communities. Several provisions of the 1977 amendments to the Water Pollution Control Act address these problems, providing more assistance, allowing more flexibility, and removing some of the paperwork. Five of the provisions are discussed. (Lynch-Wisconsin)

OVERSEAS MARKETS FOR THE WATER INDUSTRY - NIGERIA,
M. A. Kershaw.
Effluent and Water Treatment Journal, Vol 18, No 8, p 397-401, August 1978. 8 ref.

Descriptors: *Nigeria, *Marketing, *Water pollution control, *Waste water treatment, *Treatment facilities, *Export, *International trade, *Great Britain, Consulting firms, Engineering, Economics, Economic feasibility, Water supply, Water reuse, Water delivery, Water conservation, Developing countries.

Opportunities for British consulting engineering firms to obtain overseas contracts for water supply, treatment, distribution, conservation, and reuse, wastewater treatment, and water pollution prevention are discussed, with particular reference to Nigeria. Nigeria, under military rule since 1967, is expected to revert to civil government in 1980. Oil production provides almost 95% of foreign exchange, and is expected to last for some 30 years. The cost of the Third Development Program, to be completed in 1980, is estimated at 40 billion U.K. pounds. The project includes water treatment and distribution, sewerage, and wastewater treatment. In most urban centers, the only modern wastewater treatment facilities are located at hospitals, military installations, new universities, and individual factories; many such plants are nonfunctional or functioning poorly, mainly due to lack of trained operators. Major opportunities for foreign firms will be in construction and capital plant. Governments of developing countries typically invite consulting engineers, either directly or through an international agency, to submit a feasibility study, and later a detailed proposal, for acceptance. Useful background information on the prospective country can be obtained from the Ministry of Overseas Development. A senior member of a successful firm may make frequent visits to the country to secure contacts. (Lynch-Wisconsin)

COEFFICIENTS OF POLLUTION: INTERINDUSTRY LINKAGE AND POLLUTION IN BELGIUM,
State Univ. of New York at Binghamton. School of Management.
M. Chatterji.
Environmental Management, Vol. 2, No. 4, p 300-312, July 1978. 11 tab, 8 ref.

Descriptors: *Belgium, *Netherlands, *United States, *Pollution coefficients, *Pollution abatement, *Methodology, Pollutant identification, Analytical techniques, Economics, Environmental economics, Industrial wastes, Input-output analysis, Air pollution, Water pollution, Pollutants, Classification.

A technique is presented for using pollution coefficients derived from data collected in one country for economic analysis of a similar country for which data are unavailable. In this paper data for the Netherlands (Den Hartog and Houweling, 1974) and the United States (Leontief and Ford, 1972) yield pollution coefficients subsequently combined with input-output data prepared for Belgium by the National Institute of Statistics in 1970. Results provide crude estimates of the amount of direct and indirect air and water pollution generated from production of a unit of activity in different sectors of the Belgian economy. With this method considerable data collection expense is avoided, though results clearly are only indications since industrial mix and state-of-technology vary between countries. The input-output data consists of 93 industrial classifications, reduced to 53 in this study. Pollution coefficients obtained for the United States and the Netherlands cannot be directly compared because different pollutant classifications are used. Five pollutant types are identified in the U.S. study: particulates, sulfur oxides, hydrocarbons, carbon monoxide, and nitrogen oxides. The classification for the Netherlands data are: public water pollution, private water pollution, sulfur pollution from gas oil, sulfur pollution from residual oil, solid waste, pollution from automobiles, and pollution from trucks and vans. All coefficients are given in tables. (Lynch-Wisconsin)

THE CHOICE OF EFFICIENT POLLUTION POLICIES: TECHNOLOGY AND ECONOMICS IN THE CONTROL OF SULPHUR DIOXIDE,
London School of Economics and Political Science (England).
A. Marin.
Journal of Environmental Economics and Management, Vol 5, No 1, p 44-62, 1978. 1 tab, 40 ref.

Descriptors: *Regulation, *Sulfur dioxide, *Air pollution, *Pollution abatement, *Technology, Economics, *Pollution taxes(Charges), *Standards, Water pollution control, Damages, Optimization, Emission standards, Monitoring, Heavy metals, Pollutants, Rivers, Input-output analysis, Sulfur, Information.

Reexamination charges vs. regulations for pollution control, with sulfur dioxide as a case study, shows that charges are not always preferable to regulations, and the choice depends on the specific pollutant. Charges would seem more suitable for river pollution than for control of sulfur dioxide--with the exception of initial sewage generation--in terms of several issues: (1) damage functions and optimality, (2) spatial uniformity, (3) number of polluters, (4) monitoring of emissions, (5) relationship between inputs and emissions, and (6) iterations and exactness. Major provisos are problems of monitoring emissions of oxygen-depleting waste, and the necessity of keeping heavy metal contamination of food to acceptable levels. For sulfur dioxide, charges are only practical when levied on the fuel, because of the expense of monitoring emissions and because sulfur inputs equal sulfur dioxide output. Though a tax on fuel sulfur content (with certain exceptions) might be best for reducing all emissions, the inefficiency of attempting this would probably instead lead to a preference for quantitative limits in an effort to achieve acceptable ambient concentrations and to single out worst offenders. This paper presents a technological summary of sulfur dioxide as a pollutant, discusses informational requirements of alternative policies, and compares continuous monitoring with spot checks. (Lynch-Wisconsin)
W79-02038

COORDINATING PUBLIC UTILITY EXPANSION, INDUSTRIAL SITING AND POLLUTION CONTROL: A WORKING DYNAMIC PROGRAMMING ALGORITHM,
California Univ., Riverside. Dept. of Economics.
M. Sheehan, and K. C. Kogiku.
Socio-Economic Planning Sciences, Vol 11, No 6, p 331-338, 1977. 1 fig, 4 tab, 13 ref.

Descriptors: *Algorithms, *Dynamic models, *Public utilities, *Industries, *Pollution abatement, *Wastewater treatment, *Sites, *Planning, Mathematical models, Model studies, Land use, Economic development, Alternative planning, Decision making, Water pollution control, Air pollution, Welfare(Economics), Economics, Computer programs, Sewage treatment, Electric power demand, Trade-offs, Iteration.

A tactical planning method facilitates formulation of a joint plan for public utility capacity management, air and water pollution control, and choice and staging of industrial development in an area. Two mathematically uncomplicated models are linked through an iterative process which obviates computational difficulties usually associated with large-scale dynamic programming formulations. A point system is used in conjunction with data on the estimated impact of the industrial project on municipal and special district revenues, employment, demand for housing, and the like, to yield a measure of gross benefits for each applicant firm. Gross benefits are then combined with utility costs to determine net benefits. Firms violating pollution regulations or having negative net benefits are eliminated, at least temporarily, and a distribution-of-effort algorithm is used to choose among remaining firms. A finite-horizon regenerating model determines the optimal long-run capacity construction plan. An iterative procedure sets the final mix of all components. Use of the method as a fully operational direct planning tool would require centralizing all long-range planning responsibilities into one agency invested with permit power over industrial ingress. Types of required data include: (1) a description of each applicant firm, (2) utility expansion costs, and (3) pollution costs. (Lynch-Wisconsin)

THE LIMITED APPLICABILITY OF MARSHALLIAN ECONOMICS TO THE PROBLEM OF POLLUTION ABATEMENT: A SUGGESTED ALTERNATIVE,
Indiana Univ. at South Bend. Dept. of Economics.
P. Kochanowski, J. G. Witte, and B. Henneberry.
Journal of Economics and Business, Vol 30, No 3, p 219-223, 1978. 1 tab, 12 ref.

Descriptors: *Economics, *Mathematical models, Analytical techniques, Partial equilibrium models, General equilibrium models, *Pollution taxes(Charges), *Regulation, *Pollution abatement, Optimization, Equilibrium, *Model studies, Welfare(Economics), Methodology, Estimation.

Mathematical analysis shows that the partial equilibrium method may result in systematic underestimation of socially optimal effluent charges by as much as 50%. The Marshallian ceteris paribus limits the applicability of partial equilibrium results, especially in the implied neglect of systematic feedbacks on relative output prices and quantities of changes in relative factor prices induced by the charges themselves. This negligibility is demonstrated by applying sensitivity analysis to optimal pollution tax rates determined in the context of a two-sector general equilibrium model. The analysis comprises four steps: (1) marginal conditions derived from a Bergson-type welfare function lead to a general statement of optimal tax rates; (2) optimal tax rates determined with and without impact of the tax on input markets lead to the difference between partial and general equilibrium tax rates as a function of rates of change in prices of capital and labor with respect to the tax; (3) solution for rates of change in prices of capital and labor from a two-sector, two-factor general equilibrium model leads to the difference between partial and general equilibrium tax rates as a function of the characteristics of polluting and nonpolluting sectors, and (4) estimates of these characteristics for the general equilibrium system lead to estimates of the direction and magnitude of the difference between partial and general equilibrium tax rates. Four situations are identified in which Marshallian

and general equilibrium tax rates are identical. (Lynch-Wisconsin)
W79-02041

THE BUSINESS OF POLLUTION CONTROL - A BED OF ROSES OR THORNS.
Pollution Engineering, Vol 10, No 7, p 32-44, 1978. 1 fig, 2 tab.

Descriptors: *Pollution abatement, Equipment, *Technology, *Research and development, *Air pollution, *Water pollution control, Federal Water Pollution Control Act Amendments of 1972, Environmental Protection Agency, Demand, Federal government, Attitudes, Surveys.

Results of a questionnaire sent to 4000 manufacturers of pollution control equipment and components requesting opinions on a variety of topics relating to the industry are presented, and representatives of 20 equipment manufacturers provide personal views on problems of the pollution control market. Several agencies were rated according to their degree of support for pollution control products: EPA was rated by 68% of respondents as helpful and by 32% as not helpful or a hindrance, Commerce Department 51% and 49%, Energy Department 41% and 59%, Interior Department 36% and 64%, President's Council on Environmental Quality 28% and 72%, and H.E.W. 26% and 74%. Respondents considered an average of 45% of their own products as innovative, and companies spend an average of 10.1% of total sales on new equipment research. About 46% of manufacturers believe there will be long term growth in the market, 27% that the market will grow in the short run and then level off, 8% that the market will decline after 1985, and 16% that there will be a change from providing products to providing services. Regarding the best approach to environmental protection, 40% feel a coordinated international approach would be better than the present system; other suggestions include more use of cost-benefit analysis and for EPA to employ personnel who are more technically qualified and less political. About 41-44% feel EPA has stifled new product development or discouraged engineers from trying and specifying new products. (Lynch-Wisconsin)

International Institute for Applied System Analysis, Luxemburg, Research Report 77-10, May 1977. 45 p, 9 fig, 7 ref, 1 append.

Descriptors: *Pollution taxes(Charges), *Economics, *Pollution abatement, *Water pollution control, *Stability, *Economic efficiency, *Regional economics, *River basins, Water management(Applied), Externalities, Model studies, Mathematical models, Game theory, Water quality standards, Optimization, Cost-benefit analysis, Damages, Waste water treatment, Waste water disposal, Effluents, Institutional constraints, Political constraints, Economies of scale, Damage functions, Public benefits.

Simple game theory is used to analyze the stability and efficiency of regional pollution tax schemes, focusing on water pollution control in a river basin. Stability (where users have no incentive to reject the plan) and efficiency can be attained by permitting the regional authority to sell emission rights for profit, with higher profit necessary with increasing environmental congestion. In the absence of profit, social benefits cannot be maximized without generating friction among the polluters. Efficiency and stability are easily attainable if environmental damage is ignored, that is, if total benefit of firms rather than social benefit is maximized. Such a situation, which has characterized the course of industrialization throughout the world during the past century, is no longer tolerable. Three classes of abatement schemes are evaluated: (1) Effluent standards are imposed by law on each firm, and wastewater treatment is handled by a regional authority with cost recovery through apportionment of costs among users based on residuals of each firm. (2) Pollutant removal standards are legally imposed, with taxes on waste production. (3) Effluent charges are levied; stable taxation schemes only exist where firms realize high profits. The analytical model considers two basic institutional arrangements, treatment plants owned and operated by producers, or plants operated by a regional authority. (Lynch-Wisconsin)

PRICING AND STANDARDS IN THE CONTROL OF POLLUTION,
York Univ. (England).
M. Ricketts, and M. G. Webb.
Scandinavian Journal of Economics, Vol 80, No. 1, p 53-61, 1978. 2 fig, 6 ref.

Descriptors: *Pricing, *Standards, *Pollution taxes(Charges), *Regulation, *Timing, Policy, Air pollution, Water pollution control, Governments, Costs, Marginal costs, Model studies, Mathematical models, Political constraints, Optimization.

Where a government wishes to control the timing as well as the standards of pollution abatement, and where costs are influenced by both abatement level and timing, no single tax may produce a politically acceptable outcome. To achieve the latter (at least cost) may require a complex tax structure. In certain circumstances, however, the combination of a central directive requiring abatement by a given date and a single Baumol-Oates type of post-abatement would lead to efficient results with a simpler structure. The analysis is based on the observation that: (1) the choice of a particular tax rate on emissions determines not only the abatement level but also the time of abatement, and (2) setting the optimal tax at a level equal to an industry's long-run marginal costs of abatement raises the question of which long-run marginal cost function is relevant. The model used assumes that society has determined the acceptable abatement standards and time limits. Other conclusions are that: (1) where different firms have unequal abatement cost functions the tax solution requires that a different tax rate be applied to every firm; and (2) the relevant concept of the long-run relates to the acceptable level of delay, and the optimal tax should be imposed after this time has elapsed. A POLLUTED GOLDEN AGE,
Chicago Univ., IL.
W. A. Brock.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, N.Y., p 441-461, 1977. 21 ref.

Descriptors: *Economics, *Economic growth, *Pollution abatement, *Mathematical models, *Club of Rome, Costs, Equilibrium, Model studies, Cost-benefit analysis, Capital, Externalities, Interest rates, Optimization, Utility, Pollution taxes(Charges), Marginal costs, Discount rates.

An economic growth model is presented which includes pollution costs, and its use in analyzing current environmental issues is demonstrated regarding the Club of Rome report. The report basically contends that continuation of population growth, pollution productions, and energy consumption at current or even lower rates will essentially cause society to collapse. Critics argue that the report ignores the role of the price system in holding down energy usage. This paper discusses: (1) the model; (2) how growth theory relates to equilibrium theory, with emphasis on externality taxes; (3) biases in the observed market rate of interest when pollution is accounted for (important in discounting future benefits in cost-benefit analysis); and (4) use of such models in building a theoretical apparatus for discussion of issues raised in the Club of Rome report, focusing on whether free enterprise has a self-corrective mechanism to avoid a development vs. pollution catastrophe. It is shown that if a pollution tax is set equal to the marginal social cost of polluting, then competitive equilibrium internalizes the externality which produces the optimal amount of goods and pollution. (Lynch-Wisconsin)

OPTIMAL CONFIGURATION OF THE COOLING SYSTEM FOR POWER GENERATION,
Kansas Water Resources Research Inst., Manhattan; and Kansas State Univ., Manhattan. Inst. for Systems Design and Optimization.
L. T. Fan, S. H. Lin, R. Shojalashkari, and C. L. Hwang.
Contribution No. 149. In: Energy Sources, Vol. 1, No. 4, p 401-422. 1974. 10 fig, 17 ref. OWRT B-037-KAN(4), 14-31-0001-4086.

Descriptors: *Cooling towers, Water pollution control, Investment, System synthesis, *Optimal cooling systems, *Power generation, *Cooling ponds, Direct discharge subsystem, Structural parameter method, Generalized reduced gradient method.

The purpose was to apply a system-synthesis technique to the determination of the optimal cooling system for power generation. The cooling system was assumed to consist of a cooling tower, a cooling pond, and a direct-discharge subsystem. The optimal cooling system was determined in light of minimizng the total capital investment requirement of the whole system and satisfying the temperature-rise constraint imposed on the cooling-system output. The structural-parameter method, in conjunction with the generalized reduced-gradient (GRG) method, was employed to optimally synthesize the cooling system. Under the assumptions made, the cooling tower and the cooling pond should not be connected in series.

WATER QUALITY CAN AFFECT MANAGEMENT PLANNING,
R. Ross.
Irrigation Age, Vol. 12, No. 1, p 60, 63, September, 1977. 1 fig.

Descriptors: Sodium, *Salt, *Saline water, Soils, *Irrigation, Irrigation effects, Irrigation practices, *Water quality, Water management(Applied).

Over a period of time, particularly on a fine-textured soil, a high concentration of sodium could change the character of the soil so that water could no longer penetrate it. A large amount of total salts could cause an 'artificial drought.' High sodium and/or too much total salts are among the primary reasons that irrigation water which may appear to be fine may, in face, be of poor quality. (Skogerboe-Colorado State)

THE OCCURRENCE AND REMOVAL OF NITROGEN IN SUBSURFACE AGRICULTURAL DRAINAGE FROM THE SAN JOAQUIN VALLEY, CALIFORNIA,
California Dept. of Water Resources, Sacramento.

R. L. Brown.
Water Research Vol. 9, No. 5/6, p 529-546, May/June 1975. 11 fig, 7 tab, 39 ref.

Descriptors: *Drainage, *Drainage effects, *Water treatment, *California, *Nitrogen, Waste water treatment, Water pollution, Return flow, *San Joaquin Valley(Calif).

During the years 1967-1973 there have been extensive studies of subsurface agricultural drainage in the San Joaquin Valley of California. These studies, by cooperating state and federal agencies, were to determine the composition and quantity of drainage waters produced from irrigated agriculture, to evaluate possible methods of removing problem constituents (mainly nitrogen) from these waters, and to obtain an idea of the effectiveness of the treatment methods studied for reducing the waters' biostimulatory content with respect to potential receiving waters. RESEARCH ON CONTROL TECHNOLOGY FOR ICE FOG FROM MOBILE SOURCES,
Environmental Protection Agency, College, AK. Alaska Water Lab.
H. J. Coutts, and R. K. Turner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 611, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-055, May 1978. 98 p, 27 fig, 3 tab, 14 ref, 4 append.

Descriptors: *Ice fog, *Automotive emissions, *Heat exchangers, *Air pollution effects, *Pollution control devices, *Cold regions, Mist, Pollution abatement, Pollutant identification, Condensation, Water vapor, Condensers.

Ice fog is a form of air pollution caused by the release of water vapor into air too cold to hold the water in vapor form. The vapor condenses into ice particles, which severely restrict visibility during extremely difficult driving conditions in subarctic areas, such as Alaska. The three major sources of ice fog are automotive and truck exhausts; open water surfaces, such as cooling ponds; and exhaust gases from heating and electrical powerplants. Research was conducted during the 1974-75 and 1975-76 winters, to determine and evaluate methods of reducing automotive generated ice fog. The major technique evaluated was removing the water vapor as a liquid condensate using cooler-condensers. These devices are heat exchangers in which the exhaust gas is cooled by cold ambient air or coolant from the automobile radiator. It was found that when using the cooler-condensers only, much of the condensed water formed a mist; therefore, use of coalescers was necessary to transform the mist into water. As on-the-road performance of a cooler-condenser equipped vehicle revealed that 81% of the overall water vapor was condensed at an ambient temperature of -16F. Estimations are that 50% of the ground level ice fog is generated by automotive sources, and that if ice fog control devices yielding an 80% reduction were used, vehicle ice fog emissions would be reduced approximately 40%. INNOVATIVE WATER SYSTEM SOLVES QUALITY PROBLEM,
Tacoma Dept. of Public Utilities, WA. Water Div.
J. A. Roller, and W. N. Moline.
Water and Sewage Works, Vol. 125, No. 11, p 70-73, November, 1978. 2 fig.

Descriptors: *Conjunctive use, *Water supply, *Turbidity, Water quality telemetry, Remote control.

Tacoma's principal water source, the Green River, has excessive turbidity in the late winter and early spring. At such times it is necessary to augment this supply with ground water from the North Fork well field, one of the most productive in the world. The six production wells have a total yield of 72 MGD with comparatively little drawdown. Six Byron Jackson submersible pumps, each with a capacity of 8,333 Gpm, were installed. From the North Fork wells, water is piped 7 miles to a 10 MG storage tank. When turbidity occurs in the Green River the river water is blended with well water from the storage tank to reduce turbidity to acceptable limits. The water-blending operation is controlled by two upstream turbidometers that continuously sample the river. Communications between the automated components of the pumping and blending systems are controlled by a solar-powered microwave relay station. When water from the storage tank is injected into the system on signal from the turbidity sensors, it will hydraulically block some or all of the river water, depending on how many blending valves are opened. (Purdin-NWWA)

UNDERGROUND INJECTION CONTROL PROGRAM STUDIED,
D. Webster.
Drill Bit, Vol. 27, No. 11, p 27, November, 1978

Descriptors: *Injection, *Oil industry, *Water pollution, State governments, Administrative agencies, Environmental protection agency, Water flooding, Waste disposal wells

At the annual meeting of the New Mexico Oil and Gas Association, Joe Raney, director of the state's Oil Conservation Division reported that ground water contamination from injection programs appears to be diminishing in Lea County but increasing in nearby Eddy County. However, there is not as much fresh water in the affected areas of Eddy County so the contamination potential is not as great. The state of New Mexico, in collaboration with the Federal Environmental Protection Agency, will soon be making an inventory of an estimated 16,000 oil field pits in the state. The EPA will also attempt to inventory all injection wells in the state. A recommendation will be made to the state legislature that the New Mexico Oil Conservation Commission be abolished and that the director of the state's Oil Conservation Division take over the responsibility of presiding over hearings. PLANNING FOR OFFSHORE OIL DEVELOPMENT, GULF OF ALASKA OCS HANDBOOK,
Alaska Dept. of Community and Regional Affairs, Juneau. Div. of Community Planning.
L. S. Kramer, V. C. Clark, and G. J. Cannelos.
1978. 271 p.

Descriptors: *Alaska, *Resource development, Planning, *Oil industry, Exploration, Water quality control, Pollution abatement, Baseline studies, Environmental effects, Leases, Industrial production, *Outer Continental Shelf, Gulf of Alaska, Petroleum development.

The basic State policy framework within which the orderly search for offshore oil resources in the Gulf of Alaska and off Kodiak Island can proceed, is presented. This handbook provides information about the basic operations and planning requirements of the offshore industries. The purpose of the book is to clarify the nature of outer continental shelf (OCS) oil and gas activity in the waters off Alaska and to spell out what it will mean to all Alaskans, particularly to people in coastal communities directly involved. The book sets forth the State's policies on OCS development, encouraging cooperation and coordination of effort among local governments and state agencies so that related onshore activities will confer the most benefit and the least harm. OXYGEN TRANSFER AT HYDRAULIC STRUCTURES.
Watson (J. D. and D. M.). London (England).
S. T. Avery, and P. Novak
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY11, Proceedings Paper 14190, p 1521-1540, November 1978. 8 fig, 4 tab, 35 ref, 2 append

Descriptors: *Air entrainment, *Dissolved oxygen, *Oxidation, Laboratory tests, Model studies, Mathematical models, Hydraulic structures, Weirs, Jets, Spillways, Rivers, Water quality, Oxygen, Water pollution, Sewage, Turbulence, Hydraulic jump, Hydraulics, Hydraulic engineering.

The shortcomings of existing equations for the prediction of oxygen transfer at hydraulic structures were illustrated, particularly with reference to free overall weirs. The effect of all important hydraulic variables was reviewed together with water quality effects, in particular the effect of dissolved salts. Modelling according to the Froude law of similarity, the oxygen transfer expressed as a deficit ratio, was shown to vary as a simplified function of the scale. Equations were submitted describing the oxygen transfer in an hydraulic jump and at a free overfall weir. The lattr equation was shown to correlate successfully both model studies and measurements at a number of prototype structures; and, further, the application of the equation to a variety of situations such as spillway jets, multiple jet weirs and cascade of pools was described. An equation to estimate the optimum pool conditions for oxygen transfer was presented. (Sims-ISWS)

A SYSTEMATIC PROCEDURE FOR TAXING AGRICULTURAL POLLUTION SOURCES,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
W. R. Walker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 656, Price codes: A06 in paper copy, A01 in microfiche. Report No. AER 75-76 WRW-1, October 1975. 107 p, 22 fig, 12 tab, 33 ref. NSF GK 42122.

Descriptors: *Water pollution sources, *Agriculture, *Agricultural runoff, *Pollution taxes(Charges), *Colorado River, Water pollution, Salts, Salinity, Leaching, Irrigation, Evapotranspiration, Water quality, Model studies, Mathematical models, Economics, Hydrology, Geology, Taxes, *Nonpoint water pollution sources, Irrigation return flow.

A methodology for taxing diffuse agricultural pollution sources was presented. The methodology is based upon deriving linkages between 3 economic and hydrologic modeling systems. The procedure involves modeling the hydro-quality system in the agricultural area in order to identify the specific processes causing water quality degradation. Then, these results are linked through a pollution coefficient to an economic externalities model describing the detriments incurred by downstream uses of water with poor quality characteristcs. An input-output model was developed from which input coefficients and business multipliers were calculated as a means of assessing the local economic impact of alternative taxing policies. The Grand Valley in Western Colorado was taken as the case study for this project since it is one of the more significant sources of salinity in the Colorado River Basin. The analysis evaluated the potential for taxing agricultural croplands in the valley as a means of controlling salinity-related damages in the lower Colorado River Basin. Four groups of taxing strategies were investigated: (1) directly attributable detriments, (2) per acre equivalent salt loading, (3) salinity or pollution coefficients, and (4) values of gross revenue per acre. A discussion of how each tax could be applied was presented. (Sims-ISWS)

WIND INDUCED DISPERSION AND ALGAL GROWTH IN SHALLOW LAKES,
Technische Hogeschool Twente, Enschede (Netherlands). Dept. of Chemical Engineering.
F. A. DiGiano, L. Lijklema, and G. Van Straten.
Ecological Modelling, Vol. 4, No. 2-3, p 237-252, 1978. 7 fig, 2 tab, 7 ref.

Descriptors: *Winds, *Dispersion, *Algae, *Lake Brielle(Neth), *Sedimentation, *Mathematical models, Model studies, Tracers, Lakes, Shallow water, Plant growth, Euphotic zone, Darkness, Netherlands, Eutrophication, Light, Limiting factors, Phosphates, Cycling nutrients.

A simple two-compartment model consisting of euphotic and dark zones, to show effects of dispersion and sedimentation on algal growth and phosphate cycling in shallow lakes, is demonstrated for Lake Brielle, Netherlands. Results are compared to those of a multi-layer finite-difference model which more accurately represents algal concentration gradients. Simulation suggests that algal growth occurs more rapidly in calm weather when wind-induced dispersion is negligible. Dispersion may influence the rate of particulate phosphate accumulation in sediment due to settling out of algal cells, and may also influence the soluble phosphate profile in the overlying water column. A tracer technique was used in Lake Brielle to measure dispersion caused by a moderate wind of 4 m/sec; results ranging 4-6 sq cm/sec compared well with predictions. The two models agreed well in predictions of average algal concentrations in euphotic and dark zones with dispersion rates of 0-6 sq cm/sec and sedimentation rate constants of 0.002-0.02 m/hr. Simulated wind-induced dispersion of only 1 sq cm/sec greatly suppressed algal growth in the euphotic zone; a higher sedimentation constant likewise restricted algal growth, even more pronounced with the inclusion of dispersion. It is uncertain whether dispersion values of 0 sq cm/sec actually occur during calm weather. (Lynch-Wisconsin)

BEST MANAGEMENT PRACTICES TO CONTROL NONPOINT-SOURCE POLLUTION FROM AGRICULTURE,
Environmental Protection Agency, Washington, DC. Office of Water and Hazardous Materials.
J. A. Krivak.
Journal of Soil and Water Conservation, Vol. 33, No. 4, p 161-166, 1978. 3 tab, 8 ref.

Descriptors: *Nonpoint pollution, Agriculture, *Water pollution control, *Best management practices, *Crop production, *Livestock, Federal Water Pollution Control Act Amendments of 1972, Clean Water Act of 1977, Irrigation, Feedlots, Pasture management, Pollutant identification, Pollutants, Salts, Nutrients, Soil erosion, Soil conservation, Pesticides, Organic matter, Pathogenic bacteria, Thermal pollution, Grazing, Agricultural runoff, Cultivation.

Provisions of the Federal Water Pollution Control Act Amendments of 1972 and the Clean Water Act of 1972 requiring and facilitating implementation of best management practices (BMPs) for control of nonpoint water pollution sources are briefly described, and their relationship to agriculture is discussed. The 1977 legislation provides management and resource assistance needed to accelerate rural water quality management programs. Pollutants resulting from nonirrigated crop production include sediment, nutrients, pesticides, and organic matter. Application of irrigating cropland increases the likelihood of runoff and resultant pollution from salts, sediment, and sediment-related pollutants. Confined animal production facilities generate pollution from nutrients, organics, sediment, salts, pesticides, and pathogens. Animals on pasture or range can generate excessive sediment, nutrients, organic matter, and pathogens through elimination of protective vegetation caused by overgrazing. BMPs represent a pollution preventive; this report describes several of them. BMPs for erosion and sediment control on croplan include tillage measures, management of surface and vegetative covers, and soil and water conservation. Techniques for preventing loss of nutrients and pesticides generally involve proper application, optimum dosage, timing, and disposal of unused chemicals and containers. Prevention of overgrazing involves evaluation of the land's forage capacity, animal grazing habits, soil characteristics and slope. (Lynch-Wisconsin)

MINNESOTA'S PEAT RESOURCES: THEIR CHARACTERISTICS AND USE IN SEWAGE TREATMENT, AGRICULTURE, AND ENERGY,
Minnesota Univ., St. Paul. Dept. of Soil Science.
R. S. Farnham, and D. H. Boelter.
In: A National Symposium on Freshwater Wetlands and Sewage Effluent Disposal, May 10-11, 1976, Ann Arbor, Michigan, University of Michigan, p 241-255, 12 ref.

Descriptors: *Peat, Hydrology, *Biological treatment, Crops, Waste water treatment, Nutrient removal, Fuels Soil amendments, Wetlands, Minnesota, *Peatlands, *Sewage treatment.

The most unique type of freshwater wetland in Minnesota is the 3 million ha of peatland. The hydrologic role of peatlands may not be as significant as once thought. Rather than soaking up snowmelt and early spring rains and gradually releasing runoff through the summer, peatlands often play a less significant role in the seasonal distribution of runoff with a large portion of the annual flow occurring prior to June 15. Drained and fertilized, these organic soils are productive for both field and forest crops, especially vegetable, seed, and forage crops, wild rice,, and other specialty crops. Peat is useful as a soil amendment or as a horticultural medium for plant growth. The relatively high caloric values of peat have led to its use as fuel in Europe and similar potentials exist in Minnesota. Renovation of waste waters is quite good using a combination of the filtering and absorbing action of peat and the harvest of plants growing on the filter beds for assimulation and remova of nutrients. (Stihler-Mass)

PROGRESS REPOT ON MOSQUITOE RESEARCH: CYPRESS DOMES,
Florida Univ., Gainesville. Dept. of Entomology and Nematology; and Florida Univ., Gainesville. Center for Wetlands.
H. Davis.
In: Third Annual Report on Cypress Wetlands, Florida University, Center for Wetlands, Gainesville, p 684-706, 1976. 12 fig, 2 tab.

Descriptors: *Swamps, *Water pollution control, *Mosquitoes, *Diptera, Wetlands, Florida, Waste water disposal, Aquatic insects, Diseases, Animal diseases, Water levels.

With the exception of a few species, most of the mosquitoes associated with the cypress swamps in northcentral Florida are not avid human blood feeders; however, two exceptions, Aedes infirmatus and Aedes atlanticus, are extremely annoying human pests. Both species are abundant in cypress swamps in which levels of standing water fluctuate seasonally. By adding sewage effluent, water levels in two swamps have been maintained at fairly constant levels throughout the summer. This has greatly reduced the numbers of these floodwater species that are breeding at the margins of these domes. Although the stable water level and extensive duckweed cover have caused a reduction in the available mosquito breeding area within the domes receiving effluent, six species are still abundant. Sentinel bird studies have shown that encephalitis is present in all of the five cypress domes sampled (two sewage and three control domes) Peak encephalitis activity occurred in late June and early July, coinciding with peak mosquito activity. No virus activity has been observed in areas outside the domes. In the early spring, the most annoying insect pest in these swamps is not a mosquito but the tabanid, Diachlorus ferrugatus, the yellow fly. (See also W79-02256) (Steiner-Mass)

PRELIMINARY EVALUATION OF FINAL CUT LAKES,
Illinois State Water Survey, Urbana.
J. P. Gibb, and R. L. Evans.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 954, Price codes: A05 in paper copy, A01 in microfiche. Circular 130, 1978. 88 p, 41 fig, 39 tab, 15 ref, 1 append.

Descriptors: *Lakes, *Strip mines, *Strip mine lakes, *Water quality, Water resources, *Illinois, Pollutants, Water pollution, Chemicals, Sediments, Dissolved solids, Heavy metals, Hardness(Water), Dissolved oxygen, Hydrogen ion concentration, Water supply, Irrigation, Irrigation water, Surface waters, Stock water, Water sources, On-site investigations, Final cut lakes.

Twelve representative final cut impoundments were selected and studied to determine their volumes and estimated yield potentials. The volumes range from 97 to 3488 acre-feet and average 812 acre-feet. Estimated yield potentials at a 2-year recurrence interval range from 0.15 to 3.98 million gallons per day and average 0.86 million gallons per day. Projections of these estimates to lakes inventoried through June 30, 1971, were made and presented as county totals. The potential water supply from final cut impoundments for the 40 surface mining counties in Illinois ranges from 0 to 75.66 mgd. For 10 counties the estimated yield potential from final cut impoundments exceeds the estimated 2020 water demands. Based on published water quality requirements and data collected during this study, only 2 of the 12 lakes studied have water quality suitable as a source for public water supply. Three are suitable for irrigation, and all 12 are suitable for livestock watering. However, the quality of water from these impoundments is treatable and often comparable to the quality of alternative water sources. Each lake should be evaluated more closely in terms of yield, quality, and the economics of development as compared with other available water resources. (Sims-ISWS)
W79-02292

OIL SORBING MAT,
A. P. Lorentzen.
U.S. Patent No. 4,107,051, 4 fig, 3 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1252, August 15, 1978.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water pollution treatment, Absorption, Water quality control, Oil sorbing mat, Fibrillated film.

An oil sorbing mat comprises sections of expanded fibrillated film assembled into a flexible resilient handleable and integral structure in which the sections are juxtaposed, with openings in the juxtaposed sections overlapped to establish a network of interstices into which oil can be received and stored. Fibrillated film means film that has been formed with a myriad number of generally parallel cuts closely spaced on an axis transverse to the direction of the cuts and staggered along longitudinal axis so as to leave an integral structure that may be expended, i.e. stretched transverse to the direction of the cuts, to form a lightweight net-like structure. Conventionally, after a film has been fibrillated it is twisted into a twine or rope. In this invention it is used in an expanded form in which the transverse width of the film is at least twice the transverse width of the film prior to fibrillation.
W79-02309

OIL SALVAGER,
S. Macaluso.
U.S. Patent No. 4,108,773, 9 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 4, p 1820-1821, August 22, 1978.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water quality control, *Water pollution treatment, Separation techniques, Skimming, Gravity separation, Oil recovery, Catamarans.

An oil salvage intensity separation chamber is mounted between the pontoons of a catamaran type vessel. A positionable scoop directs a contaminent, such as oil, floating on a body of water into an inlet opening provided in the lower portion of the chamber; while a deflector directs the oil up into the column of sea-water. A sea-water opening is provided in the lower portion of the chamber, with a set of valves and a pump to facilitate accumulating the column of sea-water in the chamber. An oil outlet and pump are provided in the upper portion of the chamber to draw off the separated oil which may be pumped through a suitable conduit to a collecting facility such as a barge. As the catamaran type vessel moves, the oil contaminated sea-water moves into the chamber and because of its lighter density the oil in globs or globlets floats up through the column of sea-water into a layer floating on top of the sea-water column. (Sinha-OEIS)
W79-02315

FRESH WATER SUPPLY AND WASTE WATER RETENTION SYSTEM,
CAF Industries, Phoenix, AZ. (Asignee).
R. E. Reed.
U.S. Patent No. 4,109,604, 7 p, 7 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 973, No. 5, p 2106, August 29, 1978.

Descriptors: *Patents, *Water storage, *Waste storage, Water pollution control, Pollution abatement, Recreation, Water quality control, Recreational vehicles.

A fresh water supply and waste water retention systems is incorporated within a floating carrier for transporting land based recreational vehicles on a body of water. The system includes one or more fresh water containers and one or more waste water containers, all of which are symmetrically placed about a selected lateral axis of the carrier. The system permits the transfer of water from the fresh water containers into the waste water containers without affecting the center of gravity of either the fresh water supply and waste water retention system or the center of gravity of the floating carrier/-recreational vehicle combination. (Sinha-OEIS)
W79-02317

COMPOSITIONS AND PROCESSES FOR THE DISPERSING OF OIL SPILLAGES,
Lanko Chemicals Group Ltd., MAnchester (England). (Assignee).
D. J. Tennant, P. Sheridan, and A. J. Steel.
U.S. Patent No. 4,110,213, 7 p, 6 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 5, p 2310, August 29, 1978.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution treatment, Water quality control, *Dispersion, Toxicity, Emulsions, Chemical reactions.

This invention provides compositions and processes for the dispersing of spilled oil, wherein the compositions are substantially non-toxic, to marine life or, at least less toxic than the prior art compositions, may generally be diluted with sea water without gelation (or increase in viscosity), are efficient in dispersing the spilled oil, are of a relatively concentrated nature, and are substantially free from fire hazard. The concentrate for use in the dispersion of oil spillages is substantially free from hydrocarbon solvent and comprises from 20 to 75% by weight of an emulsifying agent, which is a mono-ester of an aliphatic carboxylic acid and a polyoxy-alkylene glycol. The concentrate is physically and chemically stable to a wide range of temperatures, and may easily be diluted with water, especially sea-water, immediately prior to application. (Sinha-OEIS)
W79-02325

APPARATUS FOR COLLECTING DEBRIS FLOATING IN A STREAM,
A. L. Wagnon, and A. J. Janoulis.
U.S. Patent No. 4,110,216, 5 p, 5 fig, 20 ref; Official Gazette of the United States patent Office, Vol 973, no 5, p 2312, August 29, 1978.

Descriptors: *Patents, *Water pollution treatment, *Water quality control, Streams, Running water, Storm runoff, Equipment, Debris collection.

An apparatus is provided for collecting debris floating in a stream and the apparatus in one form may comprise a collector placed astride the stream with a first part arranged to engage and intercept floating debris. Another part is pivotally mounted downstream from the first part and above the surface of the stream. Lift means secured to the collector adjacent the first part controls the elevation of the first part in accordance with variations in the level of water in the stream. (Sinha - OEIS)

Societe Generale de Constructions Electriques et Mecaniques Alsthom, Paris (France). (Assignee)
J. Pichon
U.S. Patent No. 4,111,809, 9 p, 5 fig, 22 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 331, September 5, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water quality control, Equipment, Separation techniques, Centrifugation, *Flotation, Oil collection, Suction.

The floating apparatus comprises a cyclone carrying a normally submerged dam forming with the body of the cyclone a water compartment containing the cyclone inlet orifice. The sill of the dam is situated below but close to the free surface of the body of water from which the pollutant is to be removed and such sill is formed to create a continuous flow of water and pollutant into the compartment to form a level of the mixture lower than that of the free surface of the body of water. The dam has a height enabling the level of water in the compartment to be maintained constantly higher than the inlet orifice of the cyclone. Suction means are connected to the lower outlet for filling the cyclone up to its ceiling with the liquid mixture from the compartment. A cyclonic rotation is produced capable of separating the water and pollutant by centrifugation and concentrating the pollutant in an axial central zone of the cyclone, and for removing the water freed from the pollutant through the lower outlet of the cyclone. Another suction means removes the separated concentrated pollutant through the ceiling of the cyclone. Means are provided to adjust the inlet flow of the cyclone so as to maintain the level of the mixture in the compartment at a constant height. (Sinha-OEIS)

APPARATUS FOR COLLECTING EFFLUENT OIL,
Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo (Japan). (Assignee).
S. Fukuda, Y. Seiki, M. Iizuka, H. Kasai, and M Enami.
U.S. Patent No. 4,111,811, 12 p, 11 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, No 1, p 331-332, September 5, 1978.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water pollution treatment, Water quality control, Weirs, Equipment, Oil collection, Suction.

An improved apparatus for collecting effluent oil floating on a water surface utilizes a pair of side plates placed in a forwardly opened arrangement, a weir which is inclined in a rear-downward direction with its opposite side edges contacted to the inner wall surfaces of the side plates under the water surface, and a slant plate which as its rear end positioned above the rear end of the weir and has its opposite side edges secured to the inner wall surfaces of the side plates. An oil leakage preventing plate is positioned midway between the rear end of the weir and the read end of the slat plate and is secured to the inner wall surfaces of the side plates to form a water discharge port and an oily water intake port between the oil leakage preventing plate and the rear end of the slant plate. The oily water intake pipe is connected with the oil water intake port and a float is mounted to the side plates. In addition, wave buffering chambers are positioned above the slant plate and the intake port to help absorb the kinetic energy of wave action forced against the intake port. (Sinha-OEIS)

POSSIBILITY OF RENDERING BLEACHERY EFFLUENTS HARMLESS BY TECHNOLOGICAL CHANGES (UEBER DIE MOEGLICHKEIT BLEICHEREIABWAESSER DURCH TECHNOLOGISCHE AENDERUNGEN UNSCHAEDLICH ZU MACHEN),
Vyskumny Ustav Papieru a Celulozy Bratislava (Czechoslovakia). Forschungsinstitut fuer Zellstoff Und Papier.
J. Schmied, and J. Gajdos.
Wochenblatt fuer Papierfabrikation, Vol. 106, No. 10, p 375-378, May 31, 1978. 5 fig, 9 ref.

Descriptors: *Bleaching wastes, *Water pollution control, *Sulfite pulp mills, *Water reuse, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Ammonia, Sodium compounds, Magnesium compounds, Lignins, Chlorine, Pulp wastes, Pulp washing, Closed systems, Sodium hydroxide, Magnesium chloride, Chlorine dioxide, Water conservation.

The possibility of closing the water circuit of a sulfite pulp mill, specifically by circulating the bleachery effluent back to unbleached pulp washing and then to chemical recovery, is particularly applicable to magnesium bisulfite pulping. Points relating to the success of such operation include pulping to low kappa number, substitution of chlorine dioxide for liquid chlorine in chlorination, use of ammonia instead of NaOH in the extraction stage, effect of magnesium chloride on the reaction of lignin with chlorine and chlorine dioxide, and the optimal use of chlorine dixoide in bleaching to various degrees of whiteness. (Ward-IPC)
W79-02360

POSSIBILITIES AND MEASURES IN THE PULP INDUSTRY IN THE INTEREST OF ENVIRONMENTAL PROTECTION (MOEGLICHKEITEN UND MASSNAHMEN DER ZELLSTOFFINDUSTRIE IM INTERESSE DES UMWELTSCHUTZES).
Umweltschutz, Vol. 14, No. 12, p 302, 304-310, 1977.

Descriptors: *Pulp and paper industry, *Water pollution control, *Austria, *Air pollution control, Foreign countries, Europe, Pulp wastes, Bleaching wastes, Water pollution sources, Sulfite pulp mills, Kraft mills.

This is a general review of the pollution control program of the Austrian pulp industry. Research and development in the area of reducing and treating sulfite and sulfate (kraft) pulping effluents and pulp bleaching effluents and controlling sulfite and sulfate mill air pollution are reviewed. Recent pollution control measures taken at specific Austrian mills are outlined. (Speckhard-IPC)
W79-02369

PULP INDUSTRY AND WATER POLLUTION CONTROL (ZELLSTOFFINDUSTRIE UND GEWAESSERSCHUTZ),
H. Fleckseder.
Umweltschurz, Vol. 14, No. 12, p 288-293, 1977. 4 fig, 1 tab.

Descriptors: *Water pollution control, *Pulp and paper industry, *Sulfite pulp mills, Wastes, Industrial wastes, Water pollution sources, Pulp wastes, Chemical oxygen demand, Biochemical oxygen demand, Carbon, Water pollution, Bleaching wastes, Sulfite liquors, Neutralization, Waste water treatment, Waste treatment, Water pollution treatment, Filtration, Flotation, Sedimentation, Condensates.

COD, BOD, and total organic carbon (TOC) are discussed as indices for describing the level of pollution of pulp mill waste waters, and process measures for reducing the pollution load of such waste waters are reviewed. The pollution load of a magnesium-base sulfite pulp mill is compared to that of a calcium-base sulfite pulp mill. It is shown that BOD can be reduced to about 20 kg/ton of pulp and COD to about 50 kg/ton of pulp at 99% liquor recovery in a system where 70% of the organic load from bleaching is combined in liquor recovery and where 50% of the organic load remaining after spent liquor neutralization is removed from the condensate via stripping. Possibilities for effluent treatment (filtering, flotation, sedimentation) to reduce this load further are also reviewed. (Speckhard-IPC)
W79-02370

INTERIM RECOMMENDATION FOR THE USE OF BUFFER STRIPS FOR THE PROTECTION OF SMALL STREAMS IN THE MARITIMES,
New Brunswick Dept. of Fisheries and Environment, Fredericton. Maritime Forest Research Center.
H. van Groenewoud.
Canadian Forestry Service, Information Report M-X-74, 21 p, 1977. 1 fig, 1 illus, 30 ref.

Descriptors: *Lumbering, *Forest watersheds, *Water pollution control, Clear-cutting, Water pollution sources, Cutting management, Land clearing, Runoff, Watershed management, Pulp and paper industry, Wood wastes, Water pollution, Surface waters, Streams, Heating, Silting, Springs, Bogs, Buffer strips, Logging equipment, Soil conservation.

The detrimental effects of clearcutting stream banks and other logging practices are discussed, and preliminary recommendations are made for the use of buffer strips to minimize these effects. A 65-m (200-ft) wide buffer strip is not always necessary for protection against heating of the stream water. On relatively flat terrain, a buffer strip as narrow as 15 m (50 ft) will provide adequate protection against both heating and sediments. On moderately sloping terrain a 65-m (200-ft) strip is adequate if reasonable care is taken in the laying out of skid trails and haul loads. The buffer strip should extend the full length of the stream and also protect the major springs. Logging equipment should not be allowed to cross the buffer strip except where adequate protection measures have been taken. In boggy areas bordering streams, cutting by chain saw and hauling by cable can be allowed up to 15 m from the stream. (Witt-IPC)
W79-02384

RANGE CATTLE IMPACTS ON STREAM WATER QUALITY IN THE COLORADO FRONT RANGE,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, CO.
S. R. Johnson, H. L. Gary, and S. L. Ponce.
Department of Agriculture, Forest Service Research Note RM-359, 8 p, September, 1978. 2 fig, 1 illus, 14 ref, 2 tab.

Descriptors: *Water quality, *Pastures, *Cattle, *Colorado, *Surface waters, Grazing, Ranges, Bacteria, Water pollution, Water pollution sources, Livestock, Trout Creek(Colorado).

Studies on two adjacent pastures along Trout Creek in central Colorado indicated only minor effects of cattle grazing on water quality, but bacterial contamination of the water increased significantly. When the cattle was removed, bacterial counts dropped to levels similar to those in the ungrazed pasture. (Witt-IPC)

ACID MINE DRAINAGE AND SUBSIDENCE: EFFECTS OF INCREASED COAL UTILIZATION,
Industrial Environmental Research Lab., Cincinnati, OH.
R. D. Hill, and E. R. Bates.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 092, Price codes: A03 in paper copy, A01 in microfiche. Final Report No EPA-600/2-78-068, April 1978. 38 p, 2 fig, 11 tab, 18 ref.

Descriptors: *Acid mine water, *Mine wastes, *Coal mines, *Settlement, *Waste treatment, Mine drainage, Subsidence, Soil management, Soil engineering, Soil stability, Slope stability, Groundwater resources, Aquifers, Legislation, Surface mining control and reclamation act.

In 1969, it was estimated that over 10.000 miles of streams had been degraded by acid mine drainage (AMD), a unique pollutant, because acid generation and discharges continue after mining has ceased. Underground mines contribute over 70% of the AMD, of which a significant amount is contributed by inactive mines. Subsidence, the instability within rock created by the void resulting from mining operations, disturbs natural drainage areas, sewage lines, roads, and bridges, and can intercept groundwater supplies, diverting them to deep mines. Projected increases of AMD and subsidence beyond the 1975 levels for the years 1985 and 2000, based on current mining trends and the National Energy Plan (NEP), are presented. No increases are projected for AMD from surface mines or waste, because enforcement under present laws is expected to control this problem. AMD from underground mines is expected to increase

16% in 1985 and 10% by 2000; subsidence is projected to increase 34% in 1985 and 115% by 2000. The smaller increase in AMD in 2000 over 1985 reflects the impact of Public Law 96-87, the abandoned mine program. The projected subsidence figure for the year 2000 may be smaller if subsidence control measures are adopted. Available AMD control and treatment technology are summarized, and subsidence cause and effect control are discussed. It is recommended that AMD point discharges be treated during active mining, and that Federal, State and local governments cooperate to address subsidence problems. (Davison-IPA)

SURVEY OF ENVIRONMENTAL REGULATIONS APPLYING TO GEOTHERMAL EXPLORATION, DEVELOPMENT, AND USE,
WAPORA, Inc., Washington, DC.
G. V. Beeland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 023, Price codes: A12 in paper copy, A01 in microfiche. Final Report No EPA-600/7-78-014, February 1978. 254 p, 3 fig, 14 tab, 19 ref, 13 append. 68-03-2371.

Descriptors: *Legislation, *Environmental control, *Geothermal development, Air pollution, Water pollution, Solid wastes, Waste disposal, Waste identification, Landfills, Water quality, Toxicity, Subsidence, Sedimentation, Permits.

A survey of the local, State, Federal and federally approved ordinances, statutes, regulations, and standards designed to minimize adverse environmental effects of pollution sources in the production and use of geothermal resources is presented. The areas of greatest concern include: air and water pollution control, noise reduction, land disposal of wastes, subsidence control, radiation control, and erosion and sedimentation control. Analyses of the regulations are made with regard to resource definition, pollutants currently not controlled, duplicity and overlaps in permit and impact assessment requirements, the lack of uniformity between states, and the probable future approaches to the regulatory problems. (Davison-IPA)

HAZARDOUS MATERIAL SPILLS: A DOCUMENTATION AND ANALYSIS OF HISTORICAL DATA,
Factory Mutual Research Corp., Norwood, MA.
J. L. Buckley, and S. A. Weiner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 090, Price codes: A11 in paper copy, A01 in microfiche. Final Report No EPA-600/2-78-066, April 1978. 244 p, 48 fig, 8 tab, 9 ref, 9 append. 68-03-0317.

Descriptors: *Accidents, *Hazards, *Spills, *Documentation, *Data collections, Negligence, Equipment failure, Statistics, Industrial operations, Safety, Water pollution, Analysis.

The goal of this study was to further hazardous material spill prevention by gathering and analyzing spill data to provide guidance for future research. Of the 1500 incidents scanned, 10% were documented as hazardous, and a computer program was prepared to provide the desired sorts. Frequency distributions of the data were obtained as a function of the operational areas, primary cause, and other significant information for each spill incident. A hazard potential scheme was developed to rank spills according to their potential severity, which listed quantity and toxicity of the material, so that comparisons of the spills could be made. The frequency distribution by Hazard Potential Category for primary causes and operational areas, such as in transit, loading-unloading areas, in plant storage and in plant processing, were used to distinguish and evaluate problem areas. ANALYSIS OF THE ENVIRONMENTAL CONTROL TECHNOLOGY FOR OIL SHALE DEVELOPMENT,
Utah Univ., Salt Lake City. Coll. of Engineering
N. deNevers, D. Eckhoff, S. Swanson, B. Glenne, and F. Wagner.
Available from the National Technical Information Service, Springfield, VA 22161 as COO-404301, Price codes: A13 in paper copy, A01 in microfiche. Report No COO-4043-1, February 1978. 300 p, 50 fig, 22 tab, 111 ref, 8 append. EY-76-S-02-4043

Descriptors: *Oil shales, *Water pollution control, *Air pollution control, *Waste disposal, Clean Air Act, Water Quality Act, Waste treatment, Solid wastes, Effluents, Emissions, Vegetation establishment, Erosion control, Strip mines, Strip mine wastes, In-situ retorting, Surface retorting, Land tenure.

The proposed environmental control technology for the various oil shale projects now under development are comprehensively examined. Emphasis is on the application of the technologies to the three Federal prototype lease projects: C-b, Rio Blanco, and White River, as well as two others, where including them seemed appropriate. Control of air pollution, water pollution, and disposal, stabilization and vegetation of the processed shale were investigated. Basic air pollution control will be to minimize the emissions of recognized air contaminants through the utilization of technologies applied by related industries. Prevention of any surface or subsurface flow of contaminated water leaving the shale processing site will be the basis for water pollution control strategy. Two of the three Federal lease projects have converted from strip mining and surface retorting to in-situ retorting. A comparison of in-situ and surface processing from an environmental viewpoint is presented. (Davison-IPA)

MANPOWER UTILIZATION AND FUTURE NEEDS OF MANUFACTURING INDUSTRIES IN WATER POLLUTION CONTROL,
Utah State Univ., Logan. Coll. of Engineering.
E. J. Middlebrooks.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 689, Price codes: A06 in paper copy, A01 in microfiche. June 1974: 105 p, 16 fig, 30 tab, 11 ref, 1 append. 5-SF-WP-1.

Descriptors: *Manpower, *Manpower projections, *Waste water treatment, *Personnel management, *Projected planning, *Water quality standards, Occupations, Labor supply, Forecasting, Long term planning, Industrial wastes, Water pollution treatment.

Future manpower requirements in industrial waste water treatment are discussed. Data derived from the 1968 Census of Water Use in Manufacturing, and Environmental Protection Agency (EPA) poll, and an Environmental Science Services Corporation (ESSC) report were used to develop the total numbers of personnel in various industry categories working on water pollution control, and to develop staffing models for the occupational categories. Projections made with ESSC models appear to be more realistic than those made with EPA models, because too little data on large plants was available. Estimated manpower involved in industrial water pollution control during 1974 was from 540,000 to 900,000, with a projected increase of 300 to 400% for the following five years. It is anticipated that the rate of increase in work force would be directly related to the rate at which new treatment standards will be implemented and enforced. The increased work force will result in the need for intensive educational and training programs to upgrade existing plant personnel, and to facilitate advanced treatment concepts and automation. Although plant automation may reduce the number of personnel directly employed in waste water treatment, skilled operators and technicians will be needed to calibrate and control the facilities. Much of the material presented is tabulated with regard to the type of industry, the quality and quantity of its effluent, the number of people in waste water treatment, and the jobs associated with waste water treatment. (Davison-IPA)

FISH FARMS ARE HAVING TO WATCH THEIR WASTE.
Vandkvalitetsinstitutet, Hoersholm (Denmark)
Fish Farming International, Vol. 5, No. 3, p 19, 1978. 1 tab.

Descriptors: *Fish farming, *Nutrients, *Waste water treatment, *Settling basins, *Aquiculture, Farm ponds, Fish harvest, Fish management, Water pollution sources, Animal wastes(Wildlife), Suspended solids, Fish hatchery, Commercial fish

The rapid development of fish farming has focused attention on the ecological problems generated by the discharge wastes from these farms. Pollutants consist mainly of unconsumed fish feed and fish feed wastes. This article reports on a Danish attempt at using settling tanks to reduce the discharged suspended solids. The authors report that by utilizing the tanks a decrease of up to 80% in suspended solids was obtained. (EIS-Deal)

THE EFFECTS OF SOME BASIC STATISTICAL AND BIOLOGICAL PRINCIPLES ON WATER POLLUTION CONTROL,
British Columbia Univ., Vancouver. Faculty of Commerce and Business Administration.
H. D. Drechsler, and P. N. Nemetz.
Water Resources Bulletin, Vol. 14, No. 5, p 1094-1104, October 1978. 7 fig, 1 tab, 11 ref.

Descriptors: *Water quality standards, *Water quality control, *Water pollution control, *Water policy, Regulation, Monitoring, Sampling, Pollutant identification, Data collections, Statistical methods, Reliability, Analytical techniques, Toxicity, Bioassay, Methodology.

The hypothesis of this paper is that the frequently used regulatory practice which employs point estimates in water pollution control objectives, in combination with monitoring at infrequent intervals, is an inadequate scientific procedure for the measurement and control of pollution. The first part of this paper outlines the relevant sampling theory which applies to the measurement of effluent from industrial plants and describes the possible errors in sampling practice which currently affect the interpretation and enforcement of environmental standards. In the second part of the paper, the authors describe briefly the environmental significance of biological damage functions. In the final part of the paper, the authors recommend that existing pollution control regulations be restructured to be more efficient and effective in the protection of both corporate and social interests. By adopting two different approaches to regulation depending upon the nature of the appropriate damage functions and critical fish species, it is possible to reduce significantly the waste of resources.

A SIMULATION MODEL FOR RESOURCE POLICY EVALUATION,
W. E. Tyner, and R. J. Kalter.
Cornell University, Ithaca, NY, Department of Agricultural Economics, Paper 76-35, 1976. 47 p, 7 fig, 3 tab, append. NSF SIA74-21846.

Descriptors: GEN2 model, *Simulation analysis, *Computer models, *Natural resources, *Policy, *Evaluation, *Methodology, *Model studies, Monte Carlo method, Economics, Resources development, Federal government, Leases, Private sector, Public sector, Computer programs, Governments, Costs, Subsidies, Investment.

The Generalized resource Policy Evaluation Model, GEN2, incorporates discounted cash flow techniques to simulate private sector response to public resources policies. Such response tends to be similar regrdless of resource. The model is useful for evaluating government policy questions relating to disposition of publicly owned natural resources. An appendix contains operating instructions both for the model and for the program input sequence. The model, written in FORTRAN, can analyze a wide range of leasing policy systems, including bonus bidding, royalty, and Indian production sharing, as well as other policy options such as tax policies, price subsidies, purchase guarantees, price supports, investment subsidies, and other options designed to increase certainty for private investors. Ouputs include statistics on production time horizon, installed capacity, and present value of royalty payments, depletion, taxes and taxable income, profit share or production share payments, production reserves, investment and operating costs, gross revenue, and after tax net present value. Additional outputs are provided for such specialized leasing or other policy options as the royalty bidding system. Monte Carlo simulation with uncertain variables makes it possible not only to determine the change in expected value of outputs when a policy variable is changed, but also the change in variance of outputs. GROWTH AND OPTIMAL GROWTH WITH RENEWABLE AND NON RENEWABLE NATURAL RESOURCES,
London Univ. (England).
P. C. Thanh.
Queen's University of Kingston, Ontario, Canada, Institute for Economic Research; Discussion Paper No. 264, (1977), 52 p, 6 fig, 27 ref.

Descriptors: *Optimization, *Economic growth, *Mathematical models, *Natural resources, Model studies, Economics, Competition, Reviews, Conservation, Profit, Resource allocation, Marginal utility, Consumption.

Natural resources are examined in the context of economic growth, and a review of literature is given. The free competitive market cannot be relied upon to bring about best natural resources use. Efficient growth is only compatible with greatest protection of renewable resources. For growth under competition a 'golden rule for resource utilization' is described: In a competitive economy dependent on natural resources, steady growth is possible only if the ratio of resource utilization to the resource stock is constant; the saving ratio is proportional to the profit share (ratio of output growth rate and sum of output growth rate and resource utlilization rate). The most efficient growth path for exhaustible resources is one in which the saving ratio is nearest to the profilt share, and the renewable resources one in which the natural growth rate of resources is at its maximum. The section of the study on normative aspects yields two theorems: (1) for each value of marginal utility elasticity there is a rate of pure time preference whereby the consumption program of an optimizing economy will be the same for both exhaustible and renewable resources; and (2) the asymptotic growth rate of per capita consumption will be negative in an exhaustible resource economy and positive in one with renewable resources if there is a strictly positive pure-time preference rate, without technical progress or population growth, but with an optimal consumption program. AN ANALYSIS OF NETWORK COSTS: A STUDY OF SYDNEY'S WATER SUPPLY FROM 1890 TO 2001, PART I: RESEARCH METHODS,
Australian National Univ., Canberra. Research School of Social Sciences.
B. M. Firestone.
Australian National University, Urban Research Unit Seminar Paper, EWP 470/77, 1977. 56 p, 16 tab, 30 ref, 3 append.

Descriptors: *Sydney(Australia), *Water supply, *Networks, *Costs, *Economics, *Methodology, *Water consumption(Except consumptive use), Forecasting, *Australia, Municipal water, Reservoirs, Urbanization, Water demand, History, Water rates, Analytical techniques, Population, Financing, Replacement costs, Planning, Decision making, Investment, Economics of scale.

Part I of a study of network costs of the Sydney, Australia water supply system describes the methodology used; part II will explain network costs and relate them to cost projection sensitivity. Aggregate capital and operating costs are given for 1890-1976, and are projected for 1976-2001. This paper postulates hypotheses, describes data and analytical problems in testing data, and presents cost projections. The project is a component of a broader study of the water supply and sewerage experience of several urban areas, aimed at evaluating: (1) returns to scale of this type of urban infrastructure; (2) effects of urban growth patterns on network costs; (3) impacts of residential density on network costs; (4) the 'gressivity' of charging systems; (5) rising finance and replacement costs; (6) the impact of standards and design practice on investment levels; (7) relationships of costs to prices; and (8) the relationship between demand price and supply price for investment decisions. Sydney's population grew from about 354,000 in 1890 to 3.1 million in 1976. Per capita demand has risen from 125 liters/day in the early 1890s to over 470 liters/day in the 1970s. Accounting unit costs are expected to increase from $.103/1000 liters in 1971 to $.205 in 2001, a 99% increase. Unit replacement costs will increase from $.381/1000 liters in 1971 to an estimated $.673 in 2001 (77%). (Lynch-Wisconsin)

Descriptors: *Natural resources, *Economic development, *Regional development, *Canada, *British Columbia(Canada), *Staple theory, *Forests, *Pulp and paper industry, Oil, Energy, Population, Economic growth, Regional analysis, Economics, Income distribution, Resources development, Tariff, Model studies, Linear programming, Computer models.

A study of the role of natural resources in Canada's regional economic disparities contradicts the 'staple theory' of traditional Canadian economics and supports conclusions of the Economic Council of Canada's 1977 study. The latter attributed economic disparities to differences in productivity and technical, aggregate demand, and urban structure, rather than to natural resources, exports of staples, transportation, and tariffs. The present study uses aggregate measures and multi-regional linear programming models of forest products, gold and base metals, asbestos, and energy. Results strongly suggest that under the current forest resource pricing method in British Columbia, natural resource rents have inflated wage payments in manufacturing, resulting in: (1) the manufacturing sector priced almost out of existence, (2) high local cost of living, (3) inemployment, and (4) stimulation of inmigration despite unemployment. Other conclusions: (1) interregional migration is ineffectual in changing long-run wage rates: (2) in a competitive trading region (unlike British Columbia), the general wage level is determined in nonprimary trading sectors, independently of the natural resource endowment; (3) some surpluses in resource industries are monopoly profits, not Ricardian economic rents; and (4) government equalization transfer of economic rents have been smaller than transfers under the oil export tax/import scheme or Churchill Falls power agreement. ON THE OPTIMAL POLICY FOR EXPLOITING RENEWABLE RESOURCE STOCKS,
Victoria Univ. of Manchester (England).
J. McInerney.
Journal of Agricultural Economics, Vol 29, No 2, p 183-188, May 1978. 2 fig, 2 ref.

Descriptors: *Mathematical models, *Natural resources, Economics, *Renewable resources, *Optimization, *Policy, Model studies, Resource allocations, Cost-benefit analysis, Marginal costs, Marginal benefits, Discount rates, Demand, Planning, Public benefits.

The author revises his analysis of 'destructible, renewable stock resources' in a previous paper on natural resource economics (1976), which contained certain errors. Two aspects require revision: (1) discussion of optimal allocation of the resource stock (marginal net benefits equal in each period) and the accompanying figure (erroneously showing the equality of marginal gross benefits) were both incorrect and (2) explanation of the derivation of user costs of current consumption was incomplete and the marginal user cost curve was thereby inaccurately specified. The full model for renewable resource stocks is presented again. The analysis assumes: (1) a planning horizon for the present and the future; (2) an initial resource stock growing by a constant proportion, with all available resource units consumed by the end of 'the future'; (3) knowledge of current and future resource demand curves measuring marginal social benefits (MSB) gained from consumption; (4) constant marginal resource extraction costs (MEC) for each period; and (5) future MSB and MEC expressed in present values, with discount rates reflecting society's time preference. The optimal resource utilization (or conservation) policy is that interperiod allocation pattern which maximizes aggregate net benefit to society from its resource stock, implying a balance between marginal net benefit of consumption in each period. ISSUES IN WATER DEVELOPMENT DECISIONS: A DISCUSSION PAPER,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Engineering.
G. Levine.
Economic Bulletin for Asia and the Pacific, Vol 27, No 2, p 109-117, December 1976.

Descriptors: *Planning, *Water resources development, *Decision-making, *Planning, *Theoretical analysis, *Irrigation, Flood control, Reservoir design, Drainage, Financing, Multiple-purpose projects, Crop production, Agriculture, Land values, Benefits.

Major issues in water resource development are identified and analyzed. Though emphasizing irrigation, the discussion applies also to flood protection, drainage, and power development. Issues are posed as either/or situations for clarity. A general issue is how uncertainty at the project decision stage and project design stage can be dealt with, including: (1) water-based development vs other bases, (2) utilization of natural rainfall vs irrigation, (3) single vs multi-objectives, (4) autonomous vs directed development, (5) private vs public projects, (6) new projects vs rehabilitation of older ones, (7) large vs small projects, (8) staging and phasing, and (9) who pays--the farmer or 'others' Uncertainties in decision and design parameters relate to data defining the basic water resources, estimated reservoir storage life, drainage, plant disease, and public health, compounded at the design stage by almost complete exclusion of the human factor in deriving design parameters. Some evidence suggests that more arid areas emphasize directed projects, while in more humid regions autonomy is more common. New projects usually will result in land value increases and changes in crop production, while rehabilitation will have a lesser impact on such aspects. Large projects more efficiently use limited human resources and physical elements, are more easily financed, and generate major benefits even during the construction period. (Lynch-Wisconsin)

ECONOMETRIC ANALYSIS OF ENVIRONMENTAL POLICY: ESTIMATION OF A MODEL OF THE CANADIAN PULP AND PAPER INDUSTRY,
McMaster Univ., Hamilton (Ontario)
R. A. Muller
Canadian Journal of Economics, Vol 11, No 2, p 263-286, May 1978. 2 tab, 11 ref, 1 append.

Descriptors: *Pulp and paper industry, *Canada, *Mathematical models, *Econometrics, *Pollution abatement, *Economic impact, *Costs, Economics, Model studies, Estimation, Policy, Industrial production, Prices, Newspring, Export, International trade, Input-output analysis, Regulation, Simulation analysis.

An econometric model of the Canadian pulp and paper industry, designed to simulate effects of changes in production costs due to mandatory pollution controls, is specified and estimated. Expected costs of pollution control should not depress output more than 2% if cost increases average about 6%. In simulation runs the model tracked long-term fluctuations in major variables with tolerable accuracy. It consistently demonstrated low sensitivity to random variables, with less than unitary elasticities of major variables with respect to real income changes, unit factor requirement changes, and exchange rate variation. This insensitivity persisted despite a series of modifications of numerical parameters. The main qualitative conclusions remained unchanged when various coefficients were altered by an amount equal to their standard error. The basic model was specified to reflect the oligopolistic nature of the industry. Three product groups were specified--newsprint, woodpulp export, and other paper and board--and a unique output determination model was applied to each. Increase in costs due to any particular environmental policy will vary with the level of treatment adopted, the pulping process used, and characteristics of individual mills. The model is general enough to be potentially useful for such issues as the impact of tax incentives or changes in foreign aggregate demand. (Lynch-Wisconsin)

IMPLICATIONS OF ALTERNATIVE MEASURES OF NATURAL RESOURCE SCARCITY,
Washington Univ., Seattle.
G. M. Brown, Jr., and B. C. Field.
Journal of Political Economy, Vol. 86, No. 2, p229-243, April 1978. 2 fig, 1 tab, 31 ref. NSF SIA 75-15189.

Descriptors: *Measurement, *Indicators, *Scarcity, *Natural resources, *Methodology, Economics, Unit costs, Prices, Rents, Mathematical models, Model studies, Costs, Renewable resources, Nonrenewable resources, Marginal discovery costs, Marginal replenishment costs, Technology, Resource extraction, Theoretical analysis,

Three commonly used indicators of natural resource scarcity--unit cost, product output prices, and rental rates--are evaluated as deficient. Rental rates or a proxy--marginal discovery costs--are preferred over the other measures, but none is ideal. In some cases good scarcity indicators may be nonexistent. Barnett and Morse's unit Cost measure, the most commonly cited scarcity index, is ambiguous and mistakes certain types of technological progress for growing natural resource sarcity, mistakes ease of adjustment to increasing scarcity for increasing scarcity itself, is a lagging rather than a leading indicator, and does not reflect expected future discovery or extraction costs. The real price of natural resource-intensive products is somewhat superior to unit cost as it reflects expected discovery and extraction costs, but technical progress distorts its scarcity signal. Real price can rise or fall depending on which price deflator is used to adjust the nominal resource price. Neither real price nor unit cost is a reliable scarcity indicator in common property situationss. Rental rates indicate increasing scarcity in an economic sense, but lack of data renders their use imparctical, and marginal discovery costs (or mariginal replenishment costs in the case of renewable resources) are more useful as indicators. Taylor and North's incorporation of economic uncertainty into benefit-cost analysis is extended through utilization of the Weibull probability distribution, which permits great flexibility in input values. The technique's major advantage is that absolute highest and lowest values in the range of input data need not be specified. The Weibull technique can use best estimates of these values, and allows for uncertainty by adjusting the probability of exceeding those values. Further application of these probability assignment procedures is easy and inexpensive. This paper demonstrates that inclusion of uncertainty in benefit-cost analysis need not be limited to triangular distribution. The technique is demonstrated in use with the Spewrell Bluff Dam Project, Georgia; results are compared with those of Taylor and North. Their subjective estimates (most likely, optimistic, and pessimistic) for Spewrell Bluff, obtained from interviews, are the basis for output comparisons of the Weibull distribution and triangular distribution. Input information for the Weibull distribution is combined by the required algorithm for the output measure specified, i.e., net benefits or benefit-cost ratio, and Monte Carlo techniques are used to simulate final output distribution. The outcome is the mean, standard deviation, and minimum and maximum values of the output distribution. (Lynch-Wisconsin)

STUDYING THE ECONOMICS OF A WATERWAY: A CRITIQUE OF STUDIES OF THE MCCLELLAN-KERR ARKANSAS RIVER NAVIGATION SYSTEM,
Cornell Univ. Agricultural Experiment Station, Ithaca, NY. Dept. of Agricultural Economics.
D. Allee, and W. Sander.
Paper No 77-10, April 1977. 28 p, 3 fig, 46 ref.

Descriptors: *McClellan-Kerr Arkansas River Navigation System, *Arkansas River, *Regional development, *Inland waterways, *Multiple-purpose projects, *Cost-benefit analysis, Navigation, Barges, Economic impact, Economic efficiency, Oklahoma, Arkansas, Tulsa(OK), Rivers, Economics.

Previous studies of the impact of the McClellan-Kerr Arkansas River Navigation System are reviewed, and priorities for future research are identified. Studies to date have dealt with economic efficiency or direct benefits, and intersector and interregional impact, with little attention to social equity in terms of benefit distribution and cost allocation. The project provides Tulsa, Oklahoma and four other cities with major public port facilities to service barge navigation; also included are flood control, water-based recreation, hydropower, and reliable water supply were additional benefits. Barge transport began in 1970, and by 1974 shipping amounted to 34.2 million tons valued at $500 million. Between 1970-75, 497 new industrial plants or additions were built, and the interstate highway system along the channel was expanded. Recreationists spent $192 million in 1975. Rebuilding the Arkansas River cost about $2 billion at current prices, and operation and maintenance costs are about $20 million per year. Return on invested capital is estimated at 4.0-13.5%. Total benefits appear to have exceeded costs. Of the $1.1 billion (1963 prices) for business inputs (half for labor), over 70% was spent in the region, and the project has generated $2 billion in income (50% in the region). Research needs include: (1) locational response to shifts in transportation cost structure, (2) effects of product demand on sector activity and income, and (3) waterway impact on entrepreneurial capacity. WATER UTILIZATION AND REALLOCATION IN CHILE: A STUDY OF THE PIRQUE VALLEY,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Economics.
L. L. Parks, and D. E. Hansen.
American Journal of Agricultural Economics, Vol 60, No 2, p 207-213, May 1978. 1 fig, 2 tab, 8 ref.

Descriptors: *Water allocation(Policy), *Water rights, *Water utilization, *Pirque Valley(Chile), *Irrigation, *Chile, Agrarian reform, Water supply, Cost-benefit analysis, Beneficial use, Governments, Policy, Economic efficiency, Agriculture, Linear programming models, Model studies, Economics, Optimization, Income distribution, Equity, Valleys.

Although the 1967 Chilean Agrarian Reform Law's Water Code requires equalization of water rights per-hectare in each homogeneous farming area, data from the Pirque Valley south of Santiago shows that costs of changing water allocations would probably exceed benefits; equal per-hectare water allocation would result in economic inefficiency and a worsened income distribution. While optimum economic water allocation would considerably improve income distribution, aggregate income gains would not exceed 5%. Alternative means of improving current inefficient or inequitable water allocations while maintaining the existing delivery system include: (1) 'turnos', in which water is deverted through one canal branch at a time rather than through all branches simultaneously; (2) increased use of farm reservoirs to capture night flow; and (3) water pricing, especially marginal-cost pricing. Each method has drawbacks, such as shortage of water control gates and damage to the unlined canals (method 1), effects on other canal associations (method 2), and lack of water-measuring devices and excessive transactions costs (method 3). The present system has several advantages, however, and appears in general to be relatively efficient and equitable. (Lynch-Wisconsin)

IS IT TIME TO DO A BENEFIT-COST ANALYSIS FOR THE LOCATION OF A POWER PLANT,
Cornell Univ. Agricultural Experiment Station, Ithaca, NY. Dept. of Agricultural Economics.
D. J. Allee.
Paper No 77-15, May 1977. 8 p, 11 ref.

Descriptors: *Power plants, *Sites, *Locating, *Cost-benefit analysis, *Cayuga Lake(NY), *Somerset(NY), Lake Ontario, Lakes, New York, Electric power plants, Environmental effects, Environmental economics, Planning, Decision making, Willingness to pay, Economics.

Benefit-cost analysis for deciding whether to grant a permit to New York State Electric and Gas Corporation for building a coal-fired power plant on Cayuga Lake or on Lake Ontario at Somerset rests on two criteria: (1) whether the power plant (the intermediate good proposal) makes economic sense without considering the impact on natural site values; and (2) whether advantages of locating the plant at Cayuga Lake outweigh the loss in unique natural values. The Somerset site would cost an additional $15 million in higher wage rates and a more expensive configuration for water intake and discharge, compared with Cayuga Lake. Methodology exists for estimating in dollars many nonmarket values required by such analysis, such as willingness of people to pay for the difference in cost between the two sites. Important factors to consider are traffic accidents and delays at grade crossings, increased taxes and expenditures for construction, and the relative uniqueness of the two sites. It is concluded that if benefits of preserving the natural site and benefits of constructing the plant are nearly equal, the decision should be delayed for reconsideration of possible effects, while if benefits of the natural site are significantly greater, the plant should not be located there. Technology is bound to increase the uniqueness of a natural area over time, and income effects will likewise augment the value of such areas. (Lynch-Wisconsin)

MEASURING NATURAL RESOURCES SCARCITY: THEORY AND PRACTICE,
Resources for the Future, Inc., Washington, DC. Quality of the Environment Program.
V. K. Smith.
Journal of the Environmental Economics and Management, Vol. 5, No. 2, p 150-171, 1978. 4 tab, 53 ref.

Descriptors: *Natural resources, *Scarcity, Theoretical analysis, *Methodology, Analytical techniques, *Scarcity indices, Economics, Policy, Econometrics, Static models, Dynamic models, *Model studies, Prices, Economic growth, Mathematical models.

A critique is presented of Barnett and Morse's scarcity indices developed in their study, Scarcity and Growth (1963), which evaluates implications of natural resource availability for economic well-being. Whereas they argued that there is no evi-

dence of growing scarcity of natural resources based on an empirical analysis, the present paper concludes that empirical evidence alone is not sufficient for such a determination. Barnett an Morse relied on two scarcity indices: (1) real unit cost of the particular extractive output, and (2) a price index for extractive outputs relative to the nonextractive sector. These indices are evaluated within comparative static and dynamic frameworks to develop a means of appraising candidate indices, and a simple econometric analysis is given of trend movements in the relative price series for various subsectors and the whole extractive sector. An expanded set of series data is used to reevaluate Barnett and Morse's conclusions. A fundamental problem implicitly ignored in this 'outcome' approach to natural resource scarcity is that it is assumed that all services of natural resources are traded on organized markets; movements in the relative values of nonmarket resources, such as common property environment resources, will not be accounted for in the scarcity indices. 'THE RELATIONSHIP BETWEEN FIRM AND FISHERY IN COMMON PROPERTY FISHERIES': COMMENT,
Connecticut Coll., New London. Dept. of Economics.
G. R. Visgilio.
Land Economics, Vol. 54, No. 1, p 100-103, February 1978. 1 fig, 1 ref.

Descriptors: *Fisheries, *Economics, *Firms, *Commercial fishing, *Limited entry, *Economic impact, Common property, Model studies, Mathematical models, Equilibrium, Boats, Boat size, Management, Regulation, Output, Marginal costs, Optimization.

Anderson's discussion (1976) of the relationship between firm and industry in a common property fishery is modified to allow for changes in vessel size after introduction of a management scheme restricting the number of vessels, but with no additional controls. Results show that a firm will build bigger boats when the price of effort exceeds its marginal costs in the long run. According to Anderson's model, the level of fishing effort equals the output of an individual fishing vessel, a departure from traditional fishery economic analysis in which vessel output has been depicted in terms of the vessel's catch rate. A graphic representation is used with comparative statics analysis to portray vessel and fishery at the open-access equilibrium and the effort level corresponding to maximum economic yield (MEY) of the fishery. Anderson explains a potential problem inherent in management efforts to achieve MEY by limiting vessel number without also controlling output of effort, but the short-run changes in vessel output identified may understate the magnitude of the management problem when the time period is extended to permit changes in vessel size. It is shown that in the long run each firm or vessel equates price to long-run marginal cost, and therefore constructs the appropriate vessel size or scale of plant. 'THE RELATIONSHIP BETWEEN FIRM AND FISHERY IN COMMON PROPERTY FISHERIES': REPLY,
Delaware Univ., Newark. Dept. of Economics.
L. G. Anderson.
Land Economics, Vol. 54, No. 1, p 104-105, February 1978. 2 ref., NSF/RANN 75-11205.

Descriptors: *Fisheries, *Economics, *Firms, *Commercial fishing, *Limited entry, *Economic impact, Common property, Model studies, Mathematical models, Equilibrium, Boats, Boat size, Management, Regulation, Marginal costs, Output, Rent, Cost-benefit analysis, Costs, Optimization.

A reply is offered to Visgilio's comments (1978) on the author's paper on a common property fishery in which a management scheme is introduced limiting the number of fishing vessels in order to achieve maximum economic yield. Visgilio predicts that firms will build bigger ships when their number becomes limited, in response to the price of effort exceeding its marginal costs in the long-run. While the present author agrees with comments regarding the long-run cost curves of individual vessels, especially those concerning the long-run marginal costs curves of the fishery as a whole before and after vessel number restriction, he disagrees that the extra effort produced by the larger boats will necessarily result in net losses. It is demonstrated that if the new cost level is lower, and if the new return per unit of effort is higher than the original cost level, it is possible for the new rent to be higher. An economic interpretation of these results is that with initial reduction of optimal-sized vessels, the individual owners will increase profits by expanding production, in the long-run being motivated to obtain a larger boat to produce this higher level of effort at a lower cost. Although there will be too much effort produced from a social point of view, potential net gains in welfare still are possible by producing the added effort at lower cost. COSTLY INNOVATION AND NATURAL RESOURCES,
A. J. Robson.
Western Ontario University, London, Ont., Canada, Department of Economics, Research Report 7707, 1977. 3 fig, 12 ref.

Descriptors: *Mathematical models, *Natural resources, *Technology, *Resource depletion, *Nonrenewable resources, Model studies, Renewable resources, Optimization, Economics, Investment, Innovation, Oil, Land, Hydroelectric power, Marginal utility.

An optimal model demonstrates basic symmetry between costly innovation and resource depletion; both phenomena affect the asymptotic growth rate, whereas capital accumulation does not. But there is no simple trade-off between innovation and resource depletion--less-productive innovation can mean faster exploitation of the depletable resouce; a larger output share for the depletable resource can imply less innovation and faster exploitation. Similarly, it is possible that more-efficient innovation can lead to a slower rate of exploitation of the resource. The Rawlsian criterion is treated as a limiting case, under which the rent from the depletable resurce could finance innovation, and no investment should occur. These paradoxes seem to moderate the Rawlsian position. The present paper models costly but continuous innovation, and considers two types of limited natural resources: (1) oil, which has a fixed initial stock and is depletable, and (2) hydroelectric power (or land), wich is in fixed flow supply, and although nondepletable, is equally nonaugmentable. The model assumes a constant fraction of output is used to finance innovation, and the rate of exploitation of the depletable resource is constant. These two factors are shown to be more fundamental than the savings rate since they affect the endogenous (asymptotic) growth rate. (Lynch-Wisconsin)
W79-02062

SOME EXTENSIONS OF THE ECONOMIC THEORY OF EXHAUSTIBLE RESOURCES,
Montana State Univ., Bozeman.
R. Cummings.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, NY. p 1-10, 1977. 15 ref.

Descriptors: *Nonrenewable resources, *Economics, *Theoretical analysis, *Mathematical models, *Resource extraction, Common property, Model studies, Natural resources, Optimization, Timing, Marginal costs, Mining, Economic efficiency.

An analytical model of exhaustible resource extraction describes the optimal time-path of production for a decision-making unit exploiting an exhaustible natural resource under two sets of assumptions: (1) management of production is centralized from a common property source, and (2) the decision-making unit is the firm, assumed to be sole owner of a resource stock as in the theory of the mine. In the first case, profits in the resource area are maximized by equating marginal production costs plus an area-wide user cost among all producing firms (similar to Gordon's requirement for social efficiency in the production from mines). Regarding the appropriated exhaustible resource (where costs increase due to cumulative production) the rate of extraction is reduced, the production period is extended, and the percentage rate of growth in marginal profits is reduced. These results extend earlier studies primarily in three ways: (1) with reference to the theory of the mine, the analytical description of the firm's optimal time-path of exploitation under conditions where costs are affected by cumulative production, is expanded and clarified; (2) the optimal time-path of production from a common property resource under central management is contrasted to Smith's industry model; and (3) possible Pareto optimal ramifications of the centrally managed common property resource are suggested. (Lynch-Wisconsin)
W79-02064

OPTIMAL UTILIZATION AND THE CONTROL OF FISHERIES,
A. Scott
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, NY., p 155-173, 1977. 4 fig.

Descriptors: *Fisheries, *Optimization, *Resource allocation, *Commercial fishing, *Fish management, Economics, Common property, Farms, Regulation, Marginal productivity, Use rates, Subsidies, Taxes, Equilibrium, Economic rent, Return(Monetary)

A study of optimal resource allocation in the fishery considers: (1) allocation among industries, (2) four forces affecting landings, and (3) methods of regulation. The first section discusses Gordon's analysis of allocation problems posed by the fishery as a type of common property resource, contrasting fishing and farming. Fishermen have lower incomes than farmers; whereas the farmer's return mixes rent, interest, profit, and wage; the fisherman's return omits rent, and includes a wage which is lower due to low opportunity cost. The fisherman's return also includes some profit and interest, which also are low because the share system gives capital a low return and capital immobility may give it a low opportunity cost. Resource allocation to the fishery may be too generous because of the share system, low mobility, and common property. Forces affecting the return from a particular fishery include: (1) diminishing returns wherein application of more labor time on a given vessel may mean a rise in cost per unit of fishing effort; (2) external diseconomies due to excessive number of vessels; (3) population effect, where extra effort reduces the stock of fish, resulting in permanent reduction of the equilibrium catch; and (4) allocation over time (equilibrium of a fish population with the economic system may take centuries). The section on regulation discusses vessel or fisherman limitations, fishing rights fees (as bids), sole ownership, a tax on the catch, and subsidies. (Lynch-Wisconsin)
W79-02065

OPTIMIZATION AND SUBOPTIMIZATION IN FISHERY REGULATION,
London School of Economics and Political Science (England).
R. Turvey
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, NY., p 175-187, 1977. 4 fig, 8 ref.

Descriptors: *Regulation, *Fisheries, *Optimization, *Commercial fishing, *Economics, Externalities, Model studies, Equilibrium, Costs, Marginal return, Policy, Mesh size, Fishing effort, Marginal productivity, Mathematical models, Fish management, Taxes

Static analysis of a single-trawl fishery illustrates effects of optimization or suboptimization of resource allocation in fishery regulation. In the case of higher demand, greater employment of industry resources occurs, but with smaller total product. Two problems cause this: (1) While the catch of an individual fisherman is proportionate to his own fishing effort, the same is not true of all fishermen together since each imposes an external diseconomy on the others, and the marginal private product of his fishing effort exceeds the marginal social product. (2) Use of smaller mesh size and thus catching smaller fish reduces the number of large fish to be caught later, and in the long run larger mesh size may lower costs of all fishermen together; again, social and private product diverge. Although it is clear that to achieve optimum resource allocation both variables must be regulated, this is not always the case in practice. Two recommendations: (1) a shift to the eumetric curve, and as an alternative (2) a reduction in fishing effort whenever the fishery is on a falling yield curve. Either will raise the catch and/or reduce costs. A complication of regulation of only one of the variables is that catch will initially be reduced. (See also W79-02067) (Lynch-Wisconsin)
W79-02066

OPTIMIZATION AND SUBOPTIMIZATION IN FISHERY REGULATION: COMMENT,
Minnesota Univ., St. Paul.
J. H. Boyd.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, N.Y., p 189-195, 1977. 2 fig, 1 ref.

Descriptors: *Regulation, *Fisheries, *Commercial fishing, *Optimization, *Economics, Externalities, Model studies, Mathematical models, Equilibrium, Costs, Marginal return, Marginal productivity, Mesh size, Fishing effort, Policy, Fish management, Taxes.

A critique of Turvey's 1964 paper (see W79-02066) on optimization and suboptimization in fishery regulation contends that it may not be optimal to require either or both: (1) a toll or charge per pound of fish caught, and (2) imposition of a legal minimum mesh size to protect immature fish, as stated by Turvey. There are in fact three possible optimizing prescriptions, depending on conditions: (1) no regulation, (2) a toll only, and (3) a toll plus a mesh-size regulation. Further, in the special case where Paretooptimality does require both types of regulation, there is no necessity to institute regulation by fiat to control mesh size; a penalty toll on all fish in a catch smaller than the minimum would accomplish the same end. The chief fault in Turvey's paper is a failure to clearly state the relationship of certain critical, implicit assumptions in his argument to his public policy conclusions. Three common assumptions are here assessed: (1) growth of fish and natural mortality are functions of age; (2) fishing mortality rate (catch) is proportional to effort; and (3) recruitment into the fish stock number of fish reaching catchable size) is exogenous. In the single-trawl fishery examined, two external diseconomies are identified by Turvey: (1) effort by one fisherman reduces fish available to others; and (2) fish caught when smaller will not be caught later as a larger and more valuable fish, likewise imposing additional costs on the industry. (Lynch-Wisconsin)

GENERAL EQUILIBRIUM WITH A REPLENISHABLE NATURAL RESOURCE,
Arizona Univ., Tucson.
V. L. Smith.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, N.Y., p 197-213, 1977. 7 fig, 5 ref.

Descriptors: *General equilibrium models, *Renewable resources, *Economics, *Natural resources, *Fisheries, *Welfare(Economics), Model studies, Mathematical models, Equilibrium, Groundwater, Hunting, Optimization, Use rates, Common property, Stability, Commercial fishing, Competition, Taxes, Quotas, Regulation, Utility.

Stationary general equilibrium in a two-commodity world is described where one commodity is produced from a common property replenishable resource such as an ocean fishery, hunting ground, or groundwater supply. Principal emphasis is on derivation of the production transformation set and its properties since this is where the effect of common tenure is manifest. Also treated is determination of the number of firms in each industry, allowing an extension of partial equilibrium concepts to general equilibrium. The paper discusses: (1) the competitive economy, (2) Pareto optimality, (3) the relationship of user charges and fishing quotas to Pareto optimality, (4) stability, and (5) allocation of firms between industries. In the competitive economy model welfare is unambiguously measured by the per-capita utility function. The Pareto optimal solution for the economy is obtained by maximizing utility subject to technological and biological constraints to determine fish biomass and the units of appropriated resource. A charge for using the social capital represented by the common property stock of fish can, in principle, be used to internalize the external production costs in the fishery; a quota on the fish catch can serve as an equivalent function. The stability of general competitive equilibrium requires that a change in fish biomass must change biological product less than the total harvest of fish after adjusting fishing labor to the new fish stock. (Lynch-Wisconsin)

MATHEMATICAL MODELS OF A FISHERY,
J. Crutchfield, and A. Zellner.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, N.Y., p 215-228, 1977. 2 ref.

Descriptors: *Mathematical models, *Fisheries, *Economics, *Commercial fishing, *Fish management, *Animal populations, *Production functions, Model studies, Population dynamics, Equations, Private ownership, Halibut, Prices, Demand, Supply, Costs.

Mathematical models of exploited and unexploited fisheries are described, and a microeconomic analysis of the management of a privately owned fish resource is presented. For the unexploited fishery, the basic relationship is: $dN/dt = rN(1-N/N_s)$, where dN/dt is the instantaneous rate of change of the fish population, N is the population at time t, and r and N_s are fixed quantities. To account for fishery exploitation, traditional economic considerations are incorporated into the biological model. The higher the price is with a given population the larger the quantity supplied to the market by fishing enterprises; also, the larger the population with a given price, the larger the quantity supplied. The biological constraint indicates that the net rate of change in the population is the natural rate of increase minus the amount taken by man per unit time. Effects of changes in consumer income and technological improvement are incorporated into the model. In maximizing profits, the owner is subject to three constraints: (1) a technological production function relating fishing effort and population to output, (2) a cost function for inputs, and (3) a biological constraint. Besides different specification of the production function, this approach differs from others in that the private owner is not assumed to take a sustained yield, with the result that the profit-maximizing solution depends on the interest rate. EXPLOITATION OF COMMON-PROPERTY REPLENISHABLE NATURAL RESOURCES,
University of Western Ontario, London.
C. G. Plourde.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, N.Y., p 229-239, 1977. 2 fig, 18 ref.

Descriptors: *Common property, *Renewable resources, *Fisheries, *Commercial fishing, *Economics, *Regulation, *International law, Externalities, Model studies, Mathematical models, General equilibrium models, Equilibrium, Quotas, Taxes, Optimization, Utility, Natural resources, Biomass.

A general equilibrium model of a two-commodity economy expands the theory of common property resources as applied to commercial fishing. The model assumes one of the two goods is produced using a common property natural resource; optimal exploitation of this resource is expressed as a control problem. Specific results are obtained by assuming restrictive properties on the functions describing biological growth, production of resource product, and social utility. Aspects analyzed are: (1) the model, (2) steady-state equilibrium for interior solutions, (3) the relation of steady-state biomass to other steady-state values, and (4) taxes vs. quotas in industry regulation. Fishing regulation has usually taken the form of seasonal quotas (e.g., halibut). If the quotas equal the maximum sustained yield, there is no a-priori reason for such programs to be optimal since how to achieve a desired steady state is not specified. The model presented here clearly specifies a desired steady state and how to achieve it from any initial point. Dynamic tax rates can be devised which have the same effect as quotas, while having the advantage of signalling changes in parameters. The tax has the effect of internalizing the common property externality through appropriation. Auctioning of fishing rights may be preferable to per-unit taxes. International control is needed. ECONOMICS OF WILDERNESS RESOURCES,
V. L. Smith.
In: Economics of Natural and Environmental Resources, Gordon and Breach, New York, NY., p 489-504, 1977. 5 fig, 7 ref.

Descriptors: *Economics, *Environmental economics, *Wilderness areas, *Natural resources, *Resource allocation, *Mathematical models, General equilibrium models, Model studies, Optimization, Scenery, National Parks, National Forests, Public access, Recreation, Recreational facilities, Value, Preservation, Environmental effects, Theoretical analysis, Control theory.

Control theory and stationary general equilibrium theory are used to study a model of public recreational wilderness resources which incorporates such elements as (1) external crowding diseconomies in consumption, (2) deterioration effects of resources use, (3) capacity of the resource for ecological adjustment to use, and (4) the public good aspect of a resource's wilderness value. Several types of equilibria are illustrated and compared: an optimal control solution with and without administrative cost, a corresponding free-use competitive solution, stationary state competitive solutions for undeveloped access technologies, and an optimal solution with administrative cost. Investment in easier access to scenic resources can result in crowding and resource deterioration to the detriment of all users. In many cases, society's best option may be preserving relatively high access costs of wilderness resources. Whereas economic analysis of recreational lands has been primarily concerned with principles and techniques of allocating and valuing land for preservation or recreation as opposed to industrial development, it has neglected managing, developing, and rationing aspects of the use of resources already allocated to recreation. Visitor use of primitive areas has been increasing much faster than use of National Parks in general; Colorado River excursions, for example, have increased 50-fold, compared with a two-fold increase in visits to the Grand Canyon through which it flows. FORESTED WETLANDS OF FLORIDA-THEIR MANAGEMENT AND USE,
Georgia State Univ., Atlanta. Dept. of Biology

C. H. Wharton, H. T. Odum, K. Ewel, M. Duever, and A. Lugo.
Center for Wetlands, Phelps Lab, University of Florida, Gainesville, Report DSP-BCP-19-77, June, 1977. 348 p, 202 fig, 13 tab, Final Report to Florida Division of State Planning, (Tallahassee).

Descriptors: *Wetlands, *Land use, *Planning, *Florida, *Swamps, Economics, Forests, *Management.

For public use, this manual summarizes information on the utility of swamps in maintaining a healthy and economically vital landscape for Florida and similar areas elsewhere. This summary draws on a series of research project on wetlands, regional planning of wetland regions, and especially on detailed studies in regional planning, and indications of their value to economic vitality. The volume is intended for land managers, planners, engineers, and citizens participating in the public process of fitting human settlements into the pattern of nature so as to maximize the total value. PLANNING AND MODELING IN URBAN WATER MANAGEMENT,
Hydrocomp, Inc., Palo Alto, CA.
A. S. Donigian, Jr., and R. K. Linsley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 891, Price codes: A08 in paper copy, A01 in microfiche. Report, October 1978. 163p, 16 fig, 12 tab. 70 ref, append. OWRT C-7090(No. 6222), 14-34-0001-6222.

Descriptors: *Model studies, *Mathematical models, *Urbanization, *Water management(Applied), *Decision-making, *Water resources planning, Flood control, Storm runoff, Water supply, Water quality, Recreation, Environmental effects, *Modeling survey, *Model applications, *Modeling costs, *Obstacles to modeling, Baton Rouge(LA.), DeKalb Co.(GA.), Howard Co.(MD.), Knox Co.(TN.), San Francisco(CA.), Seattle(WA.), Southeastern Wisconsin, Washington, D.C.

The past decade has witnessed the growth of mathematical modeling as a valid method of analysis of water resource problems. Results are described of a survey of 349 planning and public works agencies to evaluate and analyze the use of modeling for the planning and management of urban water problems. The goal was to determine the extent of model usage and the impact of modeling on policy and decision making. Forty-three (43) percent of the agencies indicated involvement in the use of urban water modeling, either directly or through consultants, and 31 percent never considered the use of a water model. Federal or state agencies and consultants were the major sources of urban water models. In 52 percent of 220 model applications described by the agencies, the modeling was considered to have had an impact on the plan or policy ultimately adopted. In essentially all the model applications, the modeling was evaluated as very useful or moderately useful and at least as useful as alternative techniques. Obstacles to modeling and information needs for effective planning are explored as a basis for recommendations to improve the use and effectiveness of modeling in urban water planning and management. The report also documents and examines in detail eight case studies of modeling applications by cities, counties, and regional agencies. The case studies include a variety of model types and water problems to demonstrate the utility of modeling for urban water planning and management.

CONSUMER SURPLUS AND ECONOMIC RENT ESTIMATES OF RECREATION VALUE: AN EMPIRICAL AND THEORETICAL COMPARISON,
Utah State Univ., Logan.
E. R. Meale.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 853, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, 1974. 113 p, 8 fig, 10 tab, 23 ref, 4 append. OWRT C-4371 (No. 9064)(1), 14-31-0001-9064

Descriptors: *Consumer surplus, *Economic rent, *Recreation, *Economics, Reservoirs, Lakes, *Boating, *Utah, Social values, Water sports, *Recreation demand, Recreation methodology.

Application was made of the consumer surplus and economic rent methods of resource valuation for boating recreation in Utah. Total consumer surplus and economic rent values were estimated for twenty-four boating sites. These values incorporate the relationship existing between the variable use costs and the units of activity associated with the site. The comparison of economic rent and consumer surplus was undertaken through the use of a common mathematical model and empirical observation. Three stages in the calculation procedure were considered in the analysis of the comparison of the two methodologies. The first stage compared the consumer surplus with the economic rent estimation and it was found that the economic rent will exceed the consumer surplus. The second and third stages compared the projected values for an origin visiting a site and the total value for a site. No unique relationship was found between the two resource valuation methodologies. The most significant factors contributing to the inconsistent relationship between economic rent and consumer surplus are the utilization of the number of trips in the economic rent model compared to the number of trips per capita in the consumer surplus model, the constant economic rent per trip compared to the decline in the consumer surplus for an additional trip per capita, and the respective projection factors of the two valuation methodologies.

AN ECONOMIC APPROACH TO WATER SUPPLY PLANNING IN SOUTHEASTERN VIRGINIA,
Virginia Polytechnic Inst. and State Univ., Blacksburg. VA. Dept. of Agricultural Economics.
W. B. Anderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 890, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1978. 22 fig, 15 tab, 2 append. OWRT A-076-VA(1).

Descriptors: *Water supply, *Water shortage, *Cost-benefit analysis, Economic efficiency, Water conservation, Waste water treatment, Treatment facilities, *Virginia, Chesapeake(VA), Norfolk(VA), Portsmouth(VA), Virginia Beach(VA), Lake Gaston, Blackwater River, Chowan River, Roanoke River, Appomattox River.

Projected levels of increased use of water in the southeastern Virginia cities of Portsmouth, Norfolk, Virginia Beach, and Chesapeake point to a need for additional sources of water. This research studied principal proposed approaches to this water-supply situation with the objective of developing an economically efficient response, given costs and benefits over time. Specifically, cost-benefit analyses were performed for projected levels of use and for reductions in those levels of use achieved with the use of quotas, price increases, and water-saving devices. An important element of these analyses was the consideration of the costs incurred as a result of waste water treatment with different levels of water use. The levels of the principal types of water use were estimated for each city. This provided a basis for the projection of water demand curves necessary for estimating the value of water. Optimal schedules for the development of additional water sources were derived through the examination of water demand, relative to the costs of operating and expanding water supply and waste water treatment facilities.

PROFILE AND MEASUREMENT OF SOCIAL WELL-BEING INDICATORS FOR USE IN THE EVALUATION OF WATER AND RELATED LAND MANAGEMENT PLANNING,
Texas Transportation Inst., College Station.
P. K. Guseman, and K. T. Dietrich.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper Y-78-2, June 1978. 166 p, 9 fig, 1 tab, 285 ref.

Descriptors: *Land management, *Planning, *Water management(Applied), Water resources development, *Social aspects, Social values, Attitudes, *Social well-being indicators.

As part of the continuing development of the Water Resources Assessment Methodology (WRAM), this report focuses on the Social Well-Being (SWB) account as defined by the Water Resource Council's Principles and Standards. An outline of SWB categories, subcategories, and variables as interpreted from Principles and Standards is included. In addition, for selected variables, definitions, information about measurement, and suggestions for prediction are provided. It is noted that although the set of variables discussed in this report assists in defining SWB, the list is tentative, not exhaustive, and is intended for use within the framework of WRAM. The particulars of each planning study and the judgment of professionals and publics will dictate omission of some variables and inclusion of others. (WES)

NINE FALLACIES OF NATURAL DISASTER: THE CASE OF THE SAHEL,
National Center for Atmospheric Research, Boulder, CO.
M. H. Glantz.
Climatic Change, Vol. 1, p 29-84, 1977. 58 ref.

Descriptors: *Psychological aspects, *Droughts, *Disasters, *Sahel, *Decision making, Project planning, Project post-evaluation, Attitudes, *Social aspects, *Political aspects.

The intent of this analysis is to document the hazards of discussing drought-related issues or forming recovery policies based on generalized and often incorrect beliefs. The generalizations shown to be fallacious in this analysis include: (1) people learn from their mistakes, (2) things will have to change, (3) nomads want to be nomads, (4) when the rains come, everything will return to normal, (5) education is the answer, (6) solutions can be undertaken on a piecemeal basis, (7) political leaders say what they mean, (8) the myth of interdependence, and (9) technology is the answer. When applied to specific situations, the belief in these fallacies is shown to be a hindrance rather than an aid in the understanding of the difficulties involved. Although here applied to the Sahel, the fallacies illustrated by this author can be hazardous in many drought-stricken areas of the world. (Tickes-Arizona)

he Dallas, Texas, water utility demosntrates that cal financing of water utilities is feasible without vernment subsidy. The Dallas utility has been erated by the local government with local fincing since 1936. Services can be rendered at st and at the lowest possible price if revenues are ailable and are protected from diversion to politl expedients. Under this system, local citizens y a fair user charge to the local or regional lity, which can be publicly or privately owned. allas had financed water resources development rough the year 2000 as well as a system of rification, production, and distribution capable supplying growth through 1985, through issuce of 20-year revenue bonds with a 1.5 coverage quirement. Water rates were increased only 20-% in 1951, 1955, 1959, 1969, and 1976. Four ervoirs have been built, also financed with 20-ar revenue bonds supported entirely by utility come. While local water rates were higher than st cities in the 1950s ad1960s, today they are almost comparable. In 1974 the average water rate for 60 large U.S. cities was $.13/cu m for 29 cu m/mo, compared with $.18 for Dallas (30% higher). The Dallas rate is now $.20, with the average income from sale of water about $.12/cu m. The economic impact of the Safe Drinking Water Act is illustrated with installation of a granular activated carbon treatment system. (Lynch-Wisconsin)

STRUCTURING WATER UTILITY BOND ISSUES TO COPE WITH INFLATION,
U. J. Schreiner.
Journal of American Water Works Association, Vol. 70, No. 9, p 496-497, September 1978.

Descriptors: *Public utilities, *Bond issues, *Inflation(Economic), *Water supply, *Financing, *Methodology, Municipal water, Water management(Applied), Investment, Capital, Arbitrage bonds, Advance refunding, Regulation, Legal aspects, Utilities, Timing, Interest rates, Economics.

Water utilities can structure bond issues to reduce borrowing costs, taking into account inflation, by means of two methods not widely employed by municipal utilities: arbitrage bonds and advance refundng. Bond issue planning must consider existing tax and water rates and bonds and advance refunding. Bond issue planning must consider existing tax and water rates and bond covenants, bond reserve requirements, market conditions, competing sales, and amount of outstanding bonds. If the money market looks favorable to the utility, the decision will favor long-term financing because of low interest rates on bonds; an unfavorable money market would suggest short-term financing or long-term financing with provision for early call and redemption of the long-term bonds in order to obtain lower interest rates. Project timing would consider availabiity of federal and state grants. In any municipal bond issue, federal regulations on tax-exempt bonds must be considered, especially those on arbitrage bonds in Section 103(c) of the Internal Revenue Code of 1954; the 'temporary period and the 'reasonably required reserve fund' must be understood. Advanced refunding enables an issuer to sell refunding bonds, to use the bond proceeds to buy taxable federal securities, and to place such securities in escrow for payment at or prior to maturity of the bonds being refunded. Advanced funding is useful for lowering net interest rates, reducing principal, consolidating debt, freeing cash reserves, relieving oppressive bond covenants, and avoiding imminent default. THE LONG-RUN MOVEMENT OF THE PRICES OF EXHAUSTIBLE RESOURCES,
Sussex Univ., Brighton (England).
G. Heal.
Economics Seminar Paper Series 77/1, 1977. 30 p, 5 fig, 6 ref.

Descriptors: *Nonrenewable resources, *Natural resources, *Economics, *Equilibrium, *Prices, *Theoretical analysis, Reviews, Competition, Model studies, Mathematical models, Substitution, Interest rates, Forecasting, Long-run analysis.

A theory of resource price movements derived from a review of the literature is presented, and empirical studies, primarily by Barnett and Morse and by the present author, are examined to see if they confirm the theory. Earlier literature leads clearly to the following theory: In market equilibrium under either perfect or imperfect competition resource prices will rise in the long run at a rate dependent on (and in some simple cases equal to) the rate of return on other assets, and will continue to move in this fashion until they approach limits set by substitutes costs; to the extent that such costs are influenced by research and development, upper limits they pose are not exogenous, but will depend on expectations about price movements and on the ability of cost-reducing innovators to secure the full social return to their acitivities. The empirical studies cited are far from conclusive about any of the important issues, and the theory therefore remains to be seriously tested. Work by the present author indicates clear connection between resource price movements and interest rates, and the process by which expectations are formed appears very important. The work of Barnett and Morse seems to contradict the a-priori expectations regarding long-run price movements, but factors which could reconcile the difference include increases in known stocks, cost reductions in the production of substitutes, and desequilibrium behavior of markets. THE PRICE OF NATURAL RESOURCES,
B. Csikos-Nagy.
Acta Oeconomica, Vol 18, No 3-4, p 213-225, 1977. 9 tab, 11 ref.

Descriptors: *Natural resources, *Prices, Theoretical analysis, *Oil industry, *Political constraints, *Economics, *International trade, Economic growth, Economic development, Monopoly, Diminishing returns, Rent, Industrialization, Scarcity, Energy, Developing countries, Profit, History, Export.

A historical survey of theories of monopoly rent and diminishing returns and of the development of the price structure of natural resources concludes that oil price is determined primarily by price policies of producers and users motivated by power politics, not by purely price-theoretical criteria. Although diminishing land return during the rest of this century is possible, it appears that natural resource prices will be determined less by input than by scarcity, and by efforts to attain the highest ground (monopoly) rent. Oil is the most important current mining product, and energy may in the near future be the main barrier to economic growth. Multinational companies have generally kept the price of oil below its relative use value in the past, which created a favorable production structure for developed countries and contributed to the financing of industrialization. The price policy was supported by a budgetary policy comprising two major elements: (1) the tariff system in which natural resources are duty-free and tariffs increase with degree of processing; and (2) the consumer price system, in which a part of the ground rent of natural resources is charged at the consumption goods stage, and not at the exploitation stage. Analysis of world market price conditions suggests an increasing trade war since the oil price explosion of 1973, and a solution within the framework of the free market mechanism does not seem likely. (Lynch-Wisconsin)

OPTIMAL AND COMPETITIVE USE OF REPLENISHABLE NATURAL RESOURCES BY OPEN ECONOMIES.
Guelph Univ. (Ontario).
J. J. McRae.
Journal of International Economics, Vol. 8, No. 1, p 29-54, 1978. 5 fig, 22 ref, 1 append.

Descriptors: *Economics, *Optimization, *Competition, *Resource allocation, *Renewable resources, *Export, International trade, Welfare(Economics), Consumption, Pontryagin maximum principle, Equilibrium, Decision making, Planning, Production, Natural resources, Model studies, Mathematical models.

Intertemporal and consumption paths of an open economy which exports a replenishable, natural resource-intensive commodity in exchange for a manufactured good are investigated. Along the socially optimal intertemporal consumption path to steady state equilibrium, domestic consumption of resource product will increase if net positive investment in the resource stock is taking place; it will decrease if disinvestment is occurring. With the absence of required markets, the competitive economy will not correctly price the natural resource base. Both the mathematical general equilibrium analysis and the geometric analysis in output space shows that stability of the stationary state depends upon the relationship of marginal technological productivity of the resource base to its marginal biological productivity. In general, optimal steady state equilibrium can occur with any resource mass level; policies which advocate maximum sustained yield are thus not necessarily optimal. A competitive economy myopically groping toward an unknown equilibrium through a series of one-period movements will always, in steady state, produce too little resource product and overproduce the import competing good, or quite possibly underproduce both commodities relative to the optimal steady state point. The market can be forced to behave in an optimal fashion by correctly assigning a user charge on the resource stock, and, if possible, an export tax to obtain the most favorable terms of trade. (Lynch-Wisconsin)

DYNAMIC ANALYSIS OF COMMERCIAL FISHING MODEL,
National Chiao-Tung Univ., Taipei (Taiwan). Dept. of Management.
A. Wang, and K. Cheng
Journal of Environmental Economics and Management, Vol. 5, No. 2, p 113-127, 1978. 23 fig, 1 tab, 12 ref.

Descriptors: *Dynamic models, *Mathematical models, *Mathematical models, *Renewable resources, *Commercial fishing, *Fisheries, *Equations, Commercial fish, Fishing, Model studies, Quadratic models, Capital, Investment, Economics.

A dynamic, quadratic commercial fishing model is investigated, and results imply that fishing capital investment is nonexplosive, fishery resources are nonextinctive, and the solution of the bionomic system is globally stable within an invariant region. This paper continues the discussion of a quadratic commercial fishing model begun by Smith, and by Leung and Wang. Smith proposed the quadratic differential equation predator-prey (fishing industry-fish) model, and connected economic and ecological factors more efficiently. The present model is restricted to non-time lag investment decision and to the simplest biological equation. The bulk of this paper is devoted to detailed derivations. (Lynch-Wisconsin)

URBAN WATER: ACCESS, DELIVERY AND INSTITUTIONAL SCARCITY,
A. Rew.
Sussex University, Institute of Development Studies. IDS Discussion Paper No. 113, 1977. 27 p, 22 ref.

Descriptors: *Scarcity, *Water supply, *Domestic water, *Public access, *Manila(Philippines), *Institutional constraints, *Water allocation(Policy), Equity, Planning, Municipal water, Water delivery, Equitable apportionment, *Philippines, Political constraints, Economics, Urbanization, Costs, Potable water, Water management(Applied), Water demand, Water rights, Water law, Water policy, Water shortage.

Chronic failure to provide domestic water to a significant part of the population of Manila, capital city of the Philippines, is primarily due to institutional considerations rather than to resource scarcity. It is contended that water shortage problems in many if not all countries are due to similar factors. In Manila the immediate problem is caused by the organizational character of the administrative agencies responsible for allocating water. Only those urban groups and individuals with political power succeed in obtaining access to water; the urban poor are excluded with political power succeed in obtaining access to water; the urban poor are excluded from safe and inexpensive water delivery, and urban water systems continue to grow at the expense of rural areas. A possible policy solution is socialization of water resources, or a system more firmly based on ranked beneficial uses of ground and surface water, giving top priority to municipal or community demands for domestic and essential industrial uses. A composite case study is used to demonstrate the problems of access to water in Manila. In many cases, leaks in the distribution system and use of booster pumps contribute to acute water shortages. In 1969 nearly two-thirds of the Manila water supply brought no economic return to the system because over 50% was unmetered and 30% of billings were not collected. The problems are further compounded by accounting confusion and nonfunctional meters. (Lynch-Wisconsin)

A NOTE ON THE WELFARE-ECONOMIC CONSEQUENCES OF EXTENDED FISHING LIMITS,
Bergen Univ. (Norway). Inst. of Economics.
R. Hannesson.
Journal of Environmental Economics and Management, Vol. 5, No. 2, p 187-197, 1978. 2 fig, 5 ref.

Descriptors: *Welfare(Economics), *Economics, *Fishing limits, *Exclusive economic zone, *Law of the Sea, *Commercial fishing, *International law, *International waters, Mathematical models, Models studies, Fisheries, Fish, Prices, Common property, Discount rates, Continental shelf, Fish management, Property rights, Economic efficiency, Fishing, Oceans.

Use of standard two-country two-commodity model to study effects of extending coastal fishing limits shows that the long-term catch will be greater despite seriously overexploited fish stocks; but falling fish prices mean that some if not all of the gains from more efficient fishing will be transferred to consumers in the rest of the world. A United Nations conference is currently considering proposed changes in the Law of the Sea, including the Exclusive Economic Zone, which would give exclusive rights to coastal states over fish and other marine resources in an expanded adjacent sea area. It should not be assumed that the habitat of each fish stock is entirely contained within the fishing limits of the coastal state or that each government will manage the fishery efficiently. In regard to habitat, extended fishing limits would establish joint property rights to fish stocks, and a well-defined group of countries could choose to jointly manage those stocks. As for fishery management, there will be less total gain in efficiency from exclusive fishing rights (none in the limiting case), with coastal countries simply expanding their fishing effort to replace the effort of excluded countries. The basic conclusion is that gains and losses due to exclusive fishing rights are uncertain and vary with each case. (Lynch-Wisconsin)

Descriptors: *Economic impact, *Renewable resources, *Fisheries, *Fishing limits, *Exclusive economic zone, *Welfare(Economics), *International law, *International waters, Economics, Law of the Sea, Policy, Optimization, Commercial fishing, Model studies, Mathematical models, Oceans, Two-hundred mile zone.

Effects of a proposed 200-mile seabed zone under consideration by the United Nations Law of the Sea Conference are evaluated for a hypothetical completely independent resource stock (such as fish) in the form of separate 200-mile zones. The analysis modifies the framework developed by Markusen (1976) in a study of two countries sharing a common resource stock. The present analysis suggests that taxing foreign fishermen in domestic waters is better than excluding them, except when the resource good is an import good. An implicit assumption is that the foreign country is entirely passive, and therefore this policy recommendation should be regarded as a set of optimal policies at a certain historic stage. At each fairly long historic stage, every country optimizes its national welfare given the conditions of the previous stage. At the initial stage factory fleets are built as a result of protein shortage and the protected fishing industry of a few industrial nations, which overfish the oceans and move into fishing grounds of less industrial coastal stages, causing external diseconomies to the local fishing industry. In the second stage coastal states respond by claiming 200-mile economic zones and by implementing various optimal policies. In a future third stage industrial nations may retailiate. THE IDAHO AND MONTANA PROCEDURES FOR OBTAINING WATER USE PERMITS--POSSIBLE SOURCES FOR IMPROVEMENT OF WYOMING LAW, COMMENTS,
Wyoming Univ., Laramie. Coll. of Law.
W. D. Hickey.
Land and Water Law Review, Vol. X, No. 2, p 435-454, 1975. OWRT A-003-WYO(1), 14-31-0001-5051.

Descriptors: *Water law, Idaho, Montana, *Wyoming, Water rights, *Water permits, Water allocation, Legislation, Prior appropriation.

In 1974 the Idaho and Montana legislatures adopted mandatory permit systems for the initiation of water rights in those states. A critical analysis of each statutory scheme is presented and each is compared with existing Wyoming water law. The benefits and disadvantages of each system are weighed in a discussion of six provisions present in one or two of the three statutory schemes. These provisions include such matters as notice and hearing requirements; grounds, including public interest, for issuing or refusing a permit; conditional permits; time limits within which the responsible state agency must act on the permit application, and within which the applicant must perfect the water right; and final proof of the appropriation. Some possible additions to and improvements of existing Wyoming water law are suggested. Nevertheless, it is concluded that the Wyoming procedure provides for efficient administration of the state's water.

CHANGING MANNER AND PLACE OF USE OF WATER RIGHTS IN WYOMING, COMMENTS,
Wyoming Univ., Laramie. Coll. of Law.
D. B. Riggs.
Land and Water Law Review, Vol X, No 2, p 455-476, 1975. OWRT A-003-WYO(2). 14-31-0001-5051.

Descriptors: *Water law, *Wyoming, *Water rights, *Legislation, Diversion, Prior appropriation.

The Wyoming Legislature in 1973 and 1974 altered significantly the method by which Wyoming water users may change the use or place of use of their water rights, as well as the substantive rights of such users to effect changes. These legislative developments are examined against the backdrop of the then existing law and analyzed for potential problems which may arise in their application. The Wyoming Legislature in 1909 enacted the original 'no change' statute. This statute severely curtailed the application of the more liberal common rule which allowed changes in the point of diversion, place of use, and of the use itself, so long as rights of others were not impaired. In the interim, however, the basic statutory 'no change' provision became swallowed by exceptons. While the 1973 and 1974 enactments did not expressly repeal the original 'no change' provision, they at least significantly altered procedures for making changes and, arguably, repealed the provision. Procedures dictated by the new provisions are described. Problems may arise when there are: changes from nonconsumptive to consumptive uses; changes involving the nature of required flow; changes affecting seepage and evaporation; and changes resulting in various types of injuries to other users. Notwithstanding the problems which may arise in the application of the new statutes, a cautious stamp of approval is given to the 1973 and 1974 legislative developments.

PROCEDURAL INCONSISTENCIES AND SUBSTANTIVE ISSUES IN THE FEDERAL RESERVED WATER RIGHTS DOCTRINE. CASE NOTE, UNITED STATES V. AKIN, 504 F.2D 115 (10TH CIR. 1974),
Wyoming Univ., Laramie. Coll. of Law.
J. O. Beppler.
Land and Water Law Review, Vol. X, No. 2, p 477-487, 1975. OWRT A-003-WYO(3), 14-31-0001-5051.

Descriptors: *Water law, *Water rights, Colorado, Wyoming, *Reservation doctrine, *Federal-State water rights conflicts, Legislation, Prior appropriation.

The federal reserved water rights doctrine and some of the procedural and substantive problems which have arisen from its application, are discussed. The Note centers on the dual federal-state system for adjudicating such rights which presently exists in Colorado, and the potential for future inconsistencies in administering federal water rights in states like Wyoming. The procedural duality, resulting from the Akin decision, is unacceptable; federal legislative efforts are necessary in this area. Some flaws existing in proposed federal legislation are described with special examination given to the bill presently offered by the Department of Justice, Land and Natural Resources Division. In relation to substantive areas, the need for quantification of federal reserved water rights, as well as protection for present users of such rights, is indicated.

Descriptors: *Water law, Groundwater, *Water rights, *California, *Correlative rights doctrine, Prior appropriation, Jurisdiction.

In this case the California Court of Appeals imposed a 'public servitude' on a user of the overlying land in a groundwater basin. The Court then used this 'public servitude' to deny the user inverse condemnation for the flooding of his gravel pits. This Note explores the doctrine of correlative rights as it affects the use of land and water. In addition it discusses alternative methods to reach the result the Court in this case did in both a correlative rights jurisdiction and in prior appropriation jurisdictions.

AN EXAMINATION OF LEGISLATION FOR THE PROTECTION OF THE WETLANDS OF THE ATLANTIC AND GULF COAST STATES,
Mississippi Univ., University. School of Law.
A. J. Haueisen.
Gulf Research Reports, Vol. 4, No. 2, p 233-263, November, 1973.

Descriptors: *Legislation, *Wetlands, *Protection, Legal aspects, Atlantic coastal plain, Gulf coastal plain, Preservation, Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas.

Wetlands are defined and the basic ecology of wetlands of this region discussed briefly. Federal laws and the laws of the coastal states are examined to determine what they have done to preserve and utilize these wetlands. A general categorization of the legal approaches various states have taken indicates the following: (1) legislation which enables a state to acquire wetlands or any easement, interest or rights, therein, (2) legislation which prohibits certain activities in wetland areas, (3) the Long Island (NY) Wetlands Act is unique in providing that the State may enter into cooperative agreements with counties to maintain wetlands and may furnish one-half of the cost of maintenance, and (4) legislation not directly related to wetlands but affecting flood plains. A legislation model for a wetlands act is provided and possible implementation of this proposed legislation discussed. (Stihler-Mass)

THE CONTROVERSY CONTINUES: STATE OWNERSHIP OF DRILL RIGS,
Indiana State Board of Health, Indianapolis
J. M. King.
Water Well Journal, Vol. 30, No. 12, p 63, December, 1978.

Descriptors: *Drilling, *State governments, *Monitoring, Water wells, Water quality, Groundwater.

The advantages of state ownership of drilling rigs are presented. Such ownership is the result of efforts to more effectively implement Federal legislation aimed at water resources protection, an obvious long-term benefit the water well industry. Without their own equipment state agencies must endure the paper work and delay that is usually involved in contracting with a private drilling firm. A significant amount of detailed and critical subsurface information is required where the wells are to be used for enforcement activities. Many water well drillers are neither trained nor equipped to conduct may of the types of logging, sampling and testing needed by regulatory agencies. Government involvement in well construction is limited mainly to water quality surveillance associated with specific enforcement cases and to the installation of scientific data-gathering devices. By actively engaging in preserving ground water quality the government is helping to secure the future of the water well industry. (Purdin-NWWA)

THE NEED FOR PROFESSIONALISM AND ITS ATTRIBUTES IN HYDROGEOLOGY,
R. J. Henning, and J. R. J. Studlick.
Ground Water, Vol. 16, No. 6, p 451-452, November-December, 1978.

Descriptors: *Professional personnel, Hydrogeology, *Employment, *Training, Organizations, Salaries.

Hydrogeology should be considered a profession comparable to engineering and medicine. To be a professional requires proper training, organization and recognition. The training of a hydrogeologist involves interdisciplinary studies and practical experience. The organizational requirement is met by NWWA. Recognition is the most difficult professional attribute to attain because it is subjective. This can be helped by requiring certification of hydrogeologists. Public acceptance and faith in hydrogeology can be gained by publishing more reports on ground water that are concise, clearly written, free of technical jargon, and available to the public at little or no cost. Attendance at professional meetings provides an opportunity to learn a great deal and improve professional confidence. Salaries for hydrogeologists should be on a part with that of engineers and geologists. The NWWA will survey, compile, and make available the facts of employment in the profession. More input is needed from professionals in the form of articles, suggestions and comments. (Purdin-NWWA)

Southern Journal of Agricultural Economics p 1-7, December 1975. 4 tab, 9 ref. OWRT B-043-MASS(6), 14-31-0001-5081.

Descriptors: *Floodplain management, Decision framework, *Non-structural alternatives, Methodology, *Regional analysis.

The objectives were: (1) to develop a methodology useful to planners at several levels for efficient floodplain management, considering both structural and non-structural measures, and (2) to demonstrate the usefulness of the methodology by applying it to selected floodplain (Farmington, Connecticut) in the Connecticut River Basin. The framework that is developed could provide information for improved decisions, and its applicability is demonstrated. In some regional situations, the variables designated as controls were not controllable under current institutional arrangements. In these cases, solutions can provide implications associated with the maintenance or alteration of these institutional structures.

6G. Ecologic Impact Of Water Development

QUANTIFICATION, DECISION-MAKING AND ENVIRONMENTAL IMPACT ASSESSMENT IN THE UNITED KINGDOM.
Aberdeen Univ. (Scotland). Dept. of Geography.
R. Bisset.
Journal of Environmental Management, Vol. 7, No. 1, p 43-58, July, 1978. 3 fig, 2 tab, 31 ref.

Descriptors: *United Kingdom, *Environmental effects, *Decision making, *Planning, *Methodology, *Analytical techniques, Governments, *Environmental Evaluation System, Quantitative matrix system(Sphere), Land use, Cost-benefit analysis, Quantification, Economic development, Economics, Social values, *Evaluation.

Two methods of quantifying and aggregating environmental impacts for evaluating large-scale development projects or governmental policies are analyzed, and both are rejected because they tend to mask contentious issues, and can be used to control debate on the merit of proposals. The methods assessed are: (1) the Environmental Evaluation System (EES) developed for the U.S. Bureau of Land Reclamation, and (2) a quantified matrix developed by Sphere Consultants and used to rank sites for oil production platforms in Scotland. EES is based on a hierarchical checklist of 78 environmental parameters, each of which can be represented numerically. The parameters, each of which can be represented numerically. The parameters are assigned individual weights so that they can be compared and summed. The quantified matrix system, although fully quantified, is crude in comparison with EES. In the matrix, sites are listed horizontally (columns), while factors such as visual intrusion, reinstatement possibility, and land use destruction are listed vertically (rows). Construction impact at each site on all factors is shown by a subjectively derived number (0-5); factors all have equal weight. Ranking is achieved by simply summing columns. Subjective and unsophisticated weightings are then used to test the sensitivity of the ranking. While impact quantification is promoted as a means of countering economic arguments of developers, it is concluded that open discussion of impacts would not be aided by these methods, and their use in the United Kingdom should be opposed. NATURAL RESOURCES AND ENVIRONMENTAL RESTRICTIONS TO GROWTH,
Harvard Univ., Cambridge, MA.
E. Mason.
Challenge, Vol. 20, No. 6, p 14-19, January-February 1978.

Descriptors: *Natural resources *Scarcity, *Pollution abatement, *Costs, *Regulation, *Industrial production, History, Raw materials, Environment, Energy, Welfare(Economics), Economics, Public benefits, Political constraints, Developing countries, Externalities, Gross national product, Paley Commission

Economic costs and theoretical implications of environmental protection are assessed, and changing attitudes toward use of natural resources are traced. German efforts during World War II to boost military equipment production through substitution, redesign of equipment, collection of scrap, and paring of civilian requirements are used as an example of how metals shortages can be overcome. The Paley Commission Report of 1952 on U.S. national materials policy is also reviewed along with the issue of current materials scarcities and economic growth and the environment. The Paley Commission report concluded that the constraint to economic growth would not be physical limits of discoverable supplies, but rather the real costs of making those supplies available. The report said nothing about the desirability of protecting the environment, and therefore nothing about what such protection would cost. A United Nations study estimated that countries with per capita incomes above $2000 would have to spend 1.4-1.9% of GNP to attain U.S. air, water, and waste disposal standards. The U.S. spent 1.6% of GNP in 1974. Kneese estimates that with expenditures of 5% the GNP until the end of the century developing countries would greatly reduce residuals discharged to the environment, but 2.0-2.5% would seem more realistic; such a rate would mean a reduction in consumption of some goods and services. The world is not facing scarcities of industrial materials, nor even rising costs of such materials in the next century. (Lynch-Wisconsin)

ENVIRONMENTAL IMPACT ASSESSMENT: AN AQUATIC BIOLOGIST'S POINT OF VIEW,
Ohio State Univ., Put-in-Bay. Center for Lake Erie Area Research.
C. E. Herdendorf.
Ohio Journal of Science, Vol. 78, No. 4, p 229-234, July 1978. 1 fig, 1 tab.

Descriptors: *Environmental effects, *Evaluation, *Water pollution effects, *Dredging, *Maumee River(OH), *Maumee Bay(OH), Water management(Applied), Scour, Benthos, Plankton, Bays, Rivers, Lakes, Great Lakes, Ohio, Lake Erie, Ecology, Ecosystems, Gravels, Sands, Methodology, Estuaries, Monitoring, Baseline studies, Sediments, Dissolved oxygen, Fish.

Evaluation of effects of sand and gravel dredging in the Maumee River estuary (Ohio) and Maumee Bay of Lake Erie exemplifies an environmental impact assessment which considers ecological factors. The assessment concludes that the overall impact of dredging activities in the aquatic ecosystem is minor, and the river/bay ecosystem would not be distinctly different in the absence of dredging. Prior to dredging initiation in April 1975 an extensive series of water quality and biological monitoring samples were collected at several sites and analyzed. Continued sand and gravel production would economically benefit the Toledo metropolitan area. Short-term negative effects include: (1) limited hydraulic and water quality impact, (2) minor noise and visual impact, and (3) reduction of benthic and planktonic life forms. Long-term adverse effects would be slight. Dredging would increase both river and bay depths and reduce river velocity, particularly during high runoff and floods, causing sedimentation of silt in excavations. In the bay, waves would break closer to shore, with increased scour 300-600 m from shore. Turbidity would temporarily increase, reducing light

penetration and depth of photosynthetic activity by phytoplankton. Planktonic organisms, including larval fish would be lost if entrained in dredge service water, and benthic forms would be eliminated at dredge sites. (Lynch-Wisconsin)

ECOLOGICAL EFFECTS OF HIGHWAY CONSTRUCTION UPON MICHIGAN WOODLOTS AND WETLANDS: SOIL RELATIONSHIPS,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Science.
J. L. McLeese, and E. P. Whiteside.
Journal of Environmental Quality, Vol 6, No 4, p 467-471, 1977. 2 fig, 4 tab, 9 ref.

Descriptors: *Wetlands, *Michigan, *Highway effects, *Drainage effects, Forests, Highways, Soil, Drainage, Soil erosion, Soil management, Hydrology.

Ecological effects of recent highway construction on soils, hydrology, vegetation, and wildlife have been cooperatively evaluated for some common woodland and wetland types in central lower Michigan. A soil inventory was prepared for each area and the highway's impact on the soils was determined. The most significant effects of highway construction on the soil environment were the erosion of soil materials and the alteration of natural soil drainage conditions. Wetland areas are most sensitive to highway construction activities. Natural soil drainage conditions and circulation patterns are easily disrupted at these sites. Methods for predicting potential soil loss and potential changes in natural soil drainage conditions due to highway construction activities are suggested. A soil map of each proposed highway corridor or alternative right-of-way should be available early in planning of proposed highway construction. The soil map can be useful in predicting construction impact on the associated hydrology, plants, and animals in the area. These, in turn, are basic information in evaluating the economic and social impacts of the proposed route on the communities involved. (Steiner-Mass)

TELEMETRIC DETERMINATION OF SALMONID WINTER MICRO-HABITAT OCCUPATION AND MOVEMENT IN ICE-COVERED STREAMS,
Wyoming Univ., Laramie.
D. L. Wichers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 701, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, July 1978. 110 p, 19 fig, 9 tab, 58 ref, 3 append. OWRT B-038-WYO(1), 14-34-0001-8130.

Descriptors: *Salmonids, *Aquatic habitats, *Overwintering sites, Brown trout, Ice cover, *Wyoming, Streams, *Instream flow(Winter), Telemetry, *Tracking techniques, *Winter habitats(Trout).

In order to recommend suitable winter instream flows for Wyoming's medium-sized brown trout streams, research was conducted during the fall and winter season, 1977-1978, to determine winter microhabitat occupation preferences and movements of adult brown trout in a totally ice-covered Rocky Mountain stream. Surgically implanted radio transmitters were used for identifying pre-ice resting and feeding locations and resting, feeding, and cover locations during ice-cover. Parameters identified were water depth, mean velocity, point velocity, substrate type, cover type, and ice thickness, when present. Winter microhabitat preferences indicated that brown trout preferred shallower water depths with low mean velocities, under overhead ice-cover. Winter movement data indicated that brown trout have a period of increased activity, usually upstream, after initial ice-cover. Fish appeared to move to more preferred focal areas for over-wintering.

FULL-SEASON RAIN GAUGE HAVING REPLACEABLE CHARTS FOR MAKING PROFILE GRAPHS,
C. F. Marley.
U.S. Patent No. 4,106,336, 3 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1009, August 15, 1978.

Descriptors: *Patents, *Rain gages, *Instrumentation, Rainfall, Charts, Weather data, Accumulated rainfall.

A full-season rain gauge for outdoor or partial outdoor installation comprises basically a weather-resistant vertically elongated panel, a season-height freeze-proof plastic tube, a shorter single-rain short-time-period plastic rain-gauge tube detachably mounted on the upper end of the season-height tube, and a one-season weather resistant chart for recording accumulated dated rainfall amounts and for subsequent side-by-side positioning to provide a successive-seasons profile graph. The shorter tube is removable after each rainfall or e.g. at weekly intervals. Its contents are then poured into the season-height tube, and the water height is marked and dated on the chart. The rain collector can be mounted at an elevated outdoor locations and can be connected indoors to the rain gauge proper by a small flexible hose. (Sinha-OEIS)

REMOTE SENSING TECHNIQUES AND THE MONITORING OF DESERTIFICATION PROCESSES IN ARID AREAS,
Desert Inst. Ashkhabad (USSR).
N. G. Kharin.
In: Man and the Biosphere, Soviet Committee for the UNESCO Program, p 3-31, 1977. 5 tab, 7 fig

Descriptors: *Remote sensing, *Monitoring, *Aerial photography, *Desertification, Analytical techniques, Surveys, Terrain analysis, Climatolo-

gy, USSR, Radar, Hydrogeology, Geomorphology, *Turkmen SSR.

When studying the desertification of an area, it is necessary to identify manifestations of all forms of desertification, such as climatic processes (i.e. increases of aridity, reduction of water reserves caused by changes in the macro- and microclimates), hydrogeological processes (i.e. atmospheric precipitation becomes more scarce and the supply of groundwater episodic), morphodynamic processes (i.e. some geomorphological processes become more active including wind erosion of salts, water and wind erosion, transformation of fixed sands into moving sands, etc.), soil processes, phytogenetic processes, and zoogenetic processes, and global scale is discussed and illustrated here. Forming the basis of this analysis are the general principles governing the scale of photography, types of carrier, photographic zones, and methods of photography. Other types of aerial surveys, in particular radar and thermal, are discussed as well To illustrate these principles, the use of various techniques in the study of the desertification in the arid territories of Turkmenistan are described. POTENTIAL FOR DOWNWARD LEAKAGE TO THE FLORIDAN AQUIFER, GREEN SWAMP AREA, CENTRAL FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. F. Grubb.
Water-Resources Investigations 77-71 (open-file report), 1978. 1 sheet, 6 fig, 1 tab, 10 ref.

Descriptors: *Groundwater recharge, *Leakage, *Sand aquifers, *Confined water, *Aquifers, *Maps, Aquicludes, Permeability, Porous media, Natural recharge, Geohydrologic units, Core drilling, Sampling, Mapping, Florida, *Floridan aquifers, *Green Swamp area(Fla)

A qualitative evaluation of the potential for downward leakage from the surficial sand aquifer to the underlying Floridan aquifer was made for the Green Swamp area (about 870 sq mi) in central Florida. Downward leakage, or recharge, is limited under natural conditions owing to the nearness to land surface of the potentiometric surface of both the sand aquifer and the underlying Floridan aquifer. Continuous cores of the unconsolidated section were obtained at 74 sites in the study area and were evaluated for downward leakage potential based on grain-size distribution. Sand percentage was estimated for each interval or bed from microscopic examination of the core samples. The four maps prepared from this data show sand thickness, clay thickness, relative vertical hydraulic conductivity of the confining beds and the relative potential for downward leakage. About 20 percent (178 sq mi) of the area classified has a relatively good potential for downward leakage; almost 50 percent of the area has a relatively poor potential. (Woodard-USGS)

WATER RESOURCES DATA FOR WASHINGTON, WATER YEAR 1977--VOLUME 1. WESTERN WASHINGTON.
Geological Survey, Tacoma, WA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 611, Price codes: A19 in paper copy, A01 in microfiche. Water-Data Report WA-77-1, July 1978. 433 p, 22 fig.

Descriptors: *Washington, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Western Washington

Water resources data for the 1977 water year for Washington, consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells and springs. This report, in two volumes (western and eastern), contains discharge records for 258 gaging stations; stage only records for 4 gaging stations; stage and contents for 44 lakes and reservoirs; water quality for 162 stations and 7 lakes; and water levels for 173 observation wells. Also included are 146 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Washington. (See also W79-02139) (Woodard-USGS)

TWO DRILLING METHODS COMPARED,
Schultes (A. C.) and Sons, Inc., Woodbury, NJ.
J. F. Schultes, Sr.
The Johnson Drillers Journal, p 2-4, September-October, 1978. 4 fig.

Descriptors: *Drilling, *Water wells, Rotary drilling, Reverse circulation drilling, Specific capacity, Well efficiency, Drawdown, Aquifer tests, *Maryland, *Piney Point aquifer(MD).

Two drilling methods were employed for two wells in the Piney Point aquifer in Maryland which is a non-uniform sand aquifer. The first well was drilled using the mud rotary method. After development its specific capacity was 94 gpm per foot of drawdown which indicates a well efficiency of only 38.3 percent. The second well was drilled using the reverse circulation method and the diameter was increased from 18 to 24 inches. A controlled 24 hour pumping test resulted in a specific capacity of 16.6 gpm per foot of drawdown which indicates that the well efficiency of only 38.3 percent. The second well was drilled using the reverse circulation method and the diameter was increased from 18 to 24 inches. A controlled 24 hour pumping tests resulted in a specific capacity of 16.6 gpm per foot of drawdown which indicates that the well attained an efficiency of almost 100 percent. It was concluded that the reverse circulation drilling method was responsible for the higher efficiency of the second well because it cleans the fine particles of sand from the wall of the hole. DISASTER RESPONSE TO FLASH FLOOD,
Federal Water Pollution Control Administration, Denver, CO. South Platte River Basin Project.
R. L. Berling.
Journal of the Water Resources Planning and Management Division, American Society of Civil Engineers, Vol. 104, No. WR1, Proceedings Paper 14111, p 35-44, November 1978. 9 fig.

Descriptors: *Flash floods, *Colorado, *Disasters, Diversion, Flood control, Rain, Flood data, Floods, Precipitation(Atmospheric), Rainfall, Projects, Storms, *Rocky Mountain National Park, *Emergencies, *Big Thompson River Canyon, Diversion works, Emergency reporting systems.

Extremely heavy rainfall occurred in the Big Thompson River Canyon of Colorado on July 31, 1976. The severe flash flood, which developed in a few hours, claimed 145 lives and caused nearly $40,000,000 in property damage. Several features of the Colorado-Big Thompson water diversion project, located on the river system, played an important role in preventing even greater damage and loss of life. The project operational alert to the disaster came from the personal observation of heavy rainfall and measurement of flood flow in the Estes Park area. Based upon the observed conditions and best judgement, immediate action was taken to place the project system into an emergency mode of operation. A broad-scale program of restoration of water and power facilities was initiated on August 1. A critique of the operation provided first hand experience that could be of value to other water resource managers. (Roberts-ISWS)

PRACTICAL RIPRAP DESIGN,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
S. T. Maynord.
Miscellaneous Paper H-78-7, June 1978. 74 p, 24 fig, 10 tab, 2 pl, 14 ref.

Descriptors: *Riprap, *Design, *Design criteria, *Sheer stress, *Shield's design, Engineering structures, Bank stabilization.

Determination of stable riprap size is a problem that has been studied extensively but not yet solved. Existing design methods are based the shear stress exerted by the flowing water on the channel boundaries. The various methods available for computing the shear stress do not agree. Determination of the amount of shear stress a given size riprap can withstand depends upon which investigator's coefficient is used in the Shields' equation. The objective of this investigation was to develop a riprap design procedure based on known or easily calculated variables that properly describes ripra stability. Model tests of riprap stasbility were used in this investigation to insure that the proposed design procedure is applicable to the higher turbulence levels found in decelerating flow in open channels. Design curves for bottom riprap and side slope riprap in straight channels are presented. Tentative criteria for riprap in channel bends are discussed. (WES).

BAY SPRINGS CANAL SURGE STUDY, TENNESSEE-TOMBIGBEE WATERWAY, MISSISSIPPI AND ALABAMA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. H. Tate, Jr.
Technical Report H-78-9, June 1978. 26 p, 7 pl.

Descriptors: Model studies, *Locks, *Surges, *Tennessee-Tombigbee Waterway(Ala-Miss), Hydraulic models, *Bay Springs Canal(Miss), Mississippi, Alabama.

A 1:80-sale hydraulic model was used to study flow conditions in the canal downstream of the proposed Bay Springs Lock. The original design ad plan of operation caused severe conditions in the canal and required modification of the lock discharge system ad lower approach geometry. Based on the results of this study, the design 2 diffuser and lower approach with a 2-min emptying valve schedurle should provide satisfactory navigation conditions downstream of the project. This design is expected to produce a relatively slow upwelling of the water surface in the lower approach with a maximum height of 2.5 ft and to exert a force of less than 36 tons on a tow similar to that used in the study. PHYSICAL MODEL SIMULATION OF THE HYDRAULICS OF MASONBORO INLET, NORTH CAROLINA,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
R. A. Sager, and W. C. Seabergh.
General Investigation of Tidal Inlets (GITI) Report 15, November 1977. Conducted jointly with U.S. Army Coastal Engineering Research Center, Fort Belvoir, Virginia. 552 p, 5 tab, 105 photos, 349 pl, 9 ref.

Descriptors: *Hydraulic similitude, *Hydraulic models, Model studies, *Masonboro Inlet(NC), Fixed-bed models, *Simulation analysis.

Masonboro Inlet was selected as an inlet to determine the usefulness and reliability of physical and mathematical models in predicting hydraulic characteristics of inlet/bay systems. Results obtained from the physical model study are presented. Masonboro Inlet fixed-bed model, constructed to scales of 1:300 horizontally and 1:60 vertically, reproduced an area extending to the -45 ft contour in the Atlantic Ocean and to the nodal points in each interior channel. After model verification tests proved satisfactory, a detailed examination of the effects of waves on model current and tidal height data was made. After testing the 1969 condition, the model was remolded to the November 1964 condition, which represents a time preceding the construction of improvements--a north jetty, a deposition basin, and a dredged channel. Base data were collected, then the improvements were installed upon this condition and tests were run to predict the effect of the improvements on tidal elevations, tidal currents, and wave-induced currents. Fixed-bed model predictions of filling of the dredged navigation channel, filling of the deposition basin, and a tendency for the navigation channel to shift toward the north jetty were substantiated by comparison with the 1966 model results and with prototype data. SHOALING CONDITIONS IN SAWYER BEND AND LOWER ENTRANCE TO CHAIN OF ROCKS CANAL, MISSISSIPPI RIVER; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. E. Foster, C. M. Noble, and J. J. Franco.
Technical Report H-78-7, June 1978. 68 p, 24 pl, 11 fig.

Descriptors: *Channel improvement, *Sediment transport, *Mississippi River, *Hydraulic models, *Shoaling, *Moveable-bed models, *Sawyer Bend(Mo-Ill), *Chain of Rocks Canal(Mo-Ill), Missouri, Illinois.

Investigates the development of an adequate channel and access to the docking facilities along the right bank in Sawyer Bend and the reduction or elimination of shoaling in the lower entrance to the Chain of Rocks Canal. Shoaling in the lower entrance to the canal during low flows has created a serious problem because of the amount of dredging required and the lack of suitable disposal areas. The purpose of the model study was to develop plans that would provide a satisfactory channel in Sawyer Bend and reduce or eliminate the need for dredging in the lower entrance and approach to the Chain of Rocks Canal. A movable-bed model, constructed to scales of 1:250 horizontally and 1:100 vertically, reproduced the Mississippi River and adjacent overbank areas between miles 191.0 and 180.5. Results indicate development of a satisfactory channel in Sawyer Bend can be accomplished by reducing the amount of flow through the chute channel to the left of Mosenthien Island and forcing the channel to cross toward the right band farther upstream. This could be accomplished with the plan developed on the model and at the same time maintain some flow in the chute channel during all river stages. (WES)

THE WATER SUPPLY SYSTEM OF CAESAREA MARITIMA,
Y. Olami, and Y. Peleg.
Israeli Exploration Journal, Vol. 27, No. 2-3, p 127-137, 1977. 7 fig, 27 ref.

Descriptors: *Aqueducts, *Paleohydrology, *Hydraulic design, *Structural analysis, *History, Archaeology, Water resources development, Structural design, Construction, Adaptation, Conveyance structures, Dams, Dating, Israel, Water control, Diversion structures.

The water supply system of ancient Caesarea, first described by the Palestine Exploration Fund Survey in the 1870's, is analyzed here. The system is comprised of two distinct water lines, high level and low level aqueducts. The first was fed by two sources, the Shumi springs near the old Roman theater at Miyamis, north of Binyamina, and the springs of the Ammiqam-Avi'el area about 7.5 km northeast of Miyamis. This double-structured aqueduct actually is comprised of two aqueducts joined laterally to accommodate two parallel channels. The low level dam starting at Nahal Tanninim dam near Ma'agan Mikhael is designed to exploit the hundreds of springs from 3.5 to 4m above sea level to the height of at least 5.5 m required to deliver the water to Caesarea. Examination of the entire system reveals evidence of various phases of construction, modification, and repair. The eastern and most ancient part of the system was constructed during Herodian times, followed shortly thereafter by the construction of the western aqueduct, perhaps during the time of Hadrian. The exact dating and chronology for the construction of the component parts of the system are subjects of speculation and argued here. Caesarea and its water supply system was conquered and laid waste by the Mameluke Sultan Baybars in A.D. 1265. (Tickes-Arizona)

WATER SYSTEMS BASICS, (1),
E. A. Scott, Jr.
Ground Water Age, Vol. 13, No. 2, p 17-19, October, 1978. 3 fig.

Descriptors: *Water supply, *Water wells, *Pumps, Water sources, Driven wells, Drilled wells, Bored wells, Dug wells, Water pollution, Suction force, Atmospheric pressure, Centrifugal force, Impeller, Shallow wells.

Ground water is preferable to surface water as a source of potable water for private supply systems. It is drawn from wells of various types such as: driven wells, drilled wells, bored wells, and dug wells. Construction techniques and equipment and safety measures against contamination are described for each type of well. Two basic principles involved in pumping of water from wells are: suction force, which is the result of atmospheric pressure, and centrifugal force. Theoretically, suction force could lift water 33.9 feet, but practically, 25 feet is the maximum lift of suction-type pumps. In wells deeper than 25 feet, centrifugal force must be used to bring water to the surface. Centrifugal force underlies the operation of all common water systems pumps--jets, submersible, turbines. In practice, the pump creates centrifugal force with a bladed wheel known as an impeller. Water enters the pump housing and flows outward from the axis. This flow creates a partial vacuum or suction, which brings additional water in through the intake. In simplest form, the intake is connected to the drop pipe into the well. However, this is suitable only for very shallow wells - 15 feet or less. For greater depths a jet pump is commonly used. (See also W79-02181) (Purdin-NWWA)
W79-02180

WATER SYSTEMS BASICS, (2),
A. E. Scott, Jr.
Ground Water Age, Vol. 13, No. 3, p 15-19, November, 1978. 4 fig.

Descriptors: *Jet pumps, *Submersible pumps, *Storage tanks, Water wells, Pumps, Water supply systems, Lightning arresters.

Basic water system pumps and accessories are described in detail. Jet pumps utilize an ejector which draws water continuously through a partial vacuum. They are classified as shallow-well, deep-well, convertible, multi-stage or verticle. Submersible pumps are the fastest growing type. Every submersible has a series of stages arranged on a common shaft. Each stage consists of an impeller and a diffuser. The motor is submerged in the well along with the pump. Submersibles are quiet and ideal for deep wells. Submersible pumps are classified according to diameter, number of electrical cables, and motor design. There are three basic motor types: Hermetically sealed, oil-filled, and non-hermetic waterfilled. Other types of pumps include: piston pumps, working head, and vertical turbine. Pressure tanks store water from the well. Air would waterlog the tank if not controlled by a valve, tank float, or diaphragm. Pressure tanks should be equipped with a pressure switch, pressure gage, relief valve, liquid level control, and foot valve. Wells should be protected from contamination with a well seal or pitless adapter. Lightning arresters protect pump from high voltage surges during thunderstorms. (See also W79-02180) (Purdin-NWWA)

DRIVE DEVICE FOR RAKE ARM WITH ATTACHED SCREEN COMB IN CLEANING DEVICE FOR A WATER CONDUIT SCREEN,
Schrieber GmbH and Co KG, Langenhagen (West Germany). (Assignee).
S. Rudolph, J. Noring, and A. Schreiber.
U.S. Patent No. 4,107,040, 8 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 973, No 3, p 1247, August 15, 1978.

Descriptors: *Patents, *Cleaning, *Screens, *Filters, Conduits, Conveyence structures, Suspended solids, Equipment, Screen rake.

Devices for the cleaning of screens which are located in a water conduit include a screen rake capable of being moved from an intermediate or rest position above the water surface into a meshing position with the screen, and then into a substantially horizontal position above a collecting bin for emptying. The object of the invention is the development of an improved cleaning device where as low a structural height of the device as possible is maintained, and where the rake arm is operated by a simple, trouble-free mechanical control arrangement. The screen rake is mounted and driven by a chain to be guided in a path so that the screen comb cleans the screen, deposits the screenings in a bin and returns to clean the screen again in a continuous and non-interrupted fashion. The path is formed by a number of connected angle bars which are curved in shape and which are placed between a number of chain wheels around which the chain is wrapped for movement.

HYDRAULIC MODEL TESTS OF THE PROPOSED WEIR FOR THE RICHELIEU RIVER AT ST. JEAN, QUEBEC,
Canada Centre for Inland Waters, Burlington (Ontario)
P. Engel, and Y. L. Lau

Unpublished Report, Canada Centre for Inland Waters. March, 1977. 22 p. 12 fig, 3 tab, 2 ref.

Descriptors: *Hydraulic models, *Weirs, *Discharge coefficient, Model studies, Design, Engineering, Hydraulic similitude, Testing, Engineering structures.

A model of a proposed weir for the Richelieu River was constructed and tested to obtain the stage-discharge relationship and to investigate if the control of the tailwater level will affect the discharge coefficient. It was found that the discharge coefficient was not affected for flows lower than about 40,000 cu ft/sec. Two modifications of the weir were tested. Both showed significant reduction in scour of the river bed as compared with the original weir design. A horizontal extension of the weir is the recommended modification. The rip-rap protection was designed and tested and found to be stable for the weir with the recommended extension. (Steiner-Mass)

LIQUEFACTION POTENTIAL OF HYDRAULIC FILLS,
Army Engineer District, Los Angeles, CA.
R. M. Pyke, L. A. Knuppel, and K. L. Lee.
Journal of the Geotechnical Engineering Division, American Society of Civil Engineers, Vol. 104, No. GT11, Proceedings Paper 14133, p 1335-1354, November 1978. 9 fig, 1 tab, 29 ref.

Descriptors: *Landfills, *Seismic design, *Harbors, *California, Earthquakes, Land use, Dikes, Shore protection, Laboratory tests, Density, *Los Angeles(Calif), *Long Beach(Calif), Hydraulic fills, Liquefaction.

The potential for future earthquake-induced liquefaction in the hydraulic fills of this important harbor area was examined with the aid of several recently proposed detailed and simplified procedures. In addition, the validity of these procedures was assessed by applying them in liquefaction analysis of the hydraulic fills existing in the harbor during the 1933 Long Beach Earthquake. The study suggested that there is something less than a 50% chance of liquefaction occurring during the useful lifetime of these facilities. The consequences of liquefaction will depend on the nature of land at the time. (Visocky-ISWS)

CONSTRUCTION AND OPERATION OF LOW-PRESSURE DAMS ON PERMAFROST SOILS,
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 253, Price codes: A03 in paper copy, A01 in microfiche. Draft Translation 625, July 1977. 25 p, 7 fig, 2 tab, 2 ref.

Descriptors: *Cold weather construction, *Dams, *Earth dams, *Permafrost, Soils, Frozen soils, Freezing, Thawing, Infiltration, Cold regions, Structures, Hydraulic structures, Construction, Reservoirs, Reservoir operation, Engineering, Civil engineering, *USSR.

During the construction and operation of frozen dams, frozen soils may be used for the foundation. However, the foundation soils must not be allowed to thaw. Filtration through the body and foundation of a dam should be completely precluded. Otherwise, losses of the filration resistance and overall strength of the facility will occur. The requirement of ensuring against filtration through the body and foundation of a dam and its abutment with the spillway also must be observed during the construction of dams by the thaw method. Filration eventually promotes the formation of a thaw zone, increased filtration, velocity, and the overall stability of a dam on rocky soil is lost. During the construction of dams on ice-saturated sedimentary soils, the latter must be completely stripped from the foundation if their thickness is insufficient, and replaced with high-quality soils. If the thickness of ice-saturated soils is substantial, then the core of the dam must be filled with less ice-saturated soils. The latter should cut completely through the ice-saturated soils. The dimensions of the spillway should be determined on the basis of careful analysis of the hydrological mode of the stream. Wherever relief permits, the spillway should be built outside of the front created by the dam. Otherwise, filration may occur, altering the thermal mode of the facilities, resulting ininevitable losses of filration resistance. (Sims-ISWS)

STUDY OF RIVER MEANDERING IN THE SEARCH FOR TECTONIC STRUCTURES (AS EXEMPLIFIED BY THE MIDDLE DNIESTER REGION),
V. Ya. Yeromenko, and V. P. Ivanov.
Soviet Hydrology: Selected Papers, Vol. 16, No. 1, p 9-14, 1977. 4 fig, 3 tab, 18 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 237, p 131-140, 1977.

Descriptors: *Rivers, *Meanders, *Geomorphology, *Structural geology, Analytical techniques, Aerial photography, Geology, Fractures(Geologic), Foreign research, Foreign countries, *USSR, *Dniester River(USSR).

Analysis of river meandering was used to study recent tectonic movements and to identify growing or subsiding crustal structures. River meandering was studied from aerial photographs for the purpose of obtaining information on the morphology and hydraulics of channel flows. According to this method, the rivers are divided into morphologically homogeneous reaches (free meandering, limited meandering, channel processes of the side- and midstream-bar type, rapids, etc.), their quantitative characteristics in the selected reaches are obtained, and their behavior is computed and forecast (change in channel configuration, direction and speed of sediment movement, etc.). The morphometric description of a river reach includes determination of its length, average channel slopes, width of the flood plain and channel, depths, curvature of the river (radius of curvature of the axial line of the channel), the amplitude and length of meanders, number of loops, etc. The investigations showed that some of the meander nodes on the Dniester River and most of the meanders of its middle course tributaries occur in the fracture zones of the crystalline basement lying at a depth to 400 m. STRENGTH AND BEHAVIOR OF THICK WALED REINFORCED CONCRETE CONDUITS,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Ceramic Engineering.
G. C. Ruzicka, W. L. Gamble, and B. Mohraz.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A024 250, Price codes: A09 in paper copy, A01 in microfiche. Report UILU-ENG-76-2004, May 1976. 193 p, 127 fig, 10 tab, 16 ref. DACW-73-72-C-0065.

Descriptors: *Conduits, *Culverts, *Reinforced concrete, *Laboratory tests, Strength, Strength of materials, Testing, Cracks, Reinforcement, Reinforcing steel, Concrete, Hydraulic structures, Concrete structures, Dams, Earth dams, Beams(Structural), Finite element analysis, Engineering, Civil engineering, *Box culverts.

The results of tests of 8 three-opening reinforced concrete conduits designed for soil loadings of 30 k/sq ft were presented and discussed. The test specimens were 3/8 scale models of prototype designs, and were constructed with conventional deformed bars and concrete with 1-inch aggregate. The clear span-depth ratios in critical members ranged from 2.5 to 5.6. External loads were applied in both vertical and horizontal directions simultaneously, so that significant thrusts were acting in all members in addition to the bending and shear forces. Failure loads ranged from 82.5 to 150 k/sq ft vertical load for members with span-depth ratios of 4.0 or less. Horizontal loads of 60 to 75 k/sq ft produced failures in members with span-depth ratios of 5.6. All members failed in shear. A lower bound to the test data was suggested as a function of sq root of (f sub c prime), the span-depth ratio, and the longitudinal compression acting on the member. No strong influence of the reinforcement ratio was found. When other test results were compared, there did not appear to be a strong influence of the moment-shear ratio as expressed by the variable Vd/M. (Sims-ISWS)

DESIGN AND PROOF TEST REQUIREMENTS FOR PRECAST REINFORCED CONCRETE BOX CULVERTS,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
H. M. F. Ghanem, and J. P. Lloyd.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 297, Price codes: A06 in paper copy, A01 in microfiche. Report FHWA-RD-77-S0613, March 1977. 100 p, 41 fig, 9 tab, 20 ref.

Descriptors: *Culverts, *Reinforced concrete, *Laboratory tests, Strength, Strength of materials, Testing, Cracks, Concrete, Conduits, Hydraulic structures, Drains, Surface drainage, Design, Reinforcement, Reinforcing steel, Engineering, Civil engineering, *Box culverts, Crack control, Proof tests.

The accuracy of a proposed proof test for single cell box culverts was verified by testing 16 full-size specimens. The proof test involved placing a symmetrical arrangement of concentrated loads against the upper and lower slabs. The measured strength was compared to that predicted by yield line theory. It was shown that for culverts reinforced with welded wire fabric, the plastic moment capacity should be used on the tensile strength of the wire. For culverts reinforced with deformed bars, the plastic moment could be based on the yield strength of the reinforcement; however, because of strain hardening, the proof test procedure occasionally underestimated the actual capacity. It was found that the proof test could detect significant deficiencies in either sytle of flexural reinforcement. Efforts to develop a nondestructive proof test based on crack width were unsuccessful. An ancillary study involving 24 beams considered the influence of reinforcement sytle on the width of flexural creacks under sustained loading conditions. It was found that deformed bars provided significantly better crack control than smooth welded wire fabric. (Sims-ISWS)

8G. Materials

DRILLERS FIND INCREASING USE FOR PLASTIC PIPE,
Universa Oil Products, St. Paul, MN. Johnson Div.
J. S. Miller.
The Johnson Drillers Journal, p 5-6, September-October, 1978.

Descriptors: *Well casings, *Plastic pipes, *Well construction, Pressure, Hydrostatic design stress, Corrosion.

Increasing use of plastic casing and screens in water wells is due to their immunity to corrosion, ease of assembly and cutting, light weight, high strength-to-weight ratio, and low cost. However, plastic casing can only be installed in holes that have been drilled by rotary or auger methods since it can't be driven. Plastic casing also requires special handling to avoid knicks, scratches and bends. Since plastic has a lower collapse strength improperly installed gravel pack can cause the casing to collapse. Each diameter of plastic casing is available in a number of wall thicknesses and consequently different interior diameters. There are numerous plastic materials available of various types, grades, and design stress. A formula to determine the pressure rating for any plastic casing is given and the procedure for proper field assembly is discussed. Plastic pipe will never fully replace steel casing but it is another special, useful tool for the professional driller, and another forward step for the well drilling industry. (Purdin-NWWA)
W79-02177

THE DOWNHOLE TV CAMERA CAN 'SEE' WHAT'S WRONG,
Well Surveys Co., Hereford, TX.
R. P. Coneway, and S. Coneway.
The Johnson Drillers Journal, p 1, 12, September-October, 1978.

Descriptors: *Borehole camera, *Water wells, *Subsurface investigations, Inspection, Surveying instruments, Photography.

The downhole, closed-circuit TV camera permits visual inspection of open bore or core holes above and below water. Problems that are pin-pointed include: casing damage or ruptures, encrusted screen areas, corrosion effects, and foreign objects. Accurate pictures can be obtained at depths of 2500 feet under 900 psi in holes as small as 3 1/2 inches. The survey is recorded on video tape with an audio narrative explaining it. The downhole camera is particularly valuable in the redevelopment and rehabilitation of older wells. However, newly completed wells should be surveyed and yearly maintenance and redevelopment programs for municipal, industrial and government wells should specify a survey. (Purdin-NWWA)
W79-02178

A NOTE ON PACKER, SLUG, AND RECOVERY TESTS IN UNCONFINED AQUIFERS,
Tel-Aviv Univ. (Israel). School of Engineering.
G. Dagan.
Water Resources Research, Vol. 14, No. 5, p 929-934, October, 1978. 3 fig, 1 tab, 4 ref.

Descriptors: *Packer tests, *Slug tests, *Recovery tests, *Unconfined aquifers, *Permeability, Hydraulic conductivity, Aquifer characteristics, Aquifer testing, Flow, Numerical analysis, Computer models.

Packer, slug and recovery tests determine the permeability of unconfined aquifers of low hydraulic conductivity. Storativity plays a negligible role since water injected or removed from the wells is of small enough quantity that the water table remains horizontal and the flow steady. The ratios of well length (L) to well radius (rw) and head (H) to rw are larger, while the permeability is low. It is assumed that the formation is homogeneous near the well. Simple computer programs, the method of determining permeability, and graphs applicable to a wide range of parameters are discussed. The flow problem is solved by source distribution along the well axis. This method can be used for more complex configurations such as packer tests in wells inclined with respect to the vertical. The main limitation of the method is the requirement that the length of the active part of the well should be much larger than the well radius. (Purdin-NWWA)

TIRE MODULE SYSTEMS IN SHORE AND HARBOR PROTECTION,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
J. M. Armstrong, and R. C. Petersen.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 104, No. WW4, Proceedings Paper 14182, p 357-374, November 1978. 13 fig, 2 tab, 8 ref.

Descriptors: *Breakwaters, *Shore protection, *Costs, *Protection, Damages, Erosion control, Erosion, Filrers, Harbors, Lakes, Construction, Retaining walls, *Tires, *Modular structures, Cloth, Ice pressure, Waste recycling, Wave damping.

Experimental testing indicated the potential value of using discarded tires as a construction material for low cost shore and harbor protection. The modular assembly methods and use of available connecting materials were examined for an 18-tire module. Engineering design parameters, material cost, and field tests for both floating tire breakwaters and tire revetments were summarized. Floating tire breakwaters were described that provide wave attenuation in marinas and small harbors in both slat and freshwater. Descriptions of two tire revetment test sites on the Great Lakes were presented. Limited monitoring efforts showed that the concept of tire revetment mats seems to hold promise as a low cost approach to certain shore erosion problems. (Roberts-ISWS)

FLOW MONITORING,
C. A. McClure.
U.S. Patent No. 4,111,044, 7 p 7 fig, 8 ref; Official Gazette of the United States Patent Office, Vol. 974, no 1, p 76, September 5, 1978.

Descriptors: *Patents, *Monitoring, *Measurement, Channels, Open channels, Flow, Channel flow, Flow characteristics, Pneumatic action.

This invention relates to monitoring of liquid flow in a channel open to the atmosphere by means requiring no electrical power. The objects of the invention are accomplished, in a method of monitoring flow in an open channel, by pneumatically sensing pressure of overlying liquid in the channel as depth of such liquid trasmitting changes in the sensed depth at the instance of pneumatic energization of means for doing so, characterizing depth as flow of liquid in the channel, and indicating such liquid flow. The pressure sensing and the transmittal of changes in sensed depth are accomplished pneumatically, via a bubbler tube and bellows plus self-balancing cam-and-valve means for controlling rotation of an air motor. OPTIMIZATION AND TESTING OF HIGHWAY MATERIALS TO MITIGATE ICE ADHESION,
Washington State Univ., Pullman
M. Krukar, and J. C. Cook.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 927, Price codes: A08 in paper copy, A01 in microfiche. Interim Report No EPA-600/2-78-035, March 1978. 156 p, 38 fig, 62 tab, 22 ref, 3 append. R-804660

Descriptors: *Highway icing, *Paving, *Asphalt, *Materials testing, *Rubber, Laboratory tests, Paints, Freeze-thaw tests, Road construction, Pollution, Toxicity, Ice breakup, Deicers, Snow removal, Pullman, Washington.

The continued development of cost-effective highway coatings, which would reduce the adherence of ice on pavement surfaces is discussed. Formulations of paint/DC 732, DrisSil 73/DC 732, Petroset AT, and Viscopin B were selected on the basis of tests concerning the magnitude and stability of their contact angles, ice release abilities on asphalt and concrete, skid resistance levels on asphalt, durability/wear properties on asphalt and concrete, and environmental contamination potentials Petroset AT and Viscospin B were applied in two concentration levels in 1.6-in asphalt overlays on the Washington State University (WSU) Test Track for laboratory testing. Data obtained from the WSU Test Track includes: air and surface temperatures; visual observations of water beading and ice release; photographs of coating and substrate conditions; and coating skid values. Various combinations of tire types were used to study their effects. Due to the mild 1976-77 winter, tests were limited, but the data did allow a ranking of the coatings. The three rubberized asphalt sections and the two Petroset asphalt sections were most effective; the best rubberized asphalt section showed reduced abrasion resistance, thus negating its other performance. Petroset, the only formulation deemed toxic, also showed high hydrocarbon runoff levels. It is recommended that more testing be done to confirm the results, to compare existing snow/ice control methods, and to obtain additional traffic wear data. (Davison-IPA)

ELECTRON MICROSCOPY
Investigation of the Microflora of Swamp Ore and Lake Water by the Method of Electron Microscopy, (In German),
W79-02423 5A

ELECTRONIC EQUIPMENT
Ozone Treatment of Cyanide-Bearing Plating Waste,
W79-02299 5D

EMERGENCIES
Disaster Response to Flash Flood,
W79-02193 8B

EMPLOYMENT
The Need for Professionalism and its Attributes in Hydrogeology,
W79-02174 6E

ENVIRONMENTA EFFECTS
Effects of Forest Workings on Streamflow and Water Quality (Part I),
W79-02005 5C

ENVIRONMENTAL CONTROL
Survey of Environmental Regulations Applying to Geothermal Exploration, Development, and Use,
W79-02410 5G

ENVIRONMENTAL ECONOMICS
Economics of Wilderness Resources,
W79-02072 6B

ENVIRONMENTAL EFFECTS
The Effects of Weed-Cutting on the Macro-Inverterate Fauna of a Canalised Section of the River Hull, A Northern English Chalk Stream,
W79-02002 5C

Quantification, Decision-Making and Environmental Impact Assessment in the United Kingdom.
W79-02028 6G

Sedimentation in Hot Creek in Vicinity of Hot Creek Fish Hatchery, Mono County, California,
W79-02128 2J

Environmental Impact Assessment: An Aquatic Biologist's Point of View,
W79-02222 6G

Land Use and Intensive Range Management in the Sierra Nevada Foothills--A Contemporary Analysis,
W79-02293 4D

Aquatic Disposal Field Investigations Duwamish Waterway Disposal Site Puget Sound, Washington, Evaluative Summary,
W79-02350 5C

Hazardous Waste Disposal Damage Reports, Document No 2.
W79-02443 5E

ENVIRONMENTAL EVALUATION SYSTEM
Quantification, Decision-Making and Environmental Impact Assessment in the United Kingdom.
W79-02028 6G

ENZYMES
The Effects of Polychlorinated Biphenyls on Plasma Steroid Levels and Hepatic Microsomal Enzymes in Fish,
W79-02453 5C

EPIPHYTES
Seasonal Changes in the Epiphyte Community of Natural and Artificial Macrophytes in Lake Memphremagog (QUE. and VT.),
W79-02232 5C

EQUATIONS
Dynamic Analysis of Commercial Fishing Model,
W79-02063 6C

EQUILIBRIUM
The Long-Run Movement of the Prices of Exhaustible Resources,
W79-02026 6C

EROSION
Land Use and Intensive Range Management in the Sierra Nevada Foothills--A Contemporary Analysis,
W79-02293 4D

ESSENTIAL NUTRIENTS
The Uptake, Retention, and Release of Ammonium by Reef Corals,
W79-02228 5C

ESTHWAITE WATER (UNITED KINGDOM)
Specific Blue-Green Algal Carotenoids in Sediments of Esthwaite Water,
W79-02246 5C

ESTIMATING EQUATIONS
An Evaluation of Phosphorus-Chlorophyll-Phytoplankton Relationships of Lakes,
W79-02247 5C

ESTUARIES
Transportation and Accumulation of Fine-Grained Sediments in the Estuarine Environment: Recommendations for Research,
W79-02165 2L

Surface Drifter Movements Observed in Port Angeles Harbor and Vicinity, April 1978,
W79-02221 2L

Seasonal Fluctuation of Water Quality (Nutrients and Pigments) in Lower Delaware Bay,
W79-02223 5C

Polychlorinated Biphenyls in Coastal Marine Zooplankton: Bioaccumulation by Equilibrium Partitioning,
W79-02242 5C

Velocity Averaging in Estuaries Characterized by a Large Tidal Range to Depth Ratio,
W79-02355 2L

ESTUARINE ENVIRONMENT
Transportation and Accumulation of Fine-Grained Sediments in the Estuarine Environment: Recommendations for Research,
W79-02165 2L

Intertidal Environment of Northern Dublin Bay,
W79-02204 5B

ESTUARINE FLOW VELOCITIES
Velocity Averaging in Estuaries Characterized by a Large Tidal Range to Depth Ratio,
W79-02355 2L

EUTROPHICATION
A Survey of Phosphorus and Nitrogen Levels in Treated Municipal Wastewater,
W79-02003 5A

A Dynamic Lake Model for Trophic State Prediction,
W79-02006 5C

Examination of a Lake Model,
W79-02007 5C

A Simulation Model for Phytoplankton Growth and Nutrient Cycling in Eutrophic, Shallow Lakes,
W79-02008 5C

Trophic Structure Modifications by Planktivorous Fish in Aquatic Microcosms,
W79-02013 5C

Kinetics of Phosphate Uptake by Aquatic Microorganisms: Deviations from a Simple Michaelis-Menten Equation,
W79-02016 5C

Prediction of Phytoplankton Productivity in Lakes,
W79-02055 5C

The Role of Silica and the Vernal Diatom Bloom in Controlling the Growth of Nuisance Algal Populations in Lakes,
W79-02152 5C

Blooms of Surf-Zone Diatoms Along the Coast of the Olympic Peninsula, Washington, IX. Factors Controlling the Seasonal Cycle of Nitrate in the Surf at Copalis Beach (1971 through 1975),
W79-02244 5C

Specific Blue-Green Algal Carotenoids in Sediments of Esthwaite Water,
W79-02246 5C

An Evaluation of Phosphorus-Chlorophyll-Phytoplankton Relationships of Lakes,
W79-02247 5C

Recent Changes in Plankton Communities and Present Trophic State of Lake Steinsfjord,
W79-02250 5C

A Paleolimnological Comparison of Burntside and Shagawa Lakes, Northeastern Minnesota,

EXCLUSIVE ECONOMIC ZONE
A Note on the Welfare-Economic Consequences of Extended Fishing Limits.
W79-02047 6E

The Economic Consequences of the 200-Mile Seabed Zone: The Replenishable Resources Case,
W79-02048 6E

EXPLORATION
The Blind Zone in Seismic Ground-Water Exploration,
W79-02190 4B

EXPORT
Overseas Markets for the Water Industry - Nigeria,
W79-02030 5G

Optimal and Competitive Use of Replenishable Natural Resources by Open Economies.
W79-02058 6C

FACIES (SEDIMENTARY)
Subsurface Geological Investigation of a Pleistocene Braided Stream in the Northern Coastal Plain, Delaware (U.S.A.),
W79-02167 2J

FALLOUT
Atmospheric Formation, Dispersion, and Deposition of Acid Substances,
W79-02015 5A

FARM WASTES
Protein Production Rates by Algae Using Swine Manure as a Substrate,
W79-02489 5D

FAULTS
Holocene Faulting in the Western Grand Canyon, Arizona,
W79-02496 2J

FEDERAL-STATE WATER RIGHTS CONFLICTS
Procedural Inconsistencies and Substantive Issues in the Federal Reserved Water Rights Doctrine. Case Note, United States v. Akin, 504 F.2d 115 (10th Cir. 1974),
W79-02084 6E

FEDERAL WATER POLLUTION CONTROL AMENDMENTS OF 1977
EPA's Construction Grants Program: Perspectives Costs,
W79-02027 5G

FEEDING RATES
The Influence of Salinity and Temperature on Growth, Metabolism and Lethal Temperature of the Sand Goby, Pomatoschistus Microps K. (Der Einfluss Von Salzgehalt und Temperatur Auf Wachstum Stoffwechsel und Letaltemperatur Der Strandgrundel Pomatoschistus Microps K.),
W79-02466 5C

FERNS
Seasonal Changes in the Distribution of Water Fern and Duckweed in Cypress Domes Receiving Sewage,
W79-02262 2I

FERTILIZATION
Zinc Nutrition of Rice as Influenced by Rates of Gypsum and Zn Fertilizaton of Alkali Soils,
W79-02099 3F

FERTILIZERS
Sugar Cane Growth in Response to Mulch and Fertilizer on Saline-Alkali Subsoils,
W79-02029 3C

Residual Forms of Fertilizer Nitrogen in Field Soils,
W79-02364 2K

FILAMENTOUS ALGAE
Use of Fluorescence Microscopy for Quantifying Phytoplankton, Especially Filamentous Blue-Green Algae,
W79-02239 5C

FILTERS
Drive Device for Rake Arm with Attached Screen Comb in Cleaning Device for a Water Conduit Screen,
W79-02306 8C

FILTRATION
Filration System,
W79-02332 5D

FINANCING
Financing System Changes,
W79-02023 6C

Structuring Water Utility Bond Issues to Cope with Inflation,
W79-02024 6C

EPA's Construction Grants Program: Perspectives Costs,
W79-02027 5G

FINE GRAINED SOILS
Perimeter Dike Raising with Dewatered Fine-Grained Dredged Material at Upper Polecat Bay Disposal Area, Mobile, Alabama,
W79-02345 5E

FIRMS
'The Relationship Between Firm and Fishery in Common Property Fisheries': Comment,
W79-02060 6B

'The Relationship Between Firm and Fishery in Common Property Fisheries': Reply,
W79-02061 6B

FISH
Trophic Structure Modifications by Planktivorous Fish in Aquatic Microcosms,
W79-02013 5C

Application of a Model of Zooplankton Composition to Problems of Fish Introductions to the Great Lakes,
W79-02020 5C

Fish Test With Golden Orfe -- Testing the Toxicity of Matter Contained in Water (Fischtest mit Goldorfen -- Pruefung der Toxizitaet von Wasserinhaltsstoffen),

Potential for Downward Leakage to the Floridan Aquifer, Green Swamp Area, Central Florida,
W79-02136 7C

GROUNDWATER RESOURCES
Public Groundwater Supplies in Kane County,
W79-02075 4B

Geology and Groundwater Resources of Northern Berks County, Pennsylvania,
W79-02132 2F

Major Aquifers in Clark County, South Dakota,
W79-02134 2F

GROUNDWATER SOURCES
Geophysical Delineation of Buried Glacial River Valley Aquifers in Grundy County, Missouri,
W79-02154 2F

GROWTH RATES
Cypress Growth Response in a Sewage-Enriched Pond Cypress Ecosystem,
W79-02287 5C

Studies of the Ecology of Fish Populations in the Rye Meads Sewage Effluent Lagoons,
W79-02454 5C

Effects of Some Environmental Factors on Growth and Food Consumption of the Baltic Palaemonid Shrimp, Palaemon Adspersus Var. Fabricii (Rathke),
W79-02465 5C

The Influence of Salinity and Temperature on Growth, Metabolism and Lethal Temperature of the Sand Goby, Pomatoschistus Microps K. (Der Einfluss Von Salzgehalt und Temperatur Auf Wachstum Stoffwechsel und Letaltemperatur Der Strandgrundel Pomatoschistus Microps K.),
W79-02466 5C

Growth-Influencing Substances in Sediment Extracts from a Subtropical Wetland: Investigation Using a Diatom Bioassay,
W79-02476 5C

GROWTH STAGES
Potential Importance of Benthic Cysts of Gonyaulax Tamarensis and G. Excavata Initiating Toxic Dinoflagellate Blooms,
W79-02011 5C

GULF COASTAL PLAIN
Geographic Variations in Salt Marsh Macrophyte Productions: A Review,
W79-02098 2H

GULF OF FINLAND
Seiches in the Baltic Sea and Their Effect on Floods in the Neva River Delta,
W79-02213 2L

GULF OF MEXICO
Control of 1973 Mississippi River Flood,
W79-02195 4A

Flume Experiments on Sand, Silt, and Clay Mixtures from the Offshore Dredged Material Disposal Site, Galveston, Texas,
W79-02348 5E

GULP OF MEXICO
Origins of Water and Solutes in the Geopressured Zones of the Northern Gulf of Mexico Basin,
W79-02131 2K

GYPSUM
Zinc Nutrition of Rice as Influenced by Rates of Gypsum and Zn Fertilizaton of Alkali Soils,
W79-02099 3F

HARBOR SEALS
Further Data on Heavy Metals and Organochlorines in Marine Mammals from German Coastal Waters,
W79-02460 5B

HARBORS
Liquefaction Potential of Hydraulic Fills,
W79-02203 8D

HARVESTING
Increasing Efficiency of Aquatic Plant Management Through Processing,
W79-02158 4A

HATCHING
Effects of Simulated Flooding on Alligator Eggs,
W79-02116 2L

HAZARDOUS WASTES
Assessment of Hazardous Waste Practices in the Petroleum Refining Industry,
W79-02440 5D

HAZARDS
Hazardous Material Spills: A Documentation and Analysis of Historical Data,
W79-02411 5G

HEART COCKLE
Effects of Burial on the Heart Cockle Clinocardium Nuttallii and the Dungeness Crab Cancer Magister,
W79-02472 5C

HEAT EXCHANGERS
Research on Control Technology for Ice Fog From Mobile Sources,
W79-02147 5G

HEAT PUMPS
The Impact of the Use of Heat Pumps on Groundwater Temperatures,
W79-02192 4B

HEAT TREATMENT
Investigations of Heat Treatment for Paper Mill Sludge Conditioning,
W79-02296 5E

HEAVY METAL
Microorganisms and Heavy metal Toxicity,
W79-02483 5C

HEAVY METALS
Ability of Salt Marshes to Remove Nutrients and Heavy Metals from Dredged Material Disposa Area Effluents,
W79-02347 5E

Further Data on Heavy Metals and Organochlorines in Marine Mammals from German Coastal Waters,
W79-02460 5B

HEBER WATERSHED (ARIZ)
Water Quality of Streamflow from Forested Watersheds on Sedimentary Soils,
W79-02404 5B

HEIGHT
Physical Properties of Icebergs, Part I--Height to Draft Ratios of Icebergs, Part II--Mass Estimation of Arctic Icebergs,
W79-02216 2C

HEOD
Organochlorine and Mercury Residues in Fish from Lake Simcoe, Ontario 1970-76,
W79-02456 5B

HEPATIC MICROSOMAL ENZYMES
The Effects of Polychlorinated Biphenyls on Plasma Steroid Levels and Hepatic Microsomal Enzymes in Fish,
W79-02453 5C

HERBICIDES
Field Persistence and Movement of Trifluralin in Two Soil Types,
W79-02417 2G

HETEROTHERMAL ENVIRONMENTS
Thermal Tolerance and Preference of the Indian Catfish Heteropneustes Fossilis,
W79-02455 5C

HETEROTROPHY
Growth-Influencing Substances in Sediment Extracts from a Subtropical Wetland: Investigation Using a Diatom Bioassay,
W79-02476 5C

HEXACHLOROBENZENE (HCB)
Organchlorines in Codfish from Harbours Along the Norwegian Coast,
W79-02479 5C

Effect of Hexachlorobenzene (HCB) on Photosynthetic Oxygen Evolution and Respiration of Chlorella Pyrenoidosa,
W79-02480 5C

HIGH FLOW
Flow Characteristics of Streams in Tutuila, American Samoa,
W79-02124 2E

HIGHWAY EFFECTS
Ecological Effects of Highway Construction Upon Michigan Woodlots and Wetlands: Soil Relationships,
W79-02429 6G

HIGHWAY ICING
Optimization and Testing of Highway Materials to Mitigate Ice Adhesion,
W79-02408 8G

HISTOLOGICAL STUDIES
Some Histopathological Effects of Aroclor 1254 on the Liver and Gonads of Rainbow Trout, Salmo Gairdneri, and Carp, Cyprinus Carpio,
W79-02452 5C

HISTOLOGY
Possible Toxic Effects of the Marine Blue-Green Alga, Spirulina Subsalsa, on the Blue Shrimp, Penaeus Stylirostris,
W79-02459 5C

HISTORIC FLOODS
Some Comparisons of Flood Statistics in Real and Log Space,
W79-02119 2E

HISTORY
Flotation of Fresh Water on Sea Water, A Historical Note,
W79-02171 2F

A Hydraulic Installation in the Water Supply System of Emmaus-Nicopolis,
W79-02394 4A

The Water Supply System of Caesarea Maritima,
W79-02399 8B

HOGS
Characterization and In-Plant Reduction of Wastewater from Hog Slaughtering Operations,
W79-02298 5D

HOLOCENE MOVEMENT
Holocene Faulting in the Western Grand Canyon, Arizona,
W79-02496 2J

HOT CREEK
Sedimentation in Hot Creek in Vicinity of Hot Creek Fish Hatchery, Mono County, California,
W79-02128 2J

HOT SPRINGS
Tritium in the Waters of Yellowstone National Park,
W79-02130 2F

HUMAN DISEASES
Bioaccumulation Potential and Acute Toxicity of Synthetic Fuels Effluents in Freshwater Biota: Azaarenes,
W79-02241 5C

HYDRAULIC CONDUCTIVITY
Water Infiltration into Uniform and Stratified Soils I. Review and Use of an Approximate Theory,
W79-02492 2G

Water Infiltration into Uniform and Stratified Soils II. Experimental Evaluation of an Approximate Theory,
W79-02493 2G

HYDRAULIC DESIGN
The Water Supply System of Caesarea Maritima,
W79-02399 8B

HYDRAULIC GRADIENT
Fossil Ground-Water Gradients in Arid Regional Sedimentary Basins,
W79-02189 2F

HYDRAULIC MODELS
Physical Model Simulation of the Hydraulics of Masonboro Inlet, North Carolina,
W79-02353 8B

Shoaling Conditions in Sawyer Bend and Lower Entrance to Chain of Rocks Canal, Mississippi River; Hydraulic Model Investigation,
W79-02354 8B

Hydraulic Model Tests of the Proposed Weir for the Richelieu River at St. Jean, Quebec,
W79-02414 8C

HYDRAULIC SIMILITUDE
Physical Model Simulation of the Hydraulics of Masonboro Inlet, North Carolina,
W79-02353 8B

HYDROGEN SULFIDE
Dissolved Hydrogen Sulfide in Soil Water in San Felasco Hammock and Deerhaven Cypress Dome,
W79-02285 5B

HYDROGEOLOGY
Geology and Groundwater Resources of Northern Berks County, Pennsylvania,
W79-02132 2F

Flotation of Fresh Water on Sea Water, A Historical Note,
W79-02171 2F

Hydrology of the Austin Cary Control Dome,
W79-02260 5E

HYDROGRAPH ANALYSIS
Forecast of the Flash Flood Hydrograph on the Ingoda River,
W79-02207 4A

HYDROLOGIC BUDGET
Complex Relations Between the Hydrologic Budget of the Major Geographic Zones of the Earth,
W79-02208 2A

Hydrologic Budget Model,
W79-02258 2H

HYDROLOGIC DATA
Directory of Member Organizations of the National Water Data Exchange (NAWDEX),
W79-02123 10D

Water Resources Data for Washington, Water year 1977--Volume 1. Western Washington.
W79-02138 7C

Water Resources Data for Washington, Water year 1977--Volume 2. Eastern Washington.
W79-02139 7C

Water Resources Data for Tennessee, Water Year 1977.
W79-02140 7C

Water Resources Data for Georgia, Water Year 1977.
W79-02141 7C

HYDROLOGIC EQUATION
Complex Relations Between the Hydrologic Budget of the Major Geographic Zones of the Earth,
W79-02208 2A

HYDROLOGIC PROPERTIES
Hydrology and Water Budgets of Cypress Domes,
W79-02257 5B

HYPOPHYSIS
Effect of Methallibure on the Hypophysis and Gonadal Development of the Cichlid Fish, Tilapia Mossambica,
W79-02477 5C

HYPOXIA
Blood Corpuscle Resistance of Carp Died of Environmental Hypoxia and of Cyanide Poisoning, (In Japanese),
W79-02471 5C

ICE FOG
Research on Control Technology for Ice Fog From Mobile Sources,
W79-02147 5G

ICEBERGS
Physical Properties of Icebergs, Part I--Height to Draft Ratios of Icebergs, Part II--Mass Estimation of Arctic Icebergs,
W79-02216 2C

ILLINOIS
Public Groundwater Supplies in Kane County,
W79-02075 4B

Control of 1973 Mississippi River Flood,
W79-02195 4A

Preliminary Evaluation of Final Cut Lakes,
W79-02292 5G

IMPACT (RAINFALL)
Splash and Discontinuous Runoff as Creators of Fine Sandy Lag Deposits with Kalahari Sands,
W79-02393 2J

IMPERIAL VALLEY (CALIF)
Making the Desert Flower: Irrigating California's Imperial Valley,
W79-02092 3F

IMPINGEMENT
Ecological Effects of Cooling Water of a Power Plant at Kiel Fjord,
W79-02461 5C

IMPOUNDMENTS
The Colonization of Cabora Bassa, Mocambique, A New Man-Made Lake, by Floating Aquatic Macrophytes,
W79-02231 4A

INDIAN CATFISH
Thermal Tolerance and Preference of the Indian Catfish Heteropneustes Fossilis,
W79-02455 5C

INDIANA
Subsurface Stratigraphy and Water Resources of Cass County, Indiana,
W79-02185 4B

INDICATORS
Implications of Alternative Measures of Natural Resource Scarcity,
W79-02049 6B

INDUSTRIAL PRODUCTION
Natural Resources and Environmental Restrictions to Growth,
W79-02056 6G

INDUSTRIAL WASTES
Process for Reducing the Mercury Content of Industrial Waste Waters,
W79-02313 5D

Method of Treating a Waste Liquid Containing Polluting Compounds,
W79-02324 5D

Process for Recovering Proteinaceous Matter from Acid Whey and Tannery Unhairing Effluents,
W79-02334 5D

Grease Separator,
W79-02342 5D

Waste Fluid Treatment System,
W79-02343 5D

Wastewater Treatment Technology Documentation for Toxaphene Manufacture,
W79-02439 5D

Assessment of Hazardous Waste Practices in the Petroleum Refining Industry,
W79-02440 5D

Wastewater Treatment Technology Documentation for DDT Manufacture,
W79-02444 5D

Benzidine: Wastewater Treatment Technology,
W79-02445 5D

INDUSTRIAL WATER
Polyquaternary Compounds for the Control of Microbiological Growth,
W79-02331 5D

INDUSTRIES
Coordinating Public Utility Expansion, Industrial Siting and Pollution Control: A Working Dynamic Programming Algorithm,
W79-02039 5G

INFILTRATION
Transpiration Effects on Leaching Fractions,
W79-02019 3C

INFLATION (ECONOMIC)
Structuring Water Utility Bond Issues to Cope with Inflation,
W79-02024 6C

INGODA RIVER (USSR)
Forecast of the Flash Flood Hydrograph on the Ingoda River,
W79-02207 4A

INJECTION
Improved Techniques for Evaluating Carbonate Waterfloods in West Texas,
W79-02182 4B

Underground Injection Control Program Studied,
W79-02184 5G

INLAND WATERWAYS
Studying the Economics of a Waterway: A Critique of Studies of the McClellan-Kerr Arkansas River Navigation System,
W79-02052 6B

INORGANIC COMPOUNDS
Photosynthetic Rates of Marine Algae as a Function of Inorganic Carbon Concentration,
W79-02224 5C

Partial Characterization of Chlorinated Organics in Superchlorinated Septages and Mixed Sludges,
W79-02413 5D

INSECTICIDES
Wastewater Treatment Technology Documentation for Toxaphene Manufacture,
W79-02439 5D

Insecticide Persistence in Natural Seawater as Affected by Salinity, Temperature, and Sterility,
W79-02487 5B

INSECTS
Do Tides Affect Coastal Insect Communities,
W79-02089 2L

INSTITUTIONAL CONSTRAINTS
Urban Water: Access, Delivery and Institutional Scarcity,
W79-02036 6E

INSTREAM FLOW (WINTER)
Telemetric Determination of Salmonid Winter Micro-Habitat Occupation and Movement in Ice-Covered Streams,
W79-02157 7B

INSTRUMENTATION
Systematic Absorbance Errors with Technicon AutoAnalyzer II Colorimeters,
W79-02074 2K

Instruments for Monitoring the Quality of Natural and Waste Waters,
W79-02214 5A

Full-Season Rain Gauge Having Replaceable Charts for Making Profile Graphs,
W79-02304 7B

Material Content of Binary Physical Mixture as Measured with a Dual-Energy Beam of Gamma Rays,
W79-02356 2G

INTENSIVE SITE PREPARATION
Consequences of Site Disturbances in the Upper Coastal Plain,
W79-02431 4D

INTER-BASIN TRANSFER
Geographic Aspects of the Territorial Redistribution of Water Resources,
W79-02209 4A

INTERNATIONAL LAW
A Note on the Welfare-Economic Consequences of Extended Fishing Limits,
W79-02047 6E

The Economic Consequences of the 200-Mile Seabed Zone: The Replenishable Resources Case,
W79-02048 6E

Exploitation of Common-Property Replenishable Natural Resources,
W79-02070 6B

INTERNATIONAL TRADE
Overseas Markets for the Water Industry - Nigeria,
W79-02030 5G

The Price of Natural Resources,
W79-02045 6C

INTERNATIONAL WATERS
A Note on the Welfare-Economic Consequences of Extended Fishing Limits,
W79-02047 6E

The Economic Consequences of the 200-Mile Seabed Zone: The Replenishable Resources Case,
W79-02048 6E

INTERSTICES
Interstital Water Chemistry of Anoxic Long Island Sound Sediments. 2. Nutrient Regeneration and Phosphate Removal,
W79-02243 5C

INTERTIDAL AREAS
Intertidal Environment of Northern Dublin Bay,
W79-02204 5B

Soft-Shore Macrobenthos Along the South-West Coast of Wales,
W79-02240 5C

INVERTEBRATES
The Effects of Weed-Cutting on the Macro-Inverterate Fauna of a Canalised Section of the River Hull, A Northern English Chalk Stream,
W79-02002 5C

Aquatic Invertebrate Abundance in Relation to Changing Marsh Vegetation,
W79-02095 2H

Effect of Antimycin on Stream Insects in Field and Laboratory Trials,
W79-02156 5C

The Response of Benthic Invertebrate Populations to Sewage Addition,
W79-02267 5C

ION TRANSPORT
Role of Inorganic Ions in Controlling Sedimentation Rate of a Marine Centric Diatom Ditylum Brightwelli,
W79-02014 5C

Ion Mobilities in Pure Water Vapour at Saturation,
W79-02076 1B

IRELAND
Intertidal Environment of Northern Dublin Bay,
W79-02204 5B

IRON BACTERIA
Redox Potential Measurements as an Indication of Biochemical Well Plugging,
W79-02170 5A

Investigation of the Microflora of Swamp Ore and Lake Water by the Method of Electron Microscopy, (In German),
W79-02423 5A

IRON OXIDES
Mechanism of Zinc Adsorption by Iron and Aluminum Oxides,
W79-02359 2K

IRRIGATION
Issues in Water Development Decisions: A Discussion Paper,
W79-02042 6B

Water Utilization and Reallocation in Chile: A Study of the Pirque Valley,
W79-02053 6B

Water Quality Can Affect Management Planning,
W79-02096 5G

Reciprocable Sprinkler,
W79-02318 3F

Wind, Sprinkler Patterns, and System Design,
W79-02368 3F

IRRIGATION DESIGN
Wind, Sprinkler Patterns, and System Design,
W79-02368 3F

RRIGATION EFFECTS
Tillage Effects on Winter Wheat Production Where the Irrigated and Dryland Crops are Alternated,
W79-02088 3F

Controlling Sediment in Surface Runoff,
W79-02097 3F

RRIGATION EFFICIENCY
Drip Study Shows up to 30% Water Savings,
W79-02090 3F

Wind, Sprinkler Patterns, and System Design,
W79-02368 3F

RRIGATION PRACTICES
Calculating the Cost of Each Irrigation,
W79-02094 3F

Treatment of High Strength Meatpacking Plant Wastewater by Land Application,
W79-02301 5D

SOTOPE STUDIES
Chemical Characterization of Local and Stratospheric Plutonium in Ohio Soils,
W79-02320 5A

SRAEL
The Nature of Basalt Weathering in Israel,
W79-02238 2G

SRAEL (HULA VALLEY)
Hula Valley Peat: Review of Chemical and Geochemical Aspects,
W79-02365 2K

WANAI HARBOR (JAPAN)
The Effect of Silt-Fence on the Prevention of Sea Water Siltation Caused by Dredging and Reclaiming Work in Harbor, (In Japanese),
W79-02481 5C

APAN
Effects of Forest Workings on Streamflow and Water Quality (Part I),
W79-02005 5C

ET PUMPS
Water Systems Basics, (2),
W79-02181 8C

ANE COUNTY (ILL)
Public Groundwater Supplies in Kane County,
W79-02075 4B

ANSAS
Gradient, Discharge, and Particle-Size Relations of Alluvial Channels in Kansas, With Observations on Braiding,
W79-02120 2J

ARST
The Origin of Labyrinth and Tower Karst and the Climatic Conditions Necessary for Their Development,
W79-02073 2F

EL FJORD
Ecological Effects of Cooling Water of a Power Plant at Kiel Fjord,
W79-02461 5C

NETICS
Kinetics of Phosphate Uptake by Aquatic Microorganisms: Deviations from a Simple Michaelis-Menten Equation,
W79-02016 5C

Kinetics of Algal Transient Phosphate Uptake and the Cell Quota Concept,
W79-02237 5C

KOOTENAY LAKE (B C CANADA)
Simulation Model of Cryptomonas Ovata Population Dynamics in Southern Kootenay Lake, British Columbia,
W79-02225 5C

KRAFT MILLS
New Pulp Mill Strikes Low Profile.
W79-02102 5D

Sulfate Turpentine in Unpurified and Purified Effluents from the Baikal Pulp Mill (Sul'fatnyi skipidar v neochishchennykh i ochishchennykh stokakh Baikal'skogo Tsellyuloznogo Zavoda),
W79-02378 5B

LABORATORIES
Procedure for the Evaluation of Environmental Monitoring Laboratories,
W79-02149 5A

LABORATORY TESTS
Anion Exchange Method for the Determination of Plutonium in Water: Single-Laboratory Evaluation and Interlaboratory Collaborative Study,
W79-02145 5A

Strength and Behavior of Thick Waled Reinforced Concrete Conduits,
W79-02217 8F

Design and Proof Test Requirements for Precast Reinforced Concrete Box Culverts,
W79-02218 8F

Comparison of Methods for the Determination of Total Available Residual Chlorine in Various Sample Matrices,
W79-02412 5A

Partial Characterization of Chlorinated Organics in Superchlorinated Septages and Mixed Sludges,
W79-02413 5D

LABYRINTH KARST
The Origin of Labyrinth and Tower Karst and the Climatic Conditions Necessary for Their Development,
W79-02073 2F

LAGOONS
Hypersaline Lagoonal Deposits and Processes,
W79-02430 2L

LAKE APOPKA (FLA)
Aquatic Vascular Plants of Lake Apopka, Florida,
W79-02420 2I

LAKE BRIELLE (NETH)
Wind Induced Dispersion and Algal Growth in Shallow Lakes,
W79-02226 5G

LAKE CABORA BASSA (MOCAMBIQUE)
The Colonization of Cabora Bassa, Mocambique, A New Man-Made Lake, by Floating Aquatic Macrophytes,
W79-02231 4A

LAKE ERIE
Aquatic Disposal Field Investigations, Ashtabula River Disposal Site, Ohio; Appendix A: Planktonic Communities, Benthic Assemblages, and Fishery,
W79-02346 5E

LAKE GEORGE (NY)
Maximum Depth Inhabited by Aquatic Vascular Plants,
W79-02249 5C

LAKE GRASMERE (ENGLAND)
The Crustacean Zooplankton of Grasmere Before and After a Change in Sewage Effluent Treatment,
W79-02458 5C

LAKE MEMPHREMAGOG (VT QUEBEC)
Seasonal Changes in the Epiphyte Community of Natural and Artificial Macrophytes in Lake Memphremagog (QUE. and VT.),
W79-02232 5C

LAKE MENDOTA (WIS)
The Role of Silica and the Vernal Diatom Bloom in Controlling the Growth of Nuisance Algal Populations in Lakes,
W79-02152 5C

LAKE MICHIGAN
A Material Balance Study of Polychlorinated Biphenyls in Lake Michigan,
W79-02017 5C

Application of a Model of Zooplankton Composition to Problems of Fish Introductions to the Great Lakes,
W79-02020 5C

LAKE ONTARIO
Application of a Model of Zooplankton Composition to Problems of Fish Introductions to the Great Lakes,
W79-02020 5C

LAKE SIDNEY LANIER (GEO)
P-32 Uptake in Lentic Algae,
W79-02078 5C

LAKE SIMCOE (ONTARIO)
Organochlorine and Mercury Residues in Fish from Lake Simcoe, Ontario 1970-76,
W79-02456 5B

LAKE STAGES
Stochastic Modeling for Predicting Frequency Distribution of Stages in Thermal Lakes at Future Planning Horizons,
W79-02495 4A

LAKE STEINSFJORD (NORWAY)
Recent Changes in Plankton Communities and Present Trophic State of Lake Steinsfjord,
W79-02250 5C

LAKES
A Dynamic Lake Model for Trophic State Prediction,
W79-02006 5C

Examination of a Lake Model,
W79-02007 5C

A Simulation Model for Phytoplankton Growth and Nutrient Cycling in Eutrophic, Shallow Lakes,
W79-02008 5C

Organism Patchiness in Lakes Resulting from the Interaction Between the Internal Seiche and Planktonic Diurnal Vertical Migration,
W79-02009 5C

Prediction of Phytoplankton Productivity in Lakes,
W79-02055 5C

The Productivity of Lake Champlain wit Regard to Waterfowl, Furbearers, and Other Wildlife,
W79-02114 2H

Limnology of Selected Lakes in Ohio - 1975,
W79-02126 2H

Preliminary Evaluation of Final Cut Lakes,
W79-02292 5G

LAKES

Production of Submerged Aquatic Plant Communities of Doodhadhari Lake Raipur, (M. P. India),
W79-02419 2I

Aquatic Vascular Plants of Lake Apopka, Florida,
W79-02420 2I

LAKES *PHYTOPLANKTON
An Evaluation of Phosphorus-Chlorophyll-Phytoplankton Relationships of Lakes,
W79-02247 5C

LAMINARIA SACCHARINA
Effects of Nitrate Concentration on the Growth and Physiology of Lominaria Saccharina (Phaeophyta) in Culture,
W79-02010 5C

LAND MANAGEMENT
Profile and Measurement of Social Well-Being Indicators for Use in the Evaluation of Water and Related Land Management Planning,
W79-02344 6B

LAND RECLAMATION
Establishment of Native Plants for the Rehabilitation of Paraho Processed Oil Shale in an Arid Environment,
W79-02391 4A

Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario,
W79-02428 5C

LAND SUBSIDENCE
Land Subsidence Due to Water Withdrawal in the Vicinity of Pecos, Texas,
W79-02396 4B

LAND USE
Forested Wetlands of Florida-Their Management and Use,
W79-02112 6B

Land Use and Intensive Range Management in the Sierra Nevada Foothills--A Contemporary Analysis,
W79-02293 4D

LANDFILLS
Liquefaction Potential of Hydraulic Fills,
W79-02203 8D

LANDSCAPING
Design and the Desert Environment: Landscape Architecture in the American Southwest,
W79-02389 3B

LATE PLEISTOCENE
A Contribution to the Lake Pleistocene Stratigraphy of the Susquehanna River Valley of New York,
W79-02135 2J

LAUREL CREEK (ONTARIO)
Particulate and Dissolved Organic Matter in a Small Partly Forested Ontario Stream,
W79-02252 5C

LAW OF THE SEA
A Note on the Welfare-Economic Consequences of Extended Fishing Limits,
W79-02047 6E

LAWNS
Lawn Sprinkler Distribution Patterns,
W79-02155 3F

LEACHATE
The Uptake of Dissolved Organic Matter by a Small Spring Stream,
W79-02248 5C

The Behavio of Sulfate on Salt Input in Podzolic Brown Earth,
W79-02321 2K

LEACHING
Transpiration Effects on Leaching Fractions,
W79-02019 3C

LEAD
The Pollution of Sea-Water in Nagasaki Bay in Summer 1976 and 1977, (In Japanese),
W79-02482 5B

LEAKAGE
Potential for Downward Leakage to the Floridan Aquifer, Green Swamp Area, Central Florida,
W79-02136 7C

LEAVES
The Uptake of Dissolved Organic Matter by a Small Spring Stream,
W79-02248 5C

Litterfall and Litter Decomposition in Four Cypress Domes,
W79-02265 2I

LEGISLATION
Changing Manner and Place of Use of Water Rights in Wyoming, Comments,
W79-02083 6E

An Examination of Legislation for the Protection of the Wetlands of the Atlantic and Gulf Coast States,
W79-02106 6E

Survey of Environmental Regulations Applying to Geothermal Exploration, Development, and Use,
W79-02410 5G

LETAL LIMIT
Thermal Tolerance and Preference of the Indian Catfish Heteropneustes Fossilis,
W79-02455 5C

LIGHT
Dependence of Light-Saturated Rates of Algal Photosynthesis on Intracellular Concentrations of Phosphorus,
W79-02236 5C

LIGHT PENETRATION
Maximum Depth Inhabited by Aquatic Vascular Plants,
W79-02249 5C

Radiation Studies: Cypress Wetlands,
W79-02261 2I

LIME
Limestone and Lime Neutralization of Ferrous Iron Acid Mine Drainage,
W79-02302 5D

LIMESTONE
Combination Limestone-Lime Neutralization of Ferrous Iron Acid Mine Drainage,
W79-02150 5D

LIMESTONES
Limestone and Lime Neutralization of Ferrous Iron Acid Mine Drainage,
W79-02302 5D

LIMITED ENTRY
'The Relationship Between Firm and Fishery in Common Property Fisheries': Comment,
W79-02060 6B

'The Relationship Between Firm and Fishery in Common Property Fisheries': Reply,
W79-02061 6B

LIMITING FACTORS
Effects of Nitrate Concentration on the Growth and Physiology of Lominaria Saccharina (Phaeophyta) in Culture,
W79-02010 5C

Blooms of Surf-Zone Diatoms Along the Coast of the Olympic Peninsula, Washington, IX. Factors Controlling the Seasonal Cycle of Nitrate in the Surf at Copalis Beach (1971 through 1975),

Reduction of Nitrate in a Soil Column During Continuous Flow, W79-02366 2G

Nitrate Reduction by Denitrifying Bacteria in Single and Two Stage Continuous Flow Reactors, W79-02406 5D

Effect of Dissolved Oxygen and Redox Potential and Nitrate Removal in Flooded Swamp and Marsh Soils, W79-02426 5C

The Nutrient Contents of North Sea Water: Changes in Recent Years, Particularly in the Southern Bight, W79-02468 5B

NITRIFICATION

Significance of Nitrification in Stream Analysis-Effects on the Oxygen Balance, W79-02001 5C

NITROGEN

A Survey of Phosphorus and Nitrogen Levels in Treated Municipal Wastewater, W79-02003 5A

Ammonium Oxidation and its Significance in the Summer Cycling of Nitrogen in Oxygen Depleted Skan Bay, Unalaska Islanda, Alaska, W79-02004 5C

The Occurrence and Removal of Nitrogen in Subsurface Agricultural Drainage from the San Joaquin Valley, California, W79-02107 5G

Apparent Use of Sediment Nitrogen and Phorphorus by Plants in Malletts Creek Marsh with Implications to Lake Champlain Water Level Regulation, W79-02115 2H

The Uptake, Retention, and Release of Ammonium by Reef Corals, W79-02228 5C

Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater, W79-02235 5C

A Computer Simulation of Phosphate and Nitrogen Transport by Water Runoff, W79-02251 5B

Residual Forms of Fertilizer Nitrogen in Field Soils, W79-02364 2K

NITROGEN COMPOUNDS

Influence of Water Soluble Excreta on Oxygen Consumption of Tilapia Zillii, W79-02462 5C

NITROGEN CYCLE

A Budget of Nitrogen Recycling in North Sea Sediments off the Belgian Coast, W79-02245 5C

NITROGEN FIXING BACTERIA

Significance of Nitrification in Stream Analysis-Effects on the Oxygen Balance, W79-02001 5C

NON-DEGRADABLE COMPOUNDS

A Method of Predicting the Biological Effects of Synthetic Pollutants in the North Sea, W79-02470 5C

NON-STRUCTURAL ALTERNATIVES

A Non-Linear Programming Approach to Floodplain Management with Non-Structural Alternatives, W79-02400 6F

NONPENETRATING WELLS

Transient Spherical Flow to a Nonpenetrating Well with Constant Drawdown, W79-02191 4B

NONPOINT POLLUTION

Best Management Practices to Control Nonpoint-Source Pollution from Agriculture, W79-02233 5G

NONPOINT WATER POLLUTION SOURCES

A Systematic Procedure for Taxing Agricultural Pollution Sources, W79-02219 5G

NONRENEWABLE RESOURCES

The Long-Run Movement of the Prices of Exhaustible Resources, W79-02026 6C

Costly Innovation and Natural Resources, W79-02062 6B

Some Extensions of the Economic Theory of Exhaustible Resources, W79-02064 6B

NORTH AMERICA

The Distribution of Juncus Roemerianus in the Salt Marshes of North America, W79-02093 2L

NORTH DAKOTA

Diurnal Use of Small Wetlands by Ducks, W79-02418 2I

NORTH SEA

A Budget of Nitrogen Recycling in North Sea Sediments off the Belgian Coast, W79-02245 5C

Net-And Nanoplankton: Effects of an Oil Spill in the North Sea, W79-02467 5C

The Nutrient Contents of North Sea Water: Changes in Recent Years, Particularly in the Southern Bight, W79-02468 5B

A Model of the Biological Effects of Eutrophication in the North Sea, W79-02469 5C

A Method of Predicting the Biological Effects of Synthetic Pollutants in the North Sea, W79-02470 5C

NORWAY

Organchlorines in Codfish from Harbours Along the Norwegian Coast, W79-02479 5C

NUISANCE ALGAE

The Role of Silica and the Vernal Diatom Bloom in Controlling the Growth of Nuisance Algal Populations in Lakes, W79-02152 5C

NUTRIENT BUDGETS

A Budget of Nitrogen Recycling in North Sea Sediments off the Belgian Coast, W79-02245 5C

NUTRIENT CYCLING

Nutrients in Subsurface and Runoff Waters of the Holland Marsh, Ontario, W79-02428 5C

NUTRIENT FLUX

Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater, W79-02235 5C

NUTRIENT REMOVAL

Storm Derived Losses of Phosphorus and their Significance to Annual Phosphorus Export from Two New Jersey Watersheds, W79-02151 5B

Interstital Water Chemistry of Anoxic Long Island Sound Sediments. 2. Nutrient Regeneration and Phosphate Removal, W79-02243 5C

Treatment of High Strength Meatpacking Plant Wastewater by Land Application, W79-02301 5D

Effect of Dissolved Oxygen and Redox Potential and Nitrate Removal in Flooded Swamp and Marsh Soils, W79-02426 5C

NUTRIENT REQUIREMENTS

Winery Wastewater Characteristics and Treatment, W79-02297 5D

NUTRIENTS

Effects of Nitrate Concentration on the Growth and Physiology of Lominaria Saccharina (Phaeophyta) in Culture, W79-02010 5C

Ammonium Effects on Nutrient Cation Absorption by Wheat, W79-02021 3F

You Can Tailor Effluent BOD to Fit the Receiving-Water Ecosystem...and Enhance the Environment. Urban and Fish-Processing Wastes in the Marine Environment: Bioenhancement Studies at Terminal Island, California, W79-02164 5E

Seasonal Fluctuation of Water Quality (Nutrients and Pigments) in Lower Delaware Bay, W79-02223 5C

Kinetics of Algal Transient Phosphate Uptake and the Cell Quota Concept, W79-02237 5C

Cypress Wetlands for Water Management, Recycling and Conservation (Third Annual Report, November 1, 1975 to December 15, 1976), W79-02256 2I

Denitrification and Surface Runoff in the Experimental Domes: Cypress Wetlands, W79-02270 5C

Rates of Growth and Nutrient Concentrations of Trees in Cypress Domes, W79-02271 5C

Ability of Salt Marshes to Remove Nutrients and Heavy Metals from Dredged Material Disposa Area Effluents, W79-02347 5E

The Nutrient Contents of North Sea Water: Changes in Recent Years, Particularly in the Southern Bight, W79-02468 5B

NUTRIENTS

A Model of the Biological Effects of Eutrophication in the North Sea,
W79-02469 5C

Fish Farms are Having to Watch Their Waste.
W79-02474 5G

OBSTACLES TO MODELING
Planning and Modeling in Urban Water Management,
W79-02288 6B

OCEANS
Seiches in the Baltic Sea and Their Effect on Floods in the Neva River Delta,
W79-02213 2L

Quantitative Mapping by Remote Sensing of an Ocean Acid-Waste Dump,
W79-02407 5A

OHIO
Limnology of Selected Lakes in Ohio - 1975,
W79-02126 2H

Chemical Characterization of Local and Stratospheric Plutonium in Ohio Soils,
W79-02320 5A

Aquatic Disposal Field Investigations, Ashtabula River Disposal Site, Ohio; Appendix A: Planktonic Communities, Benthic Assemblages, and Fishery,
W79-02346 5E

OIL
The Effects of Petroleum on the Salt Marsh Ecosystem,
W79-02485 5C

OIL FIELDS
Origins of Water and Solutes in the Geopressured Zones of the Northern Gulf of Mexico Basin,
W79-02131 2K

OIL INDUSTRY
The Price of Natural Resources,
W79-02045 6C

Underground Injection Control Program Studied,
W79-02184 5G

Planning for Offshore Oil Development. Gulf of Alaska OCS Handbook,
W79-02198 5G

OIL POLLUTION
Oil Sorbing Mat,
W79-02309 5G

Oil Salvager,
W79-02315 5G

Compositions and Processes for the Dispersing of Oil Spillages,
W79-02325 5G

Filration System,
W79-02332 5D

Gravitational Separator for Mixtures of Immiscible Liquids of Different Densities,
W79-02336 5D

Device for the Removal of a Liquid Layer on Water,
W79-02337 5G

Apparatus for Collecting Effluent Oil,
W79-02339 5G

OIL RESERVOIRS
Improved Techniques for Evaluating Carbonate Waterfloods in West Texas,
W79-02182 4B

OIL SHALES
Establishment of Native Plants for the Rehabilitation of Paraho Processed Oil Shale in an Arid Environment,
W79-02391 4A

Analysis of the Environmental Control Technology for Oil Shale Development,
W79-02432 5G

OIL SPILLS
Oil Sorbing Mat,
W79-02309 5G

Oil Salvager,
W79-02315 5G

Compositions and Processes for the Dispersing of Oil Spillages,
W79-02325 5G

Apparatus for Collecting Effluent Oil,
W79-02339 5G

Net-And Nanoplankton: Effects of an Oil Spill in the North Sea,
W79-02467 5C

The Urquiola Oil Spill, La Coruna, Spain: Impact and Reaction on Beaches and Rocky Coasts,
W79-02500 5C

OIL WASTES
Assessment of Hazardous Waste Practices in the Petroleum Refining Industry,
W79-02440 5D

OIL WELLS
Effect of Barite (BASO4) on Development of Estuarine Communities,
W79-02484 5C

OLIGOTROPHY
Maximum Depth Inhabited by Aquatic Vascular Plants,
W79-02249 5C

ON-SITE INVESTIGATIONS
Procedure for the Evaluation of Environmental Monitoring Laboratories,
W79-02149 5A

ONTARIO
Water Level Fluctuation in a Northeastern Ontario Peatland,
W79-02105 2H

OPERATION AND MAINTENANCE
Operation of the (Effluent) Purification Equipment at the Razlog Pulp and Paper Mill (Opit ot rabota na prechisvatelnata stantsiya kem KTsKh Razlog),
W79-02367 5D

OPTIMAL COOLING SYSTEMS
Optimal Configuration of the Cooling System for Power Generation,
W79-02081 5G

OPTIMIZATION
Growth and Optimal Growth with Renewable and Non Renewable Natural Resources,
W79-02032 6A

On the Optimal Policy for Exploiting Renewable Resource Stocks,
W79-02040 6B

Optimal and Competitive Use of Replenishable Natural Resources by Open Economies,
W79-02058 6C

Optimal Utilization and the Control of Fisheries,
W79-02065 6B

Optimization and Suboptimization in Fishery Regulation,
W79-02066 6B

Optimization and Suboptimization in Fishery Regulation: Comment,
W79-02067 6B

ORCHARDS
Drip Study Shows up to 30% Water Savings,
W79-02090 3F

ORGANIC COMPOUNDS
Partial Characterization of Chlorinated Organics in Superchlorinated Septages and Mixed Sludges,
W79-02413 5D

ORGANIC MATTER
Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater,
W79-02235 5C

The Uptake of Dissolved Organic Matter by a Small Spring Stream,
W79-02248 5C

Particulate and Dissolved Organic Matter in a Small Partly Forested Ontario Stream,
W79-02252 5C

Differential Effect of Bermuda and Bahiagrasses on Soil Chemical Characteristics,
W79-02381 3F

ORGANOCHLORINES
Further Data on Heavy Metals and Organochlorines in Marine Mammals from German Coastal Waters,
W79-02460 5B

Organchlorines in Codfish from Harbours Along the Norwegian Coast,
W79-02479 5C

ORGANOMETALLICS
Atomic Absorption Detector for Chromium Organometallic Compounds Separated by High Speed Liquid Chromatography,
W79-02080 5A

OSCILLAXANTHIN
Specific Blue-Green Algal Carotenoids in Sediments of Esthwaite Water,
W79-02246 5C

OSMOREGULATION
The Influence of Salinity and Temperature on Growth, Metabolism and Lethal Temperature of the Sand Goby, Pomatoschistus Microps K. (Der Einfluss Von Salzgehalt und Temperatur Auf Wachstum Stoffwechsel und Letaltemperatur Der Strandgrundel Pomatoschistus Microps K.),
W79-02466 5C

OSMOSIS
Evaluation of Semipermeable Membranes for Concentration or Organic Contaminants in Drinking Water,
W79-02405 5A

OSMOTIC PRESSURE
Evaluation of Semipermeable Membranes for Concentration or Organic Contaminants in Drinking Water,
W79-02405 5A

OUTER CONTINENTAL SHELF
Planning for Offshore Oil Development. Gulf of Alaska OCS Handbook,
W79-02198 5G

OVERDRAFT
Ground Water...California's Priceless Resource,
W79-02392 4B

OVERFLOW
Handling and Disposal of Sludges from Combined Sewer Overflow Treatment. Phase II - Impact Assessment,
W79-02303 5D

OVERWINTERING SITES
Telemetric Determination of Salmonid Winter Micro-Habitat Occupation and Movement in Ice-Covered Streams,
W79-02157 7B

OXIDATION
Ammonium Oxidation and its Significance in the Summer Cycling of Nitrogen in Oxygen Depleted Skan Bay, Unalaska Islanda, Alaska,
W79-02004 5C

Oxygen Transfer at Hydraulic Structures,
W79-02202 5G

Ozone Treatment of Cyanide-Bearing Plating Waste,
W79-02299 5D

Purification of Kraft Pulping Effluents by Electrochemical Oxidation (Ochistka stokov sul'fatno-tsellyuloznogo proizvodstva elektrokhimicheskim okisleniem),
W79-02380 5D

OXIDATION-REDUCTION POTENTIAL
Redox Potential Measurements as an Indication of Biochemical Well Plugging,
W79-02170 5A

Effect of Dissolved Oxygen and Redox Potential and Nitrate Removal in Flooded Swamp and Marsh Soils,
W79-02426 5C

OXYGEN DEMAND
Influence of Water Soluble Excreta on Oxygen Consumption of Tilapia Zillii,
W79-02462 5C

OXYGEN DEPLETION
Ammonium Oxidation and its Significance in the Summer Cycling of Nitrogen in Oxygen Depleted Skan Bay, Unalaska Islanda, Alaska,
W79-02004 5C

OXYGENATION
Studies on the Effects of the Environment on the Heart Rate of Shellfishes. II. Effects of Temperature, Low Salinity and Hypoxia on the Heart Rate of an Abalone Haliotis (Nordotis) Discus Hannai Ino. (In Japanese),
W79-02497 5C

OZONE
Ozone Treatment of Cyanide-Bearing Plating Waste,
W79-02299 5D

P-32 UPTAKE
P-32 Uptake in Lentic Algae,
W79-02078 5C

PACKER TESTS
A Note on Packer, Slug, and Recovery Tests in Unconfined Aquifers,
W79-02179 8G

PALEOHYDROLOGY
A Hydraulic Installation in the Water Supply System of Emmaus-Nicopolis,
W79-02394 4A

The Water Supply System of Caesarea Maritima,
W79-02399 8B

PALEOLIMNOLOGY
A Paleolimnological Comparison of Burntside and Shagawa Lakes, Northeastern Minnesota,
W79-02295 5C

PARATHION
Insecticide Persistence in Natural Seawater as Affected by Salinity, Temperature, and Sterility,
W79-02487 5B

PARTICLE SIZE
Gradient, Discharge, and Particle-Size Relations of Alluvial Channels in Kansas, With Observations on Braiding,
W79-02120 2J

A Contribution to the Lake Pleistocene Stratigraphy of the Susquehanna River Valley of New York,
W79-02135 2J

Particulate and Dissolved Organic Matter in a Small Partly Forested Ontario Stream,
W79-02252 5C

Splash and Discontinuous Runoff as Creators of Fine Sandy Lag Deposits with Kalahari Sands,
W79-02393 2J

PARTICLES
Particulate and Dissolved Organic Matter in a Small Partly Forested Ontario Stream,
W79-02252 5C

PARTICULATES
Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater,
W79-02235 5C

PASTURES
Range Cattle Impacts on Stream Water Quality in the Colorado Front Range,
W79-02386 5G

PATCHINESS
A Pattern Analysis of Clear Lake Phytoplankton,
W79-02227 5C

PATENTS
Full-Season Rain Gauge Having Replaceable Charts for Making Profile Graphs,
W79-02304 7B

Method and Apparatus for Removing Grit,
W79-02305 5D

Drive Device for Rake Arm with Attached Screen Comb in Cleaning Device for a Water Conduit Screen,
W79-02306 8C

Method of and Apparatus for Purifying Fluids with Radioactive Impurities,
W79-02307 5D

Water Purifier,
W79-02308 5F

Oil Sorbing Mat,
W79-02309 5G

Continuous Treatment of Liquid Effluent and Sewage,
W79-02310 5D

Separation of an Aqueous or Water-Miscible Liquid from a Fluid Mixture,
W79-02311 5D

Method of Clarifying Industrial Waste Water,
W79-02312 5D

Process for Reducing the Mercury Content of Industrial Waste Waters,
W79-02313 5D

Oil Salvager,
W79-02315 5G

Device for Measuring pH and Temperature of a Liquid, Which Includes a Memory,
W79-02316 5A

Fresh Water Supply and Waste Water Retention System,
W79-02317 5G

Reciprocable Sprinkler,
W79-02318 3F

Home Water Distiller,
W79-02319 5F

Method for Treating a Medium Containing Water with Coagulants,
W79-02322 5D

Process for the Preparation of a Substantially Homogeneous Lime Water solution,
W79-02323 5D

Method of Treating a Waste Liquid Containing Polluting Compounds,
W79-02324 5D

Compositions and Processes for the Dispersing of Oil Spillages,
W79-02325 5G

Drainage Device for Particulate Material,
W79-02326 5D

Liquid Level Control System for Separation Tank,
W79-02327 5D

Apparatus for Collecting Debris Floating in a Stream,
W79-02328 5G

Reverse Osmosis Water Unit,
W79-02329 5F

Flow Monitoring,
W79-02330 8G

Polyquaternary Compounds for the Control of Microbiological Growth,
W79-02331 5D

Filration System,
W79-02332 5D

Water Treatment Apparatus and Method,
W79-02333 5F

Process for Recovering Proteinaceous Matter from Acid Whey and Tannery Unhairing Effluents,
W79-02334 5D

Novel Compositions of Matter for Use in the Treatment of Aqueous Systems,
W79-02335 5F

Gravitational Separator for Mixtures of Immiscible Liquids of Different Densities,
W79-02336 5D

Device for the Removal of a Liquid Layer on Water,
W79-02337 5G

Desalination Reverse Osmotic Membranes and Their Preparation,
W79-02338 3A

Apparatus for Collecting Effluent Oil,
W79-02339 5G

Scanning Apparatus for Septic Effluents,
W79-02340 5D

Waste Water Reclamation Apparatus,
W79-02341 5D

Grease Separator,
W79-02342 5D

Waste Fluid Treatment System,
W79-02343 5D

PATH OF POLLUTANTS
Atmospheric Formation, Dispersion, and Deposition of Acid Substances,
W79-02015 5A

Water Quality in the Old Plantation Water Control District, Broward County, Florida-Progress Report, July 1976-June 1977,
W79-02127 5B

Mass Balance Determinations for Pollutants in Urban Regions. Methodology with Applications to Lead, Zinc, Cadmium, and Arsenic.
W79-02148 5A

Storm Derived Losses of Phosphorus and their Significance to Annual Phosphorus Export from Two New Jersey Watersheds,
W79-02151 5B

The Effects of Storm Events on the Annual Phosphorus Transport in Six-Mile Run,
W79-02153 5B

Proceedings of a Workshop on the Evaluation of Models Used for the Environmental Assessment of Radionuclide Releases.
W79-02434 5B

Virus Transport Through Solid Beds,
W79-02447 5B

Organochlorine and Mercury Residues in Fish from Lake Simcoe, Ontario 1970-76,
W79-02456 5B

Uptake, Retention and Loss of Cadmium by Brown Shrimp, (Crangon Crangon),
W79-02463 5B

PATTERN ANALYSIS
A Pattern Analysis of Clear Lake Phytoplankton,
W79-02227 5C

PAVING
Precipitation and Runoff Water Quality from an Urban Parking Lot and Implications for Tree Growth,
W79-02387 5B

Optimization and Testing of Highway Materials to Mitigate Ice Adhesion,
W79-02408 8G

PEAK DISCHARGE
Comparison of the Predictive Accuracy of Models of Urban Flow and Water-Quality Processes,
W79-02253 5B

PEAT
Minnesota's Peat Resources: Their Characteristics and Use in Sewage Treatment, Agriculture, and Energy,
W79-02255 5G

The Organic Sediments of Corkscrew Swamp Sanctuary,

PISCICIDES
Effect of Antimycin on Stream Insects in Field and Laboratory Trials,
W79-02156 5C

PLANKTIVORES
Trophic Structure Modifications by Planktivorous Fish in Aquatic Microcosms,
W79-02013 5C

PLANKTON
Organism Patchiness in Lakes Resulting from the Interaction Between the Internal Seiche and Planktonic Diurnal Vertical Migration,
W79-02009 5C

Aquatic Disposal Field Investigations, Ashtabula River Disposal Site, Ohio; Appendix A: Planktonic Communities, Benthic Assemblages, and Fishery,
W79-02346 5E

Influence of Silver Carp (Hypophtalmichthys Molitrix) on Plankton of Shallow Waters According to Investigations in Carp Ponds (Wirkungen Von Silberkarpfen (Hypophthalmichtmys Molitrix) Auf Das Plankton in Flachcewassern Nach Untersuchungen in Karpfenteichen),
W79-02457 5C

The Crustacean Zooplankton of Grasmere Before and After a Change in Sewage Effluent Treatment,
W79-02458 5C

PLANNING
Quantification, Decision-Making and Environmental Impact Assessment in the United Kingdom.
W79-02028 6G

Coordinating Public Utility Expansion, Industrial Siting and Pollution Control: A Working Dynamic Programming Algorithm,
W79-02039 5G

Issues in Water Development Decisions: A Discussion Paper,
W79-02042 6B

Forested Wetlands of Florida-Their Management and Use,
W79-02112 6B

Geographic Aspects of the Territorial Redistribution of Water Resources,
W79-02209 4A

Profile and Measurement of Social Well-Being Indicators for Use in the Evaluation of Water and Related Land Management Planning,
W79-02344 6B

PLANT BIOCHEMISTRY
Ethylmercury: Formation in Plant Tissues and Relation to Methylmercury Formation,
W79-02488 5A

PLANT ECOLOGY
The Autecology of Sawgrass in the Florida Everglades,
W79-02104 2L

PLANT GROWTH
Effects of Nitrate Concentration on the Growth and Physiology of Lominaria Saccharina (Phaeophyta) in Culture,
W79-02010 5C

The Nature of Growth Forms in the Salt Marsh Grass Spartina Alterniflora,
W79-02087 2L

Dependence of Light-Saturated Rates of Algal Photosynthesis on Intracellular Concentrations of Phosphorus,
W79-02236 5C

Rates of Growth and Nutrient Concentrations of Trees in Cypress Domes,
W79-02271 5C

Growth Rates of Seedlings Planted in Cypress Domes,
W79-02272 5C

Effect of Sewage Effluent in Cypress Ponds on Surrounding Soil Moisture and Nutrient Content and on Growth of Pine Trees (Summary of MS Thesis),
W79-02273 5C

Effect of Sewage Effluent in Cypress Ponds on Growth of Surrounding Pine Seedlings and Trees,
W79-02274 5C

PLANT GROWTH SUBSTANCES
Growth-Influencing Substances in Sediment Extracts from a Subtropical Wetland: Investigation Using a Diatom Bioassay,
W79-02476 5C

PLANT MORPHOLOGY
Biochemical and Transpiration Studies of the Growth Form of Spartina Alterniflora on Connecticut Salt Marshes,
W79-02101 2I

PLANT PHYSIOLOGY
Effects of Nitrate Concentration on the Growth and Physiology of Lominaria Saccharina (Phaeophyta) in Culture,
W79-02010 5C

Physiological Aspects of Water Use Efficiency,
W79-02449 2I

Ethylmercury: Formation in Plant Tissues and Relation to Methylmercury Formation,
W79-02488 5A

PLANT POPULATIONS
The Vegetation of Southern Florida,
W79-02425 2I

PLANTATION CANAL (VA)
Water Quality in the Old Plantation Water Control District, Broward County, Florida-Progress Report, July 1976-June 1977,
W79-02127 5B

PLASTIC PIPES
Drillers Find Increasing Use for Plastic Pipe,
W79-02177 8G

PLEISTOCENE EPOCH
Hula Valley Peat: Review of Chemical and Geochemical Aspects,
W79-02365 2K

PLUTONIUM
Anion Exchange Method for the Determination of Plutonium in Water: Single-Laboratory Evaluation and Interlaboratory Collaborative Study,
W79-02145 5A

Chemical Characterization of Local and Stratospheric Plutonium in Ohio Soils,
W79-02320 5A

PODZOLS
The Behavio of Sulfate on Salt Input in Podzolic Brown Earth,
W79-02321 2K

POISSON-BOLTZMANN EQUATION
Application of the Electrical Double Layer Theory to Predict Ion Absorption in Mixed Ionic Systems,
W79-02314 2K

POLECAT BAY (ALA)
Perimeter Dike Raising with Dewatered Fine-Grained Dredged Material at Upper Polecat Bay Disposal Area, Mobile, Alabama,
W79-02345 5E

POLICY
A Simulation Model for Resource Policy Evaluation,
W79-02025 6A

On the Optimal Policy for Exploiting Renewable Resource Stocks,
W79-02040 6B

POLIOVIRUS TYPE I
Adsorption of Poliovirus Type I to Wastewater Treatment Plant Solids,
W79-02446 5D

POLITICAL ASPECTS
Nine Fallacies of Natural Disaster: The Case of the Sahel,
W79-02398 6B

POLITICAL CONSTRAINTS
The Price of Natural Resources,
W79-02045 6C

POLLUTANT IDENTIFICATION
Measurement of Chelating Agent Levels in Media with High Concentrations of Interfering Metal Ions,
W79-02079 5A

Atomic Absorption Detector for Chromium Organometallic Compounds Separated by High Speed Liquid Chromatography,
W79-02080 5A

Anion Exchange Method for the Determination of Plutonium in Water: Single-Laboratory Evaluation and Interlaboratory Collaborative Study,

PULP AND PAPER INDUSTRY
Natural Resources and Regional Disparities: A Skeptical View,
W79-02034 6B

Econometric Analysis of Environmental Policy: Estimation of a Model of the Canadian Pulp and Paper Industry,
W79-02046 6B

Possibilities and Measures in the Pulp Industry in the Interest of Environmental Protection (Moeglichkeiten und Massnahmen der Zellstoffindustrie im Interesse des Umweltschutzes).
W79-02369 5G

Pulp Industry and Water Pollution Control (Zellstoffindustrie und Gewaesserschutz),
W79-02370 5G

Possibilities for Reducing COD and 5-Day BOD in Waste Waters from the Pulp and Viscose Rayon Fiber Industries (Moeglichkeiten zur Reduktion des CSB und BSB(5) in den Abwaessern der Zellstoff- und Viskosefaserindustrie),
W79-02376 5D

Status and Methods for Effluent Purification in Pulp and Paper Mills (Stand und Verfahren der Restabwasserreinigung von Zellstoff- und Papierfabriken),
W79-02377 5D

PULP AND PAPER MILL SLUDGE
Bark as a Medium for Gravity Dewatering of Secondary Sludge from Pulp and Paper Mills,
W79-02186 5D

PULP WASTES
New Pulp Mill Strikes Low Profile.
W79-02102 5D

Investigations of Heat Treatment for Paper Mill Sludge Conditioning,
W79-02296 5E

Planning and Startup of a Flexible Activated Sludge Installation (Bioflex Process) as a Biological Clarification Stage in a Board Mill (Planung und Inbetriebnahme einer flexiblen Belebtschlammanlage (Bioflex-Verfahren) als biologische Klaerstufe einer Kartonfabrik),
W79-02361 5D

Screening -- A Novel Approach to Primary Treatment,
W79-02363 5D

Operation of the (Effluent) Purification Equipment at the Razlog Pulp and Paper Mill (Opit ot rabota na prechisvatelnata stantsiya kem KTsKh Razlog),
W79-02367 5D

Use of the Activated Sludge Process in Purifying Waste Waters from Pulp Production, Especially Kraft Pulp Production (Anwendung des Belebtschlammverfahrens zur Reinigung von Abwaessern aus der Zellstoffproduktion, insbesondere der Sulfatzellstoffproduktion),
W79-02371 5D

Purification of Effluents of the Verkhotursk Wood Chemical Plant in Storage Ponds (Ochistka stochnykh vod Verkhoturskogo Lesokhimicheskogo Zavoda v prudu-nakopitele),
W79-02372 5D

Processing of Pulp and Paper Industry Waste by Reverse Osmosis for Pollution Control,
W79-02373 5D

Fish Test With Golden Orfe -- Testing the Toxicity of Matter Contained in Water (Fischtest mit Goldorfen -- Pruefung der Toxizitaet von Wasserinhaltsstoffen),
W79-02375 5C

Sulfate Turpentine in Unpurified and Purified Effluents from the Baikal Pulp Mill (Sul'fatnyi skipidar v neochishchennykh i ochishchennykh stokakh Baikal'skogo Tsellyuloznogo Zavoda),
W79-02378 5B

Conversion of Lignosulfonates in Natural Waters (Prevrashchenie lignosul'fonatov v prirodnykh vodakh),
W79-02379 5B

Purification of Kraft Pulping Effluents by Electrochemical Oxidation (Ochistka stokov sul'fatno-tsellyuloznogo proizvodstva elektrokhimicheskim okisleniem),
W79-02380 5D

Analyses of Paper Machine Waters with Ion Specific Electrodes. Part V. Sulfide Determination Using Ag(+) Ion Specific Electrode and Various Measurement Methods,
W79-02388 5A

PUMPING
Transient Spherical Flow to a Nonpenetrating Well with Constant Drawdown,
W79-02191 4B

PUMPS
Water Systems Basics, (1),
W79-02180 8C

RACCOON
Food Habits of Coastal Marsh Raccoons with Observations of Alligator Nest Predation,

ROOTED AQUATIC PLANTS
Geographic Variations in Salt Marsh Macrophyte Productions: A Review,
W79-02098 2H

Biochemical and Transpiration Studies of the Growth Form of Spartina Alterniflora on Connecticut Salt Marshes,
W79-02101 2I

Primary Production in a Shallow Water Lake with Special Reference to a Reed Swamp,
W79-02103 5C

The Autecology of Sawgrass in the Florida Everglades,
W79-02104 2L

Maximum Depth Inhabited by Aquatic Vascular Plants,
W79-02249 5C

RUBBER
Optimization and Testing of Highway Materials to Mitigate Ice Adhesion,
W79-02408 8G

RUNOFF
Role of Ground Waters in the Formation of the Total Runoff of a Small Drainage Basin in the Forest Zone,
W79-02211 4B

RURAL AREAS
Management of Rural Water Supply Peak Flow Rates,
W79-02194 3D

SAHEL
Nine Fallacies of Natural Disaster: The Case of the Sahel,
W79-02398 6B

SALINE SOILS
Sugar Cane Growth in Response to Mulch and Fertilizer on Saline-Alkali Subsoils,
W79-02029 3C

SALINE WATER
Water Quality Can Affect Management Planning,
W79-02096 5G

SALINE WATER SYSTEMS
Hypersaline Lagoonal Deposits and Processes,
W79-02430 2L

SALINITY
Alligator Diets in Relation to Marsh Salinity, W79-02118 2L

Effects of Some Environmental Factors on Growth and Food Consumption of the Baltic Palaemonid Shrimp, Palaemon Adspersus Var. Fabricii (Rathke), W79-02465 5C

The Influence of Salinity and Temperature on Growth, Metabolism and Lethal Temperature of the Sand Goby, Pomatoschistus Microps K. (Der Einfluss Von Salzgehalt und Temperatur Auf Wachstum Stoffwechsel und Letaltemperatur Der Strandgrundel Pomatoschistus Microps K.), W79-02466 5C

Studies on the Effects of the Environment on the Heart Rate of Shellfishes. II. Effects of Temperature, Low Salinity and Hypoxia on the Heart Rate of an Abalone Haliotis (Nordotis) Discus Hannai Ino. (In Japanese), W79-02497 5C

SALMONIDS
Telemetric Determination of Salmonid Winter Micro-Habitat Occupation and Movement in Ice-Covered Streams, W79-02157 7B

On the Uptake of Three Different Types of Hydrocarbons by Salmon Eggs (Salmo Salar L.), W79-02464 5C

SALT
Water Quality Can Affect Management Planning, W79-02096 5G

SALT MARSHES
Amino Acids in Salt Marsh Detritus, W79-02086 5C

The Nature of Growth Forms in the Salt Marsh Grass Spartina Alterniflora, W79-02087 2L

The Distribution of Juncus Roemerianus in the Salt Marshes of North America, W79-02093 2L

Biochemical and Transpiration Studies of the Growth Form of Spartina Alterniflora on Connecticut Salt Marshes, W79-02101 2I

Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater, W79-02235 5C

Ability of Salt Marshes to Remove Nutrients and Heavy Metals from Dredged Material Disposa Area Effluents, W79-02347 5E

Effects of an Organic Arsenical Herbicide on a Salt Marsh Ecosystem, W79-02427 5C

The Effects of Petroleum on the Salt Marsh Ecosystem, W79-02485 5C

SALTS
The Behavio of Sulfate on Salt Input in Podzolic Brown Earth, W79-02321 2K

SALVINIA MOLESTA
The Colonization of Cabora Bassa, Mocambique, A New Man-Made Lake, by Floating Aquatic Macrophytes, W79-02231 4A

SAMPLING
Macroinvertebrate Sampling Techniques For Streams in Semi-Arid Regions: Comparison of the Surber Method and A Unit-Effort Traveling Kick Method, W79-02146 5A

SAN BERNADINO (CALIF)
Model Aids Planners in Predicting Rising Ground-Water Levels in San Bernadino, California, W79-02173 4B

SAN JOAQUIN VALLEY (CALIF)
The Occurrence and Removal of Nitrogen in Subsurface Agricultural Drainage from the San Joaquin Valley, California, W79-02107 5G

SAND AQUIFERS
Potential for Downward Leakage to the Floridan Aquifer, Green Swamp Area, Central Florida, W79-02136 7C

SAND GOBIES
The Influence of Salinity and Temperature on Growth, Metabolism and Lethal Temperature of the Sand Goby, Pomatoschistus Microps K. (Der Einfluss Von Salzgehalt und Temperatur Auf Wachstum Stoffwechsel und Letaltemperatur Der Strandgrundel Pomatoschistus Microps K.), W79-02466 5C

SARDIS RESERVOIR (MISS)
Trace Element of the Sardis Reservoir, Mississippi, as Related to Clay Mineral Dispersion, W79-02187 2H

SATURATED FLOW
Streaming-Potential Effects in Saturated Water Flow Through a Sand-Kaolinite Mixture, W79-02160 2G

Electrical Potentials During Water Entry into an Air-Dry Mixture of Sand and Kaolinite, W79-02357 2G

SATURATED THICKNESS
The Blind Zone in Seismic Ground-Water Exploration, W79-02190 4B

SAUDI ARABIA
An Evaluation of Isotope Concentrations in the Ground Water of Saudi Arabia, W79-02254 2F

SAWGRASS
The Autecology of Sawgrass in the Florida Everglades, W79-02104 2L

SAWYER BEND (MO-ILL)
Shoaling Conditions in Sawyer Bend and Lower Entrance to Chain of Rocks Canal, Mississippi River; Hydraulic Model Investigation, W79-02354 8B

SCALINE
Novel Compositions of Matter for Use in the Treatment of Aqueous Systems, W79-02335 5F

SCARCITY
Urban Water: Access, Delivery and Institutional Scarcity, W79-02036 6E

Implications of Alternative Measures of Natural Resource Scarcity, W79-02049 6B

Measuring Natural Resources Scarcity: Theory and Practice, W79-02059 6B

SCARCITY INDICES
Measuring Natural Resources Scarcity: Theory and Practice, W79-02059 6B

SCREENS
Drive Device for Rake Arm with Attached Screen Comb in Cleaning Device for a Water Conduit Screen, W79-02306 8C

Screening -- A Novel Approach to Primary Treatment, W79-02363 5D

SEA GRASSES
Distribution of Surficial Sediments and Eelgrass in New York's South Shore Bays: An Assessment from the Literature, W79-02162 2L

SEA WATER
Systematic Absorbance Errors with Technicon AutoAnalyzer II Colorimeters, W79-02074 2K

Photosynthetic Rates of Marine Algae as a Function of Inorganic Carbon Concentration, W79-02224 5C

SEASONAL
Seasonal Fluctuation of Water Quality (Nutrients and Pigments) in Lower Delaware Bay, W79-02223 5C

Seasonal Changes in the Epiphyte Community of Natural and Artificial Macrophytes in Lake Memphremagog (QUE. and VT.), W79-02232 5C

SECONDARY SLUDGE
Bark as a Medium for Gravity Dewatering of Secondary Sludge from Pulp and Paper Mills, W79-02186 5D

SECONDARY SLUDGE DEWATERING
Bark as a Medium for Gravity Dewatering of Secondary Sludge from Pulp and Paper Mills, W79-02186 5D

SEDIMENT CONTROL
Controlling Sediment in Surface Runoff, W79-02097 3F

Consequences of Site Disturbances in the Upper Coastal Plain, W79-02431 4D

SEDIMENT DISTRIBUTION
Distribution of Surficial Sediments and Eelgrass in New York's South Shore Bays: An Assessment from the Literature, W79-02162 2L

Trace Element of the Sardis Reservoir, Mississippi, as Related to Clay Mineral Dispersion W79-02187 2H

SEDIMENT TRANSPORT
A Contribution to the Lake Pleistocene Stratigraphy of the Susquehanna River Valley of New York, W79-02135 2

Transportation and Accumulation of Fine Grained Sediments in the Estuarine Environment: Recommendations for Research, W79-02165 2L

Flume Experiments on Sand, Silt, and Clay Mixtures from the Offshore Dredged Material Disposal Site, Galveston, Texas, W79-02348 5I

Shoaling Conditions in Sawyer Bend and Lower Entrance to Chain of Rocks Canal, Mississippi River; Hydraulic Model Investigation,
W79-02354 8B

Splash and Discontinuous Runoff as Creators of Fine Sandy Lag Deposits with Kalahari Sands,
W79-02393 2J

SEDIMENT-WATER INTERFACES
A Material Balance Study of Polychlorinated Biphenyls in Lake Michigan,
W79-02017 5C

The Distribution and Form of Phosphorus in North Atlantic Ocean Deep-Sea and Continental Slope Sediments,
W79-02230 5B

SEDIMENTARY BASINS (GEOLOGIC)
Fossil Ground-Water Gradients in Arid Regional Sedimentary Basins,
W79-02189 2F

SEDIMENTARY SOILS
Water Quality of Streamflow from Forested Watersheds on Sedimentary Soils,
W79-02404 5B

SEDIMENTARY STRUCTURES
Subsurface Geological Investigation of a Pleistocene Braided Stream in the Northern Coastal Plain, Delaware (U.S.A.),
W79-02167 2J

SEDIMENTATION
Sedimentation in Hot Creek in Vicinity of Hot Creek Fish Hatchery, Mono County, California,
W79-02128 2J

Wind Induced Dispersion and Algal Growth in Shallow Lakes,
W79-02226 5G

SEDIMENTATION RATES
Role of Inorganic Ions in Controlling Sedimentation Rate of a Marine Centric Diatom Ditylum Brightwelli,
W79-02014 5C

Sedimentation Rates: Cypress Domes,
W79-02275 5C

SEDIMENTOLOGY
Investigation of Matrix Interferences for AAS Trace Metal Analyses of Sediments,
W79-02143 5A

SEDIMENTS
Controlling Sediment in Surface Runoff,
W79-02097 3F

Intertidal Environment of Northern Dublin Bay,
W79-02204 5B

The Distribution and Form of Phosphorus in North Atlantic Ocean Deep-Sea and Continental Slope Sediments,
W79-02230 5B

Interstital Water Chemistry of Anoxic Long Island Sound Sediments. 2. Nutrient Regeneration and Phosphate Removal,
W79-02243 5C

A Budget of Nitrogen Recycling in North Sea Sediments off the Belgian Coast,
W79-02245 5C

SEICHES
Organism Patchiness in Lakes Resulting from the Interaction Between the Internal Seiche and Planktonic Diurnal Vertical Migration,
W79-02009 5C

Seiches in the Baltic Sea and Their Effect on Floods in the Neva River Delta,
W79-02213 2L

SEISMIC DESIGN
Liquefaction Potential of Hydraulic Fills,
W79-02203 8D

SEISMIC REFRACTION
Geophysical Delineation of Buried Glacial River Valley Aquifers in Grundy County, Missouri,
W79-02154 2F

The Blind Zone in Seismic Ground-Water Exploration,
W79-02190 4B

SEISMIC STUDIES
The Blind Zone in Seismic Ground-Water Exploration,
W79-02190 4B

SELF-PURIFICATION
The Uptake of Dissolved Organic Matter by a Small Spring Stream,
W79-02248 5C

SEMIPERMEABLE MEMBRANES
Evaluation of Semipermeable Membranes for Concentration or Organic Contaminants in Drinking Water,
W79-02405 5A

SENSIBLE HEAT
The Micro-Climate of Narrow- and Wide-Row Sorghum With Equal Plant Densities,
W79-02358 2D

SEPARATION TECHNIQUES
Ozone Treatment of Cyanide-Bearing Plating Waste,
W79-02299 5D

SETTLEMENT
Acid Mine Drainage and Subsidence: Effects of Increased Coal Utilization,
W79-02409 5G

SETTLING BASINS
Fish Farms are Having to Watch Their Waste.
W79-02474 5G

SEWAGE DISPOSAL
Handling and Disposal of Sludges from Combined Sewer Overflow Treatment. Phase II - Impact Assessment,
W79-02303 5D

SEWAGE EFFLUENTS
Studies of the Ecology of Fish Populations in the Rye Meads Sewage Effluent Lagoons,
W79-02454 5C

The Crustacean Zooplankton of Grasmere Before and After a Change in Sewage Effluent Treatment,
W79-02458 5C

SEWAGE LAGOONS
Studies of the Ecology of Fish Populations in the Rye Meads Sewage Effluent Lagoons,
W79-02454 5C

SEWAGE TREATMENT
Minnesota's Peat Resources: Their Characteristics and Use in Sewage Treatment, Agriculture, and Energy,
W79-02255 5G

Handling and Disposal of Sludges from Combined Sewer Overflow Treatment. Phase II - Impact Assessment,
W79-02303 5D

Method and Apparatus for Removing Grit,
W79-02305 5D

Continuous Treatment of Liquid Effluent and Sewage,
W79-02310 5D

The Crustacean Zooplankton of Grasmere Before and After a Change in Sewage Effluent Treatment,
W79-02458 5C

SEWERS
Advances in Storm and Combined Sewer Pollution Control Abatement Technology,
W79-02437 5D

Storm and Combined Sewer Pollution Control Program Reports. Research, Development, and Demonstration Grant, Contract, and In-House Project Reports.
W79-02442 5G

SHAGAWA LAKE (MN)
A Paleolimnological Comparison of Burntside and Shagawa Lakes, Northeastern Minnesota,
W79-02295 5C

SHAPE
Physical Properties of Icebergs, Part I--Height to Draft Ratios of Icebergs, Part II--Mass Estimation of Arctic Icebergs,
W79-02216 2C

SHEER STRESS
Practical Riprap Design,
W79-02351 8B

SHELLFISH
Proceedings of the Interstate Seafood Seminar October 4-7, 1977.
W79-02163 5G

SHIELD'S DESIGN
Practical Riprap Design,
W79-02351 8B

SHOALING
Shoaling Conditions in Sawyer Bend and Lower Entrance to Chain of Rocks Canal, Mississippi River; Hydraulic Model Investigation,
W79-02354 8B

SHORE PROTECTION
Tire Module Systems in Shore and Harbor Protection,
W79-02201 8G

SHRIMP
Possible Toxic Effects of the Marine Blue-Green Alga, Spirulina Subsalsa, on the Blue Shrimp, Penaeus Stylirostris,
W79-02459 5C

Uptake, Retention and Loss of Cadmium by Brown Shrimp, (Crangon Crangon),
W79-02463 5B

Effects of Some Environmental Factors on Growth and Food Consumption of the Baltic Palaemonid Shrimp, Palaemon Adspersus Var. Fabricii (Rathke),
W79-02465 5C

SILICA
The Role of Silica and the Vernal Diatom Bloom in Controlling the Growth of Nuisance Algal Populations in Lakes,
W79-02152 5C

SILICATES
The Nutrient Contents of North Sea Water: Changes in Recent Years, Particularly in the Southern Bight,
W79-02468 5B

SILT-FENCE
The Effect of Silt-Fence on the Prevention of Sea Water Siltation Caused by Dredging and Reclaiming Work in Harbor, (In Japanese),
W79-02481 5C

SILTS
The Effect of Silt-Fence on the Prevention of Sea Water Siltation Caused by Dredging and Reclaiming Work in Harbor, (In Japanese),
W79-02481 5C

SIMULATION ANALYSIS
A Dynamic Lake Model for Trophic State Prediction,
W79-02006 5C

Examination of a Lake Model,
W79-02007 5C

A Simulation Model for Phytoplankton Growth and Nutrient Cycling in Eutrophic, Shallow Lakes,
W79-02008 5C

Application of a Model of Zooplankton Composition to Problems of Fish Introductions to the Great Lakes,
W79-02020 5C

A Simulation Model for Resource Policy Evaluation,
W79-02025 6A

Some Comparisons of Flood Statistics in Real and Log Space,
W79-02119 2E

Computer Assisted Instruction in Natural Resource Management,
W79-02161 7C

Simulated Flow Through the Root Xylem,
W79-02199 2I

Simulation Model of Cryptomonas Ovata Population Dynamics in Southern Kootenay Lake, British Columbia,
W79-02225 5C

Physical Model Simulation of the Hydraulics of Masonboro Inlet, North Carolina,
W79-02353 8B

Brook: A Hydrologic Simulation Model for Eastern Forests,
W79-02448 4D

SITE PRODUCTIVITY
Consequences of Site Disturbances in the Upper Coastal Plain,
W79-02431 4D

SITES
Coordinating Public Utility Expansion, Industrial Siting and Pollution Control: A Working Dynamic Programming Algorithm,
W79-02039 5G

Is It Time to Do a Benefit-Cost Analysis for the Location of a Power Plant,
W79-02054 6B

SIX-MILE RUN (NJ)
The Effects of Storm Events on the Annual Phosphorus Transport in Six-Mile Run,
W79-02153 5B

SKAN BAY (AK)
Ammonium Oxidation and its Significance in the Summer Cycling of Nitrogen in Oxygen Depleted Skan Bay, Unalaska Islanda, Alaska,
W79-02004 5C

SLUDGE DEWATERING
Bark as a Medium for Gravity Dewatering of Secondary Sludge from Pulp and Paper Mills,
W79-02186 5D

SLUDGE DISPOSAL
Economic Evaluation of Four Sludge Dewatering Devices,
W79-02037 5D

Handling and Disposal of Sludges from Combined Sewer Overflow Treatment. Phase II - Impact Assessment,
W79-02303 5D

SLUDGE TREATMENT
Economic Evaluation of Four Sludge Dewatering Devices,
W79-02037 5D

Combination Limestone-Lime Neutralization of Ferrous Iron Acid Mine Drainage,
W79-02150 5D

Investigations of Heat Treatment for Paper Mill Sludge Conditioning,
W79-02296 5E

Experience with Drum Dryers for Activated Sludge (Opyt naladki barabannykh sushilok aktivnogo ila),
W79-02385 5E

Partial Characterization of Chlorinated Organics in Superchlorinated Septages and Mixed Sludges,
W79-02413 5D

SLUG TESTS
A Note on Packer, Slug, and Recovery Tests in Unconfined Aquifers,
W79-02179 8G

SMALL WATERSHEDS
Role of Ground Waters in the Formation of the Total Runoff of a Small Drainage Basin in the Forest Zone,
W79-02211 4B

SNOW STORAGE
Analysis of Error in the Determination of Snow Storage for Small High Arctic Basins,
W79-02197 2C

SNOW SURVEYS
Analysis of Error in the Determination of Snow Storage for Small High Arctic Basins,
W79-02197 2C

SNOWMELT RUNOFF
Pollutional Characteristics of Stormwater Runoff,
W79-02451 5B

SNOWPACKS
Analysis of Error in the Determination of Snow Storage for Small High Arctic Basins,
W79-02197 2C

SOCIAL ASPECTS
Profile and Measurement of Social Well-Being Indicators for Use in the Evaluation of Water and Related Land Management Planning,
W79-02344 6B

Nine Fallacies of Natural Disaster: The Case of the Sahel,
W79-02398 6B

SOCIAL WELL-BEING INDICATORS
Profile and Measurement of Social Well-Being Indicators for Use in the Evaluation of Water and Related Land Management Planning,
W79-02344 6B

SOIL ANALYSIS
Investigation of Matrix Interferences for AAS Trace Metal Analyses of Sediments,
W79-02143 5A

SOIL CHEMICAL PROPERTIES
Differential Effect of Bermuda and Bahiagrasses on Soil Chemical Characteristics,
W79-02381 3F

SOIL COLUMNS
Disappearance of Nitrate Under Transient Conditions in Columns of Soil,
W79-02122 2G

SOIL COLUMNS, NITRATE-NITROGEN
Reduction of Nitrate in a Soil Column During Continuous Flow,
W79-02366 2G

SOIL CONTAMINATION
Virus Transport Through Solid Beds,
W79-02447 5B

SOIL EROSION
A Computer Simulation of Phosphate and Nitrogen Transport by Water Runoff,
W79-02251 5B

Consequences of Site Disturbances in the Upper Coastal Plain,
W79-02431 4D

SOIL INVESTIGATIONS
Volatility of Mercury from Soils Amended with Various Mercury Compounds,
W79-02142 5B

SOIL MOISTURE
Effect of Sewage Effluent in Cypress Ponds on Surrounding Soil Moisture and Nutrient Content and on Growth of Pine Trees (Summary of MS Thesis),
W79-02273 5C

SOIL MOISTURE METER
Material Content of Binary Physical Mixture as Measured with a Dual-Energy Beam of Gamma Rays,
W79-02356 2G

SOIL PHYSICAL PROPERTIES
Consequences of Site Disturbances in the Upper Coastal Plain,
W79-02431 4D

SOIL TEMPERATURE
Yield Response to Soil Warming: Agronomic Crops,
W79-02490 3F

SOIL WATER
Growth and Yield of Spring Wheat as Influenced by Shelter and Soil Water,
W79-02035 3F

Plant Water Relationships of Spring Wheat as Influenced by Shelter and Soil Water,
W79-02043 3F

SOIL WATER MOVEMENT
Transpiration Effects on Leaching Fractions,
W79-02019 3C

SOIL-WATER-PLANT RELATIONSHIPS
Design and the Desert Environment: Landscape Architecture in the American Southwest.
W79-02389 3B

SOILS
Computation of Soil Freezing Depth in the Zone of Aeration,
W79-02215 2C

SOLUBILITY
Reaction Products and Solubility of Applied Zinc Compounds in Some Manitoba Soils,
W79-02362 2K

SOMERSET (NY)
Is It Time to Do a Benefit-Cost Analysis for the Location of a Power Plant,
W79-02054 6B

SONG BIRDS
Comparison of Fall Birds Present in a Natural Cypress Dome, and the Adjacent Pine Plantation,
W79-02280 5C

SORGHUM
The Micro-Climate of Narrow- and Wide-Row Sorghum With Equal Plant Densities,
W79-02358 2D

Physiological Aspects of Water Use Efficiency,
W79-02449 2I

SOUTH CAROLINA
Determination of Methylmercury in Fish of South Carolina,
W79-02478 5A

SOUTHWEST U.S.
Design and the Desert Environment: Landscape Architecture in the American Southwest,
W79-02389 3B

Water-Quality Monitoring in the American Urbanizing Southwest,
W79-02397 5B

SPAIN
The Urquiola Oil Spill, La Coruna, Spain: Impact and Reaction on Beaches and Rocky Coasts,
W79-02500 5C

SPARTINA ALTERNIFLORA
Biochemical and Transpiration Studies of the Growth Form of Spartina Alterniflora on Connecticut Salt Marshes,
W79-02101 2I

SPATIAL DISTRIBUTION
A Pattern Analysis of Clear Lake Phytoplankton,
W79-02227 5C

Soft-Shore Macrobenthos Along the South-West Coast of Wales,
W79-02240 5C

SPECIFIC YIELD
Ground Water...California's Priceless Resource,
W79-02392 4B

SPECTROPHOTOMETRY
Investigation of Matrix Interferences for AAS Trace Metal Analyses of Sediments,
W79-02143 5A

SPEWRELL DAM PROJECT (GA)
Measurement of Economic Uncertainty in Public Water Resource Development: An Extension,
W79-02050 6B

SPILLS
Hazardous Material Spills: A Documentation and Analysis of Historical Data,
W79-02411 5G

SPRINKLER IRRIGATION
Lawn Sprinkler Distribution Patterns,
W79-02155 3F

Reciprocable Sprinkler,
W79-02318 3F

Wind, Sprinkler Patterns, and System Design,
W79-02368 3F

SPRUCE RUN CREEKS (NJ)
Storm Derived Losses of Phosphorus and their Significance to Annual Phosphorus Export from Two New Jersey Watersheds,
W79-02151 5B

STABILITY
Stable Taxation Schemes in Regional Environmental Management,
W79-02051 5G

STABLE ISOTOPES
An Evaluation of Isotope Concentrations in the Ground Water of Saudi Arabia,
W79-02254 2F

STANDARDS
The Choice of Efficient Pollution Policies: Technology and Economics in the Control of Sulphur Dioxide,
W79-02038 5G

Pricing and Standards in the Control of Pollution,
W79-02057 5G

STAPLE THEORY
Natural Resources and Regional Disparities: A Skeptical View,
W79-02034 6B

STATE GOVERNMENTS
The Controversy Continues: State Ownership of Drill Rigs,
W79-02168 6E

STATISTICAL ANALYSIS
Management of Rural Water Supply Peak Flow Rates,
W79-02194 3D

STATISTICAL METHODS
A Statistical Evaluation of Some Columbia River Basalt Chemical Analysis,
W79-02433 5A

STATISTICAL MODELS
A Pattern Analysis of Clear Lake Phytoplankton,
W79-02227 5C

STEROIDS
The Effects of Polychlorinated Biphenyls on Plasma Steroid Levels and Hepatic Microsomal Enzymes in Fish,
W79-02453 5C

STOCHASTIC MODELS
Stochastic Modeling for Predicting Frequency Distribution of Stages in Thermal Lakes at Future Planning Horizons,
W79-02495 4A

STOCHASTIC PROCESSES
Some Comparisons of Flood Statistics in Real and Log Space,
W79-02119 2E

STORAGE
Analysis of Error in the Determination of Snow Storage for Small High Arctic Basins,
W79-02197 2C

STORAGE TANKS
Water Systems Basics, (2),
W79-02181 8C

STORM DRAINS
Storm and Combined Sewer Pollution Control Program Reports. Research, Development, and Demonstration Grant, Contract, and In-House Project Reports.
W79-02442 5G

STORM RUNOFF
Storm Derived Losses of Phosphorus and their Significance to Annual Phosphorus Export from Two New Jersey Watersheds,
W79-02151 5B

The Effects of Storm Events on the Annual Phosphorus Transport in Six-Mile Run,
W79-02153 5B

Precipitation and Runoff Water Quality from an Urban Parking Lot and Implications for Tree Growth,
W79-02387 5B

Advances in Storm and Combined Sewer Pollution Control Abatement Technology,
W79-02437 5D

Pollutional Characteristics of Stormwater Runoff,
W79-02451 5B

STORM WATER TREATMENT
Advances in Storm and Combined Sewer Pollution Control Abatement Technology,
W79-02437 5D

STRATIFIED DRIFT
A Contribution to the Lake Pleistocene Stratigraphy of the Susquehanna River Valley of New York,
W79-02135 2J

STRATIGRAPHY
A Contribution to the Lake Pleistocene Stratigraphy of the Susquehanna River Valley of New York,
W79-02135 2J

Subsurface Stratigraphy and Water Resources of Cass County, Indiana,
W79-02185 4B

Hydrology of the Austin Cary Control Dome,
W79-02260 5E

STREAMFLOW
Effects of Forest Workings on Streamflow and Water Quality (Part I),
W79-02005 5C

Flow Characteristics of Streams in Tutuila, American Samoa,
W79-02124 2E

Estimates of 7-Day, 10-Year Minimum Flows at Selected Stream Sites in Puerto Rico,
W79-02125 5B

Relationships Among Substrate, Flow, and Benthic Microalgal Pigment Density in the Mechums River, Virginia,
W79-02229 5C

Water Quality of Streamflow from Forested Watersheds on Sedimentary Soils,
W79-02404 5B

STREAMING POTENTIAL
Streaming-Potential Effects in Saturated Water Flow Through a Sand-Kaolinite Mixture,
W79-02160 2G

Electrical Potentials During Water Entry into an Air-Dry Mixture of Sand and Kaolinite,
W79-02357 2G

STREAMS
Aquatic Plant Management in Semi-Natural Streams: The Role of Marginal Vegetation,
W79-02012 5G

Drainage Map of Arizona Showing Perennial Streams and Some Important Wetlands,
W79-02121 7C

Sedimentation in Hot Creek in Vicinity of Hot Creek Fish Hatchery, Mono County, California,
W79-02128 2J

The Uptake of Dissolved Organic Matter by a Small Spring Stream,
W79-02248 5C

Particulate and Dissolved Organic Matter in a Small Partly Forested Ontario Stream,
W79-02252 5C

STRIP MINE LAKES
Preliminary Evaluation of Final Cut Lakes,
W79-02292 5G

STRIP MINES
Preliminary Evaluation of Final Cut Lakes,
W79-02292 5G

STRUCTURAL ANALYSIS
The Water Supply System of Caesarea Maritima,
W79-02399 8B

STRUCTURAL GEOLOGY
Study of River Meandering in the Search for Tectonic Structures (As Exemplified by the Middle Dniester Region),
W79-02205 8E

Holocene Faulting in the Western Grand Canyon, Arizona,
W79-02496 2J

SUBMERGED PLANTS
Maximum Depth Inhabited by Aquatic Vascular Plants,
W79-02249 5C

Production of Submerged Aquatic Plant Communities of Doodhadhari Lake Raipur, (M. P. India),
W79-02419 2I

SUBMERGENCE
Effects of Simulated Flooding on Alligator Eggs,
W79-02116 2L

SUBMERSIBLE PUMPS
Water Systems Basics, (2),
W79-02181 8C

SUBSIDENCE
Land Subsidence Due to Water Withdrawal in the Vicinity of Pecos, Texas,
W79-02396 4B

SUBSTRATES
Relationships Among Substrate, Flow, and Benthic Microalgal Pigment Density in the Mechums River, Virginia,
W79-02229 5C

AUTHOR INDEX

AGRON, N. A.
Hula Valley Peat: Review of Chemical and Geochemical Aspects,
W79-02365 2K

AKIYA, F.
Desalination Reverse Osmotic Membranes and Their Preparation,
W79-02338 3A

ALLEE, D.
Studying the Economics of a Waterway: A Critique of Studies of the McClellan-Kerr Arkansas River Navigation System,
W79-02052 6B

ALLEE, D. J.
Is It Time to Do a Benefit-Cost Analysis for the Location of a Power Plant,
W79-02054 6B

ALLINSON, J.
Coliform Monitoring of Waters Associated with the Cypress Dome Project,
W79-02268 5C

ALLUM, M. O.
A Survey of Phosphorus and Nitrogen Levels in Treated Municipal Wastewater,
W79-02003 5A

AMBERGER, A.
A Computer Simulation of Phosphate and Nitrogen Transport by Water Runoff,
W79-02251 5B

ANDERSEN, K. P.
A Model of the Biological Effects of Eutrophication in the North Sea,
W79-02469 5C

ANDERSON, F. O.
Primary Production in a Shallow Water Lake with Special Reference to a Reed Swamp,
W79-02103 5C

ANDERSON, L. G.
'The Relationship Between Firm and Fishery in Common Property Fisheries': Reply,
W79-02061 6B

ANDERSON, L. W. J.
Role of Inorganic Ions in Controlling Sedimentation Rate of a Marine Centric Diatom Ditylum Brightwelli,
W79-02014 5C

ANDERSON, W. B.
An Economic Approach to Water Supply Planning in Southeastern Virginia,
W79-02294 6B

ANDREWS, C. B.
The Impact of the Use of Heat Pumps on Groundwater Temperatures,
W79-02192 4B

ANGELL, C. A.
Supercooling of Water to -92 Degrees C Under Pressure,
W79-02494 2C

ANISIMOVA, M. I.
Purification of Kraft Pulping Effluents by Electrochemical Oxidation (Ochistka stokov sul'fatno-tsellyuloznogo proizvodstva elektrokhimicheskim okisleniem),
W79-02380 5D

ANTIE, D. A.
Effect of Dissolved Oxygen and Redox Potential and Nitrate Removal in Flooded Swamp and Marsh Soils,
W79-02426 5C

ARAI, S.
Desalination Reverse Osmotic Membranes and Their Preparation,
W79-02338 3A

ARDAKANI, M. S.
Reduction of Nitrate in a Soil Column During Continuous Flow,
W79-02366 2G

ARMSTRONG, J. M.
Tire Module Systems in Shore and Harbor Protection,
W79-02201 8G

ARMSTRONG, W. B.
Redox Potential Measurements as an Indication of Biochemical Well Plugging,
W79-02170 5A

ARRINGTON, J. R.
Waste Fluid Treatment System,
W79-02343 5D

ASARE, F.
A Statistical Evaluation of Some Columbia River Basalt Chemical Analysis,
W79-02433 5A

ASSEED, M.
Water Infiltration into Uniform and Stratified Soils I. Review and Use of an Approximate Theory,
W79-02492 2G

Water Infiltration into Uniform and Stratified Soils II. Experimental Evaluation of an Approximate Theory,
W79-02493 2G

AUSTERN, B. M.
Partial Characterization of Chlorinated Organics in Superchlorinated Septages and Mixed Sludges,
W79-02413 5D

AVERY, S. T.
Oxygen Transfer at Hydraulic Structures,
W79-02202 5G

AZIMOV, S. G.
Computation of the Concentration of Substances in Rivers and Canals,
W79-02206 5B

BABKIN, V. A.
Purification of Kraft Pulping Effluents by Electrochemical Oxidation (Ochistka stokov sul'fatno-tsellyuloznogo proizvodstva elektrokhimicheskim okisleniem),
W79-02380 5D

BAGUR, J. D.
Barrier Islands of the Atlantic and Gulf Coasts of the United States: An Annotated Bibliography,
W79-02113 2L

BARLOW, E. W. R.
Protein Production Rates by Algae Using Swine Manure as a Substrate,
W79-02489 5D

BARMAN, E. H. JR.
Aquatic Vascular Plants of Lake Apopka, Florida,
W79-02420 2I

BARTHELMES, D.
Influence of Silver Carp (Hypophtalmichthys Molitrix) on Plankton of Shallow Waters According to Investigations in Carp Ponds (Wirkungen Von Silberkarpfen (Hypophthalmichtmys Molitrix) Auf Das Plankton in Flachcewassern Nach Untersuchungen in Karpfenteichen),
W79-02457 5C

BATES, E. R.
Acid Mine Drainage and Subsidence: Effects of Increased Coal Utilization,
W79-02409 5G

BEATY, E. R.
Differential Effect of Bermuda and Bahiagrasses on Soil Chemical Characteristics,
W79-02381 3F

BEAUCHAMP, J. J.
Bioaccumulation Potential and Acute Toxicity of Synthetic Fuels Effluents in Freshwater Biota: Azaarenes,
W79-02241 5C

BEELAND, G. V.
Survey of Environmental Regulations Applying to Geothermal Exploration, Development, and Use,
W79-02410 5G

BEESE, F.
The Behavio of Sulfate on Salt Input in Podzolic Brown Earth,
W79-02321 2K

BEL'CHIKOV, V. A.
Forecast of the Flash Flood Hydrograph on the Ingoda River,
W79-02207 4A

BELSER, L. W.
Reduction of Nitrate in a Soil Column During Continuous Flow,
W79-02366 2G

BELYAKOV, V. B.
Instruments for Monitoring the Quality of Natural and Waste Waters,
W79-02214 5A

BELYAYEV, A. V.
Complex Relations Between the Hydrologic Budget of the Major Geographic Zones of the Earth,
W79-02208 2A

BENDER, D. F.
Comparison of Methods for the Determination of Total Available Residual Chlorine in Various Sample Matrices,
W79-02412 5A

BENNETT, E. R.
Pollutional Characteristics of Stormwater Runoff,
W79-02451 5B

BENNETT, J. M.
Physiological Aspects of Water Use Efficiency,
W79-02449 2I

BEPPLER, T. O.
Procedural Inconsistencies and Substantive Issues in the Federal Reserved Water Rights Doctrine. Case Note, United States v. Akin, 504 F.2d 115 (10th Cir. 1974),
W79-02084 6E

BERESKIN, F. P.
Grease Separator,
W79-02342 5D

BERGHOLZ, W. E. JR.
Land Use and Rights in Groundwater. Case Note, Alameda County Water District v. Niles Sand and Gravel Co., 37 Cal.App. 3d 924, 112 Cal.Rptr. 846 (Ct.App. 1974), cert. denied, U.S. 95 S.Ct. 128 (1974),
W79-02085 6E

BERK, S. G.
Effects of Ingesting Mercury-Containing Bacteria on Mercury Tolerance and Growth Rates of Ciliates,
W79-02499 5C

BERLING, R. L.
Disaster Response to Flash Flood,
W79-02193 8B

BERNER, R. A.
Interstital Water Chemistry of Anoxic Long Island Sound Sediments. 2. Nutrient Regeneration and Phosphate Removal,
W79-02243 5C

BERTHOUEX, P. M.
Characterization and In-Plant Reduction of Wastewater from Hog Slaughtering Operations,
W79-02298 5D

BETANCOURT, O. J.
Filration System,
W79-02332 5D

BEUTLER, B.
Assessment of Hazardous Waste Practices in the Petroleum Refining Industry,
W79-02440 5D

BICKING, C.
Procedure for the Evaluation of Environmental Monitoring Laboratories,
W79-02149 5A

BILLEN, G.
A Budget of Nitrogen Recycling in North Sea Sediments off the Belgian Coast,
W79-02245 5C

BILLINGS, W. D.
Root Production and Root Turnover in a Wet Tundra Ecosystem, Barrow, Alaska,
W79-02100 2I

BISHOP, C. T.
Anion Exchange Method for the Determination of Plutonium in Water: Single-Laboratory Evaluation and Interlaboratory Collaborative Study,
W79-02145 5A

BISSET, R.
Quantification, Decision-Making and Environmental Impact Assessment in the United Kingdom.
W79-02028 6G

BJERK, J. E.
Organchlorines in Codfish from Harbours Along the Norwegian Coast,
W79-02479 5C

BLACKWOOD, T. R.
Source Assessment: Water Pollutants From Coal Storage Areas,
W79-02144 5B

BLISS, J. D.
Prediction of Phytoplankton Productivity in Lakes,
W79-02055 5C

BLOSSER, R. O.
Investigations of Heat Treatment for Paper Mill Sludge Conditioning,
W79-02296 5E

BLOUNT, A. E.
The Urquiola Oil Spill, La Coruna, Spain: Impact and Reaction on Beaches and Rocky Coasts,
W79-02500 5C

BOELTER, D. H.
Minnesota's Peat Resources: Their Characteristics and Use in Sewage Treatment, Agriculture, and Energy,
W79-02255 5G

BOERSMA, L.
Protein Production Rates by Algae Using Swine Manure as a Substrate.
W79-02489 5D

Yield Response to Soil Warming: Agronomic Crops,
W79-02490 3F

BOIKO, N. A.
Purification of Effluents of the Verkhotursk Wood Chemical Plant in Storage Ponds (Ochistka stochnykh vod Verkhoturskogo Lesokhimicheskogo Zavoda v prudu-nakopitele),
W79-02372 5D

BOISSEAU, D. B.
Ammonium Oxidation and its Significance in the Summer Cycling of Nitrogen in Oxygen Depleted Skan Bay, Unalaska Islanda, Alaska,
W79-02004 5C

BOKUNIEWICZ, H. J.
Transportation and Accumulation of Fine-Grained Sediments in the Estuarine Environment: Recommendations for Research,
W79-02165 2L

BOLLYKY, L. J.
Ozone Treatment of Cyanide-Bearing Plating Waste,
W79-02299 5D

BOLTE, W. B.
Home Water Distiller,
W79-02319 5F

BOND, W. J.
The Colonization of Cabora Bassa, Mocambique, A New Man-Made Lake, by Floating Aquatic Macrophytes,
W79-02231 4A

BONDARCHIK, N. G.
Chemical Foam Control During Effluent Treatment in Aeration Tanks (Khimicheskoe penogashenie pri ochistke stochnykh vod v aerotenkakh),
W79-02382 5D

BONDE, E. K.
Factors Influencing Usefulness of Antitranspirants Applied on Phreatophytes to Increase Water Supplies,
W79-02291 3B

BONE, D. H.
Nitrate Reduction by Denitrifying Bacteria in Single and Two Stage Continuous Flow Reactors,
W79-02406 5D

BONNER, G. D.
Filration System,
W79-02332 5D

BOROWCZYK, J. J.
Grease Separator,
W79-02342 5D

☆U.S. GOVERNMENT PRINTING OFFICE: 1979-281-061/17

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 12, NUMBER 6
MARCH 15, 1979

W79-02501--W79-03000
CODEN:SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 6
MARCH 15, 1979

W79-02501--W79-03000

e Secretary of the U.S. Department of the Interior has de-rmined that the publication of the periodical is necessary in the nsaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

MULTIMODE MODELING OF THE WATER MOLECULE,
Science Applications, Inc., La Jolla, CA.
D. Rogovin, T. Stephens, and W. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 397, Price codes: A05 in paper copy, A01 in microfiche. Report AFWL-TR-253, Air Force Weapons Laboratory, Kirtland Air Force Base, New Mexico, Aug 1977. 71 p, 5 fig, 22 tab, 11 ref. F29601-75-C-0132.

Descriptors: *Water vapor, *Molecular structure, *Mathematical models, *Model studies, Water, Water structure, Attenuation, Light, Physical properties, Chemical properties, Atmosphere, Rotation-vibration energy levels.

This report presented three approaches to multimode modeling water vapor. These are: (1) A correlated bender approach that treats fluctuations in the bend angle as well as correlations of the bending mode with the OH stretch mode. Only a single 'effective' nuclear coordinate is used. (2) A model that treats all three vibrational degrees of freedom, mode-mode coupling as well as molecular rotation. In addition, the effects of centrifugal distortion are included in a nonperturbative manner. (3) A phenomenological approach based on the concept of fitting the A, B, and C rotation matrices, both diagonal components, to the rotation-vibration energy levels. This approach, although phenomenological in nature, is predictive. (Sims-ISWS)

WATER BALANCE OF ASIA, (IN RUSSIAN),
Akademiya Nauk SSSR Moscow. Inst. Geografii.
G. M. Nikolaeva, and G. M. Chernogaeva.
Sovietskoye Radio, Moscow (USSR), 1977. 115 p, 22 fig, 15 tab, 186 ref, 1 append.

Descriptors: *Water balance, *Asia, Water resources, Hydrologic cycle, Precipitation(Atmospheric), Runoff, Surface runoff, Subsurface runoff, Groundwater, Groundwater movement, Evaporation, Rainfall, Snowfall, Rivers, Distribution patterns, Mapping, Hydrology, *USSR.

This monograph was one of the issues in the series of publications prepared at the department of Hydrology, Institute of Geography, Academy of Sciences of the USSR. The work was based on the differentiated method of studying water balance. Besides defining precipitation, river runoff, and evaporation, the method discovered the land phase of the hydrologic cycle. Water balance elements, such as precipitation, total runoff, underground runoff, surface runoff, evaporation, and total moistening of an area, were determined for 220 river basins on the territory of Asia outside the USSR and for 600 basins of the Asian part of the USSR. For hydrologically unstudied areas, water balance elements were estimated on the basis of a series of interpolation relations between precipitation, total river runoff, and total moistening of the area. These relations are zonal by their nature since they reflect the dependence of the water balance elements on the natural environment in which their formation occurs. One of the major results of the study was the compilation of generalized maps on the water balance elements. The maps made it possible to reveal regularities and peculiarities of water balance distribution over the area of Asia and to assess chief water sources involving countries hydrologically poorly studied. Asia is the part of the world where the whole variety of the physiogeographic conditions of earth manifests itself, from tundra in the far north to the equatorial forests of Indonesia. Water balance maps, compiled for each of the water balance elements, made it possible, with the help of planimetry, to estimate river and surface flood runoff and the most regulated groundwater runoff drained by rivers. Tables presented the results of the estimates.

2B. Precipitation

ACCURACY OF CANADIAN SNOW GAGE MEASUREMENTS,
Atmospheric Environment Service, Downsview (Ontario).
B. E. Goodison.
Journal of Applied Meteorology, Vol. 17, No. 10, p 1542-1548, October 1978. 5 fig, 17 ref.

Descriptors: *Snowfall, *Measurement, *Precipitation gages, *Canada, Snow, Precipitation(Atmospheric), Rain gages, On-site investigations, Data collections, Regression analysis, Data processing, Winds, Snow cover, Melt water, Snow melt, Snow surveys, Meteorology.

A field investigation to assess the accuracy and comparability of precipitation gage measurements of snowfall in Canada was initiated in 1973. The MSC Nipher shielded snow gage (Canadian standard gage), the Universal (Belfort) precipitation gage, and the Fischer and Porter precipitation gage were tested at open and sheltered sites. Shielded and unshielded pairs of gages were compared at an open site. Gage catch was related to 'ground true' snowfall water equivalent as measured on snow boards in a sheltered site. Each gage tested had unique performance characteristics. Curves of gage catch to ground true as a function of wind speed were given. The catch ratio of the Universal gage is higher than the Fischer and Porter for similar shielding and environmental conditions. The MSC Nipher shielded gage exhibits a superior catch efficiency. At lower wind speeds, this gage can overcatch. For winds up to 5.5 m/s, the catch of the Nipher gage is within 10% of true. A mean correction of 0.15 mm for retention loss is required for this non-recording gage. Reasons for the efficiency of this gage were suggested. Users of gage measurements of snowfall water equivalent in Canada must consider the method of measurement before analyzing or correcting snowfall data. (Sims-ISWS)

CLIMATE: WET COASTAL ECOSYSTEMS,
Stuttgart Univ. (Germany F.R.). Botanisches Inst.
H. Walter.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 61-67. 7 fig, 14 ref.

Descriptors: Salt marshes, *Mangrove swamps, *Climates, Wetlands, Marshes, Coastal marshes, Marsh plants, Geographical regions, Ecological distribution, Temperature, Rainfall.

Climate is of significance both for azonal vegetation of salt marshes and mangrove swamps, species distribution on a large scale, and patterns on a small scale. Mangrove swamps occur only in the tropical region, approximately between 32 degree N and 38 degree S due to mangrove's sensitivity to frost. Temperature requirements of the various mangrove swamps are not the same; however, even in a continuously humid climate the number of species decreases with increased distance from the Equator. The lack of mangroves along sections of the west coasts of North American and Africa is related to low water temperatures of cold ocean currents which wash their shores. Rainfall conditions can affect zonation with the tidal region by its effect upon salinity. Salt marshes in the climate zones outside the tropics can locally show such a high concentration of salt in the soil that areas without vegetation can occur. Marshes also show an impoverishment of species with increasing latitude and decreasing temperature. Along the sea coasts from the entire tropics into the Artic and Antarctic salt marshes ane composed exclusively of herbaceous halophytes. Only in the areas without cold winter, but isolated cold snaps, do some partly liquifed shrubs occur. (See also W79-02762) (Steiner-Mass)

NORMAL PRECIPITATION IN WEST VIRGINIA,
West Virginia Univ., Morgantown. Coll. of Agriculture and Forestry.
R. Lee, S. Tajchman, D. G. Boyer, and E. W. Repa.
West Virginia Agriculture and Forestry, Vol. 7, No. 2, p 12-18, December 1977. 10 fig, 4 tab, 3 ref. OWRT A-023-WVA(4), 14-34-0001-6051.

Descriptors: *Precipitation(Atmospheric), *West Virginia, Climatology, Dry seasons, Isohyets, Rainfall, Rainfall disposition, Snowfall, Wet seasons.

West Virginia lies near the average path of west-to-east cyclonic migrations that produce extensive activity during the colder months. Because of the topography, the climatologic diversification is exceptional. 'Normal' monthly and annual precipitation are defined, for purposes of this report, as mean values for the 30-year priod, 1947-76. Extensive tables, graphs, and illustrations, show the characteristics of normal and extreme precipitation in the state. Normal annual precipitation at individual stations ranges from about 32 to about 67 inches. County means range from about 34 to more than 56 inches. Normal annual precipitation for the entire state (based on a 66-station average) is 43.3 inches, but a more realistic average is 44.8, and the true normal precipitation must be about 47 inches. Precipitation is mostly rain. Normal annual snowfall depths range from about 15 to more than 150 inches, a maximum of about 25 percent of the normal precipitation. (Dodson--West Virginia)

W. F. Weeks, and A. J. Gow.
Journal of Geophysical Research, Vol. 83, No. C10, p 5105-5121, October 20, 1978. 15 fig, 2 tab, 62 ref.

Descriptors: *Sea ice, *Ice, *Arctic, *Coasts, *Arctic Ocean, On-site investigations, On-site data collections, Crystals, Crystal growth, Anisotropy, Ice cover, Cold regions, Islands, Oceans, Ice-water interfaces, Crystal orientations, Crystal alignments.

Field observations of the growth fabrics of the fast and near-fast ice along the coasts of the Beaufort and Chukchi seas showed that at depths of more than 60 cm below the upper ice surface the sea ice crystals show striking alignments within the horizontal plane. At one site, this alignment was well developed at a depth of 15 cm, and in all cases the degree of preferred orientation increased with depth. In general, the c axes of the crystals were aligned roughly E-W parallel to the coast. In the vicinity of islands, alignment roughly paralleled the outlines of the islands, and in narrow passes between islands the alignment paralleled the channel. These observations, as well as similar observations made in the Kara Sea, can be explained if it is assumed that the c axes of the crystals are aligned parallel to the 'long-term' current direction at the sea ice-seawater inteface. The alignments are believed to be the result of geometric selection among the growing crystals, the most favored orientation being that in which the current flows normal to the (0001) plates of ice that make up the dendritic ice/water interface characteristic of sea ice. It was hypothesized that current flow in this direction reduces the thickness of the solute boundary layer as well as the salinity in the liquid at the interface. This lowered salinity allows crystals in the favored orientation to extend farther into the melt than neighboring crystals with less favored orientations. In addition, the current tends to induce a continuous flux of supercooled seawater against the sides of the crystals that extend ahead of the interface. This favors their lateral growth. The aligned crystal aggregate that forms has the overall characteristics of a single crystal. The development of such crystal alignments results in pronounced anisotropy in the mechanical, thermal, and electrical properties of fast ice. It was suggested that such crystal orientations can be used as an aid in determining current patterns in perennially ice-covered areas such as the Canadian ARchipelago. (Sims-ISWS)

Descriptors: *Ice, *Ice loads, *Structures, *Laboratory tests, *Model studies, Strength, Compressive strength, Tensile strength, Shear strength, Sea ice, Ice cover, Piles(Foundations), Bearing piles, Offshore platforms, Bridges, Cold regions, Mathematical models, Mechanical properties, *USSR, Ice forces.

Ice forces are the principal concern in designing offshore structures such as drilling platforms, transloading points, or bridge piers in arctic regions. Although some results have been obtained by field measurements in recent years, there are still significant gaps in the knowledge of ice forces on structures. In order to fill some of these gaps, the Iowa Institute of Hydraulic Research has undertaken model studies on the investigation of ice forces on vertical piles. Model techniques for the study of icebreaking phenomena have been developed, and the similarity between the model indications and prototype conditions has been demonstrated. Tests on the relationships between ice forces (ice strength) and pile diameter, between ice

thickness and relative velocity (strain rate), and between ice and structure have been completed. The experimental results were explained satisfactorily by a theoretical approach, and the combination of these relationships led to a basic empirical formula for the calculation of the maximum penetration strength for a circular pile, which agrees with available field measurements and also in part with model investigations in Russia. The suggested formula was modified for application to different structural shapes and degree of contact between ice and structure as well as for application to the indentation case of pile-ice interaction. Further studies are necessary to investigate the effect of ice temperature, scale effects, and the influence of salinity on the ice forces on structures. (Sims-ISWS)

GLACIER SURVEYS IN ALBERTA - 1975,
Department of Fisheries and Environment, Ottawa (Ontario). Water Resources Directorate.
I. A. Reid, J. O. G. Charbonneau, and L. A. Warner.
Report Series No. 60, 1978, 17 p., 8 fig., 4 maps, 9 ref.

Descriptors: *Glaciers, *Surveys, *Maps, *Mapping, *Volumetric analysis, Water resources, Streamflow, *Canada, *Alberta, *Athabasca glacier, *Saskatchewan glacier, Triangulation stations.

Glaciers act as natural regulators, storing water in winter and releasing it in summer. To gain some understanding of this phenomenon and the contribution which glaciers make to streamflow, the predecessors of the Water Survey of Canada began glacier surveys in 1945. The earlier surveys offered some clue to the role of the glacier, but the data collected were not sufficient to provide the overall picture. Following adoption of photogrammetric survey techniques, however, the glacier surveys have evolved to the extent that it is now feasible to produce a series of maps from which the linear, areal, directional and volumetric changes can be determined. The surveys have revealed that the glaciers, in general, are becoming smaller in size; hence the regulating effect on streamflow is diminishing. (WATDOC)

Scientific Series No. 95, 1978. 9 p, 2 fig, 10 ref, 9 tab.

Descriptors: *Climatology, Analysis, *Data collections, *Glaciers, *Correlation analysis, Variability, Weather, Runoff, *Canada, *Sentinel Glacier, *British Columbia, *Components loadings.

Multivariate analysis is being carried out on glacier-climatological data in two stages. This paper describes the first stage, which is an application of principal components technique to the available data. The multicollinear climatological variables are transformed into orthonormal principal components. The characteristics and the interpretation of these principal components are described. Data transformations and the ensuing results are explained. The transformed new variables, the component vectors, are interpreted in terms of weather types. Recommendations are given for the second stage of the analysis, which is an application of multiple regression on principal components aimed at the estimation of runoff. (WATDOC)

H. Bielorai, and P. A. M. Hopmans.
Agronomy Journal, Vol. 67, No. 5, p 629-632. September-October 1975. 6 fig, 1 tab, 11 ref.

Descriptors: *Moisture stress, *Transpiration, *Photosynthesis, *Cotton, Irrigation, Irrigation effects, Crop response, Crop production, Soil water, Soil moisture, *Leaf water potential.

The ability of a plant to recover from temporary and/or prolonged stress and the rate of recovery are of great importance in crop production. However, the information available on this subject is relatively scarce. A study was conducted to evalute the recovery of irrigated cotton following soil moisture stress of various durations through the measurements of soil moisture stresss using (1) the soil-moisture retention function, leaf water potential, by pressure bomb, and (2) leaf diffusion resistance by diffusive resistance porometer. Photosynthesis was measured by an infrared gas analyzer, and transpiration by weighing. Neither leaf resistance nor transpiration fully returned to pre-stress conditions after irrigation. Continued measurements of net photosynthesis also showed a delayed and only partial recovery from soil water stress.

UNSTEADY STREAMFLOW SIMULATION USING A LINEAR IMPLICIT FINITE-DIFFERENCE MODEL,
Geological Survey, NSTL Station, MS. Water Resources Div.
L. F. Land.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 127, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 78-59, May 1978. 59 p, 1 fig, 7 ref.

Descriptors: *Unsteady flow, *Model studies, *Channel morphology, *Reach(Streams), *Simulation analysis, Flow rates, Streamflow, Roughness coefficient, Mannings equation, Hydraulic properties, Backwater, Computer models, *Finite-difference model.

A computer program for simulating one-dimensional subcritical, gradually varied, unsteady flow in a stream has been developed and documented. Given upstream and downstream boundary conditions and channel geometry data, roughness coefficients, stage, and discharge can be calculated anywhere within the reach as a function of time. The program uses a linear implicit finite-difference technique that discritizes the partial differential equations. Then it arranges the coefficients of the continuity and momentum equations into a pentadiagonal matrix for solution. Because it is a reasonable compromise between computational accuracy, speed and ease of use,the technique is one of the most commonly used. The upstream boundary condition is a depth hydrograph. However, options also allow the boundary condition to be discharge or water-surface elevation. The downstream boundary condition is a depth which may be constant, self-setting, or unsteady. The reach may be divided into uneven increments and the cross sections may be nonprismatic and may vary from one to the other. Tributary and lateral inflow may enter the reach. The digital model will simulate such common problems as (1) flood waves, (2) releases from dams, and (3) channels where storage is a consideration. It may also supply the needed flow information for mass-transport simulation. (Woodard-USGS)

METHODS FOR ESTIMATING THE MAGNITUDE AND FREQUENCY OF FLOODS IN ARIZONA,
Geological Survey, Tucson, AZ. Water Resources Div.
R. H. Roeske.
Arizona Department of Transportation Report, Phoenix, Report ADOT-RS-15-121, September 1978. 82 p, 9 fig, 5 tab, 14 ref. (Prepared in cooperation with Department of Transportation, Federal Highway Administration.) HPR-1-15(121), 73-10.

Descriptors: *Flood frequency, *Flood peak, *Estimating, *Regression analysis, *Regional analysis, Arizona, Peak discharge, Methodology, Equations, Evaluation, Ungaged sites, Basin characteristics.

Regression equations for estimating flood magnitudes at ungaged sites for recurrence intervals of 2, 5, 10, 25, 50, 100, and 500 years were developed for six flood-frequency regions in Arizona. The equations relate flood magnitudes to one or more of the following statistically independent variables: size of drainage area, mean basin elevation, and mean annual precipitation. The regression equations are based on annual peak-discharge data collected at 221 gaging stations having 10 or more years of record. Flood magnitudes for selected recurrence intervals were determined for each station from a log-Pearson Type III frquency distribution, and multiple-regression analyses were used to relate flood magnitudes to basin characteristics. The regression equations apply to streams that are not affected significantly by regulation, diversion, or urbanization. Flood magnitudes and frequencies for the main stem of the Little Colorado River from the Zuni River to the mouth and for the main stem of the Gila River can be estimated from graphs in which discharge is related to size of drainage area for the Little Colorado River and to miles upstream and downstream from Coolidge Dam for the Gila River. (Woodard-USGS)
W79-02649

A RAINFALL-RUNOFF MODELING PROCEDURE FOR IMPROVING ESTIMATES OF T-YEAR (ANNUAL) FLOODS FOR SMALL DRAINAGE BASINS,
Geological Survey, Lakewood, CO. Water Resources Div.
R. W. Lichty, and F. Liscum.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 187, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 78-7, August 1978. 44 p, 9 fig, 7 tab, 23 ref.

Descriptors: *Model studies, *Floods, *Small watersheds, *Rainfall-runoff relationships, Regional analysis, Mathematical models, Analytical techniques, Regression analysis.

Maps depicting the influence of a climatic factor, C, on the magnitude of synthetic T-year (annual) floods were prepared for a large portion of the eastern United States. The climatic factors were developed by regression analysis of flood data using a parametric rainfall-runoff model and long-term rainfall records. Map estimates of C values and calibrated values of rainfall-runoff model parameters were used as variables in a synthetic T-year flood relation to compute 'map-model' flood estimates for 98 small drainage basins in a six-state study area. Improved estimates of T-year floods were computed as a weighted average of the map-model estimate and an observed estimate, with the weights proportional to the relative accuracies of the two estimates. The accuracy of the map-model estimates was appraised by decomposing components of variance into average time-sampling error associated with the observed estimates and average map-model error. Map-model estimates have an accuracy, in terms of equivalent length of observed record, that ranges from 6 years for the 1.25-year flood up to 30 years for the 50- and 100-year flood. (Woodard-USGS)

SURFACE WATER RESOURCES OF NORTHWEST FLORIDA,
Johnson (Bernard), Inc., Houston, TX.
Z. Qureshi.
Water Resources Bulletin, Vol. 14, No. 3, p 710 718, June 1978. 2 fig, 2 tab, 8 ref.

Descriptors: *Surface waters, *Florida, *Precipitation, *Evapotranspiration, *Basins, *Water budgets, Drainage, Inflow, Outflow, Runoff, Gaging stations, Groundwater.

Of the 1,700 streams located in Florida, the northwest area contains approximately 1,000 streams and three of the five largest rivers, namely the Apalochicola, the Choctawhatchee and the Escambia. This 11,200 square-mile area contains 11 drainage basins and receives an average annual rainfall which ranges from 53 inches in the east to 67 inches in the west. Basin water yields range from a high of 3,376 cfs (2,180 mgd) to a low of 672 cfs (434 mgd). Individual basin outflows range from a high of 25,743 cfs (16,630 mgd) to a low of 844 cfs (545 mgd). Approximately 67 percent of the total northwest Florida basin outflows to the Gulf of Mexico, or 36,805 cfs (23,766 mgd), are received in the form of surface water inflows from Alabama and Georgia. In the absence of any interstate mechanism for water management between Alabama, Florida, and Georgia, the basin outflow estimates presented herein depend greatly on the upstream usage in the neighboring states. The establishment of a tri-state water management program could eliminate the uncertainty involved in predicting water availability in northwest Florida and insure sufficient quantities of flows in the streams. GROUNDWATER IN THE NEWBERG AREA, NORTHERN WILLAMETTE VALLEY, OREGON,
Geological Survey, Portland, OR. Water Resources Div.
F. J. Frank, and C. A. Collins.
Oregon State Engineer Ground Water Report No. 27, 1978. 77 p, 9 fig, 2 plates, 6 tab, 18 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water wells, *Water level fluctuations, *Water quality, Groundwater availability, Water yield, Withdrawal, Groundwater recharge, Hydrogeology, Drillers logs, Oregon, *Northern Willamette Valley, *Newberg area.

The Newberg area in Oregon consists of a series of uplands bounded by narrow low-lying plains and valleys and is approximately 360 square miles in size. In the western part, many of the wells that tap older volcanic and marine sedimentary rocks produce insufficient volumes of water for most uses. With the exception of the Troutdale Formation, nonmarine sedimentary rocks generally are poorly permeable sand and silt or lack the necessary thickness to store large volumes of water. Yields of most wells tapping the Troutdale Formation range from 20 to 150 gallons per minute. The most important aquifer in the area is the Columbia River Basalt Group. Wells drilled into the basalt generally produce from 15 to 1,000 gallons per minute. In a small part of the east side of the Newberg area, water levels in some wells have declined about 1 foot per year. In most of the basalt outcrop area, water-level fluctuations are seasonal. Ground water from the Columbia River Basalt Group and the nonmarine sedimentary rocks is chemically suitable for domestic and most other uses. Some of the wells drilled into the marine sedimentary rocks produce water that is too mineralized for general use. (Woodard-USGS)

LINEAR GROUND-WATER FLOW, FLOOD-WAVE RESPONSE PROGRAM FOR PROGRAMMABLE CALCULATORS,
Geological Survey, Louisville, KY. Water Resources Div.
J. M. Kernodle.
Open-file report 78-356, July 1978. 48 p, 4 fig, 2 tab, 5 ref.

Descriptors: *Groundwater movement, *Flow, *Simulation analysis, Analytical techniques, Diffusivity, Surface-groundwater relationships, Model studies, Programming languages, Equations, Linear programming, *Programmable calculators.

Two programs are documented which solve a discretized analytical equation derived to determine head changes at a point in a one-dimensional ground-water flow system. The programs, written for programmable calculators, are in widely divergent but commonly encountered languages and serve to illustrate the adaptability of the linear model to use in situations where access to true computers is not possible or economical. The analytical method assumes a semi-infinite aquifer which is uniform in thickness and hydrologic characteristics, bounded on one side by an impermeable barrier and on the other parallel side by a fully penetrating stream in complete hydraulic connection with the aquifer. Ground-water heads may be calculated for points along a line which is perpendicular to the impermeable barrie and the fully penetrating stream. Head changes at the observation point are dependent on (1) the distance between that point and the impermeable barrier, (2) the distance between the line of stress (the stream) and the impermeable barrier, (3) aquifer diffusivity, (4) time, and (5) head changes along the line of stress. The primary application of the programs is to determine aquifer diffusivity by the flood-wave response technique. (Woodard-USGS)

In: Karst Hydrology and Water Resources, Proceedings of the U.S.-Yugoslavian Symposium, Dubronik June 2-7 1975. Water Resources Publications, p 793-814, June 1976, 4 fig, 3 tab, 20 ref. OWRT B-043-ARIZ(12), 14-31-0001-5056.

Descriptors: *Karst hydrology, Groundwater management, *Risks, *Bayes analysis, *Groundwater models.

Uncertainties in karst water resource systems are identified and analyzed from the viewpoint of decision making. A discrete system framework is used to establish a two-way classification of five system elements versus six types of uncertainties. Typical system elements are: rainfall (input), cavity size (state), rainfall discharge relationship (state transition function), benefit-cost (output), and loss curves (output function). The uncertainty types may be natural, model, sample, economic, technological, or strategic. The problem of design under uncertainty is illustrated by the control of a karst reservoir. The effects of natural, model, and economic uncertainty on the decision (pumpage or release out of the reservoir) are briefly illustrated. Then the finite state model (FSM) is used to ascertain how input uncertainty affects the output. Use of the same FSM model for state (cavity size) identification is cast in a Bayesian framework. A complete Bayesian analysis of input uncertainty is given, which leads to the evaluation of the value of perfect information and the worth of one more sample point. With the information provided on the effect of various uncertainties, it is possible to allocate resources optimally from the viewpoint of decreasing the overall uncertainty in the decision-making process.

Soil Science Society of America Journal, Vol 42, No. 3, p 437-440, May-June, 1978. 4 fig, 2 tab, 24 ref. OWRT A-087-MO(3), 14-34-0001-6026 and 7053.

Descriptors: Soil strength, Bulk density, Penetrometer, Root stimulation, *Root growth, *Fragipan, Soil horizons, *Hobson soil, *Root systems.

The effect of changes in acidity and bulk density of cores formed from B2 and fragipan horizons of a Hobson soil on probe penetration and pea root growth were evaluated. Increasing soil pH in the range of 4.2-6.5 had no measurable effect on probe resistance, but resulted in greater root length in both B2 and fragipan samples. Probe penetration resistance increased as bulk density was increased. The salty clay loam B2 horizon was more resistant to probe penetration than the sandy loam fragipan when compared at the same bulk density and moisture tension. Root length was more closely related to probe penetration resistance than to bulk density. Root growth in both B2 and fragipan soil decreased as probe resistance increased from 10 to 20 bars and essentially stopped in soil where probe penetration resistance exceeded 20 bars.

PREDICTION OF HYDRAULIC CONDUCTIVITY CHANGES USING SOIL CHARACTERISTICS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. G. Boyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 380, Price codes: A08 in paper copy, A01 in microfiche. M.S. Thesis, 1978. 143 p, 15 fig, 12 tab, 41 ref, 3 append. OWRT A-035-ARIZ(2), 14-34-0001-3803.

Descriptors: *Hydraulic conductivity, Permeameter, Soil sealants, *Arizona, *Soil analysis, Soil texture, Sodium adsorption ratios.

Permeameter experiments were performed on six Arizona soils using a solution of 12.5 meq/l and varied sodium concentrations. Hydraulic conductivities for five soils were reduced 60 to 95 percent for input solutions having maximum sodium adsorption ratios (SAR) of 25. Effective soil sealing occurred even though the soils were alkaline. Sealing sodium appears nearly irreversible at low solution concentrations and saturated conditions. The soil having the highest initial hydraulic conductivity recovered less than 20 percent of the original conductivity upon reapplication of a calcium solution. These results are useful when considering sealing small ponds by sodium applications. Hydraulic conductivity changes from increases in solution SAR were described mathematically using two empirically determined parameters that appear unique for each soil at a constant concentration. The parameters found for this study, plus those found from data of previous studies, were compared using multiple regression analysis to determine the most significant soil properties in predicting conductivity changes. Soil texture has the greatest influence on the parameters. An equation derived by combining data from eleven alkaline soils was selected as best for predicting hydraulic conductivities resulting from SAR changes. Predictions should be improved if additional soil data were available for analysis.

Water Resources Research, Vol. 14, No. 4, p 601-604, August 1978. 2 fig, 2 tab, 15 ref. OWRT A-058-VA(2).

Descriptors: *Hydraulic properties, *Soil water, *Infiltration, *Equations, Model studies, *Mathematical models, Soil moisture, Soil water movement, Soils, Soil texture, Soil properties, Hydraulic conductivity, Soil physics, Soil science, Empirical equations.

The soil moisture characteristic may be modeled as a power curve combined with a short parabolic section near saturation to represent gradual air entry. This two-part function-together with a power function relating soil moisture and hydraulic conductivity- was used to derive a formula for the wetting front suction required by the Green-Ampt equation. Representative parameters for the moisture characteristic, the wetting front suction, and the sorptivity, a parameter in the infiltration equation derived by Phillip, were computed by using the desorption data of Holtan, et al. Average values of the parameters, and associated standard deviations, were calculated for 11 soil textural classes. The results of this study indicated that the exponent of the moisture characteristic power curve can be predicted reasonably well from soil texture and that gradual air entry may have a considerable effect on a soil's wetting front suction. Tidal marsh soils are diverse and have been subjected to considerable mixing. The soils are wet, near neutral in pH and have organic matter and clays concentrated at the surface resulting in high cation exchange capacities. Limestone occurs within 0.5-2.0 m of the soil surface. Psammaquents occur in lower marsh and Haplaquods in the upper marsh sites. Sulfaquents were found at the mouth of the Suwannee River. SOILS OF MARINE MARSHES,
Scripps Institution of Oceanography, La Jolla, CA.
F. B. Phleger.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 69-77. 5 fig, 1 tab, 38 ref.

Descriptors: *Salt marshes, *Soil formation, *Sedimentation, Wetlands, Marshes, Coastal marshes, Muck soils, Soil microorganisms, Sedimentation rates, Tides.

The mineral composition of sediment varies upon the composition of the source materials availale in the drainage basin or in the adjacent open ocean. Organism contribute significant amounts of material in the form of plant debris and calcareous shell material. Marshes accumulate the finest sediment available in the system due to the low current velocities in the very shallow water. The finest sediments are deposited at the end of the tidal excursions where there is slack water or at the shallow edge of the estuary where dead water occurs. Marsh soils may have alternating laminae of coarse and fine sediment in certain locations. But most sediments are considerably reworked and otherwise modified by the roots of marsh plants and certain animals. Biogenic reworking can concentrate sand and product fecal pellets from organisms which ingest sediments to extract food. The pH of the soil surface water varies, depending on the time of day, and also upon the stage of the tide

in lagoonal marshes where there is marked tidal influence. Relative rates of deposition of sediment are indicated by the percent of the total foraminiferal, a type of shelled microorganism, population which is alive at the time of collection. (See also W79-02762) (Steiner-Mass)

AGE, GROWTH, AND FOOD HABITS OF THE FATHEAD MINNOW, PIMEPHALES PROMELAS, IN NORTH DAKOTA SALINE LAKES,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. W. Held, and J. J. Peterka.
Transactions of the American Fisheries Society Vol. 103, No. 4, p 743-756, October, 1974. 2 fig, 7 tab, 31 ref. OWRT A-027-NDAK(2), 14-31-0001-3534.

Descriptors: *Minnows, Life history, Studies, Ecology, Bioassay, Salinity, Resistance, Potholes, Lakes, *Fish reproduction, Fish eggs, *Fish diets, *North Dakota, *Saline lakes.

Fathead minnows (Pimephales promelas Rafinesque) were abundant in 9 of 10 prairie pothole lakes in south-central North Dakota, selected to represent extremes in salinity. Fathead minnows were found in lakes with mean concentrations of total dissolved solids during ice-free periods ranging from 285 to 7,036 mg/liter; no fish were found in North Lake George with a mean concentration of 23,489 mg/liter total dissolved solids. Crustaceans were the most important food group by number, volume, and frequency of occurrence in 541 fathead minnow intestines collected from seven lakes during summer and fall 1969. Cladocerans were most important, followed by copepods and amphipods. Analysis of 30 brook sticklebacks (Culaea inconstans) from Wildlife Lake, 13 Iowa darters (Etheostoma exile) from Barnes Lake, and 5 tiger salamander larvae (Ambystoma tigrinum) from South Alkaline Lake indicated that Crustacea was the most important food group for these organisms. Fathead minnow fry appeared in early June and were seined (0.32-cm mesh) throughout the summer from 1 July to 1 September. The mean total length was 41 mm at the end of the first year of life and 58 mm at the end of the second. Only one fathead minnow from 2,100 aged had three annuli. Most fathead minnows in the lakes studied matured and spawned during their second summer and then died.

WATER WETLANDS, AND WOOD STORKS IN SOUTHWEST FLORIDA,
Florida Univ., Gainesville, Dept. of Environmental Engineering Sciences.
J. A. Browder.
PhD Dissertation. August, 1976. 406 p.

Descriptors: *Wetlands, *Florida, *Water levels, *Wading birds, Water birds, Model studies, Simulation analysis, Computer models, Surface waters, Rainfall intensity.

Energy circuit models were used to study an oscillating ecosystem, the seasonally expanding and contracting wetlands of southwest Florida. Analog digital computers were used to simulate the effects of the natural rainfall pattern and of drainage on seasonal expansion and contraction of water area, production and concentration of fish, and feeding and reproduction of the Wood Stork (Mycteria americana). Regional-scale depth-area, area-volume, and depth-volume curves were developed to relate the intensity and timing of rain to the seasonally changing area of surface water. Classical hydrologic equations were combined with the regional curves to produce a water model simulating seasonal and long-term water storage and runoff. Patterns of land area covered by water from the water model were used to derive three models relating water patterns to fish and storks. Drainage and a downward trend is rainfall for the past 15 years have stressed the ecosystems causing a decline in wading birds. Simulations suggest that drainage more than decline in rainfall was responsible for the decrease in storks. Wood Storks have shown resiliency in adapting to the drained conditions, finding new feeding areas such as the marshes at Lake Okeechobee. (Steiner-Mass)

BIOLOGICAL PRODUCTIVITY IN TWO GEORGIA RIVER SWAMPS,
Tennessee Univ., Knoxville.
H E Boyd
PhD Dissertation, August, 1976. 98 p.

Descriptors: *Georgia, *Swamps, *Productivity, Wetlands, Oak trees, Nutrients, Mammals, Wildlife, Growth rates, Animal populations.

Data from coastal plain swamp sites showed correlations between the physiographic origins of two rivers, their load of dissolved and suspended matter, floodplain soil nutrient levels, height and diameter growth for the oak, Quercus laurifolia, and the standing crops and turnover of small mammal species. Soils of the Oconee River floodplain were statistically significantly higher in concentrations of Ca, Mg, NO3, and Na, and had a significantly high pH. The Canooche floodplain was significantly higher only in phosphate. Statistical tests comparing height on age and diameter on age for Laurel oaks showed significant differences between the two areas--both being faster in the Oconee floodplain. The oconee floodplain had higher densities of all small mammal species trapped. Only one species taken on the Oconee was not trapped on the Canoochee. Total cotton mouse biomass on the Oconee was as much as three times the biomass on the Canoochee when calculated from mean weights of each age category and the density for each period. The Oconee floodplain is believed to be more productive on the basis of greater cotton mouse biomass and turnover. (Steiner-Mass)

SPATIAL CHANGES IN WATERFOWL HABITAT,
Canadian Wildlife Service, Ottawa (Ontario).
G. D. Adams, and G. C. Gentle.
Occasional Paper Number 38, 29 p, 1978. 5 fig, 8 tab, 43 ref.

Descriptors: *Wetlands, *Wildlife habitat, *Waterfowl, *Spatial distribution, *Temporal distribution, Fresh water marshes, *Land use, Ducks(Wild), Aquatic habitat, Land classification, Distribution patterns, Vegetation.

The effects of land use on two waterfowl habitat types, waterfowl capability class 1 land (Block I) ad class 3 land (Block II), were assessed by documenting spatial changes in wetlands and vegetative cover occurring between 1964 and 1974. Block I showed a higher density and surface area in wetlands. On Block II, wetlands were more permanent, but cultivated land occupied proportionally more area. Both blocks showed net decreases in grassland and woodland areas, and net increases in wildlife areas. Wetland areas increased by 20% on Block I and 31% on Block II. Partial drainage influenced 15% of 424 wetlands on Block I, but 20% were altered by drainage and clearing, and 7% were lost during the decade. Open water marsh perimeter increased by 24% on Block I, but total wetland perimeters increased only slightly. Since only 53% of wetland perimeters were open on Block I in 1964, compared to 26% open on Block II, there was probably more intensive pothole clearing on Block I prior to 1964. Despite the net increase in wetland areas, the quantitative reduction in grassland cover on wetland margins has probably reduced potential duck nesting habitat. (Steiner-Mass)

DEVELOPMENTAL AND ENVIRONMENTAL HISTORY OF THE DISMAL SWAMP,
Indiana Univ. at Bloomington. Dept. of Botany.
D. R. Whitehead.
Ecological Monographs, Vol. 42, No. 3, p 301-315, 1972. 9 fig, 39 ref.

Descriptors: *Swamps, *Pollen, *Distribution patterns, *History, *Trees, *Virginia, Wetlands, Peat, Sediments, Geologic time, Vegetation, Dismal Swamp(Va NC), North Carolina.

Pollen analysis has indicated that the swamp is a relatively young feature, having begun to develop along drainage lows as recently as the late-glacial. Formation of extensive freshwater marshes along streams appears to have been brought about by general water table changes controlled by the post-glacial rise of sea level. As the sea continued to rise, marsh development proceeded inland and fine-grained organic sediments began to accumulate. By 6,000 B.P. approximately 50% of Dismal Swamp area had been mantled by fine-grained peat deposits. From 6,000 to 3,500 B.P. peat accumulation continued, but at an appreciably lower rate. This corresponds both to the hypsithermal interval and to a distinct slackening in the rate of sea level rise. By 3,500 B.P. peat had mantled virtually all of the interfluves and islands within the swamp. The pollen diagrams suggest a gradual change from boreal spruce-pine forests during the full-glacial, to somewhat less boreal pine-spruce during the late-glacial, to hardwood forests containing many species characteristic of the present northern hardwoods forests during the latter portion of the late-glacial, to hardwood-dominated forests containing species now found in southeastern Virginia during the early post-glacial. EFFECTS OF GRASS CARP INTRODUCTION ON MACROPHYTIC VEGETATION AND CHLOROPHYLL CONTENT OF PHYTOPLANKTON IN FOUR FLORIDA LAKES,
Florida State Game and Freshwater Fish Commission, Lake Wales.
R. D. Gasaway, and T. F. Drda.
Florida Scientist, Vol. 41, No. 2, p 101-109, Spring, 1978. 5 fig, 1 tab, 21 ref.

Descriptors: *Aquatic plants, *Fish, Effects, *Grass carp, Algae, Rooted aquatic plants, Ponds, Lakes, Wetlands, *Florida.

Effects of grass carp on macrophytes and phytoplankton were studied in two natural ponds, a natural lake and a borrow pit. Macrophytes were reduced in all study areas after grass carp introduction, and several native species were eliminated although they remained where protected from grass carp. Eleocharis acicularis in Suwannee Lake was reduced from 40.16% to 0.4% cover one year after introduction. Chlorophyll a, b, and c content increased although generic richness of phytoplankton declined after introduction. (Stihler-Mass)

J. R. Gat, and Y. Levy.
Limnology and Oceanography, Vol. 23, No. 5, p 841-850, September 1978. 2 fig, 3 tab, 14 ref.

Descriptors: Hydrology, *Isotope studies, *Surface waters, *Arid lands, Salinity, Salts, Brines, Coasts, Lakes, Runoff, Drainage, Evaporation, Groundwater, Subsurface waters, On-site data collections, Mathematical models, Data processing, Limnology, *Sabkhas, *Bardawil area(Sinai), *Sinai.

The changes in stable isotope composition of inland sabkhas can throw light on the hydrologic mechanisms which operate in these systems. Inflow waters were found to be of meteoric origin. Immediately after local rain, water drains from surrounding sand dunes onto the top of the salt crust, dissolving it. Further inflow of waters keeps the sabkhas inundated for weeks, but the different sabkhas were found to be open to varying degrees to the inflow of groundwaters and to outflow of brines into bottom sediments. RIFTING IN THE OKAVANGO DELTA,
Columbia Univ., New York.
C. H. Scholz.
Natural History, Vol. 85, No. 2, p. 34-43, February, 1976.

Descriptors: *Freshwater marshes, *Deltas, *Wildlife, *Geomorphology, Impounded water, Marshes, Wetlands, *Rifting, Natural refuge, Kalahari Desert, Botswana, Africa.

Okavango Delta, a perched water impoundment in the East African rift system formed by geologic faulting, is a fresh water swamp covering 6,500 sq miles in the Kalahari Desert region of Botswana. The delta supports a variety of plant and animal species including papyrus, mopani, pike, hippopotamus, crocodile, antelope, and ibis. It is one of the few game areas of Africa that has remained virtually unaffected by man due to its endemic

populations of tsetse flies and mosquitos. The region acts as a natural refuge and watering ground for many species during the dry season. Current pressures on the region arise from increasing demands for water supplies and the need for cattle grazing land. (Howard-Mass)

ASSESSMENT OF THE PHYSICAL AND BIOLOGICAL CHARACTERISTICS OF THE MAJOR LAKE CHAMPLAIN WETLANDS,
State Univ. of New York Coll. at Plattsburgh.
G. K. Gruendling, and D. J. Bogucki.
Lake Champlain Basin Study, New England River Basins Commission, Burlington, Vermont, May, 1978. 36 p, 21 tab, 12 ref.

Descriptors: *Freshwater marshes, *Lakes, *Classification, Wetlands, Northeast U.S., Hydrology, Marsh plants, Distribution patterns, Soil types.

A synopsis is given of the various descriptive data presently available on the wetlands of Lake Champlain. The physical section of the report examines wetlands using the hydrologic location, wetland topography and configuration, geomorphic features and mode of origin, and surficial material as main criteria. Twelve Lake Champlain wetlands are classified as either bayhead, riverine, riverine/levee, deltaic, or lakeside areas. The biological section is divided into two major parts. Part I characterizes twelve major wetland areas that have been investigated over the past few years. These have had detailed vegetation maps constructed for each wetland utilizing color and color infrared aerial photography, field surveys, and ecological studies relating plant distribution with soil types, water depths, and other environmental parameters. Part II summarizes cover-type maps for the remaining wetlands that have been investigated. (Steiner-Mass)

K. Loach.
Journal of Ecology, Vol. 56, No. 1, p. 117-127, March, 1968. 8 tab, 16 ref.

Descriptors: *Vegetation, *Competition, *Soil properties, *Deficient elements, *Wetlands, Phosphorus, Nitrogen, Soil structure, Primary productivity, Saturated soils, Bogs, Heaths, England.

Growth of the major species in three sites (molinietum, central associes, and valley bog) was compared in the absence of interspecific competition. Performance in this experiment did not always reflect the relative abundances in the natural plant cover of these sites (apparently due to competition). All species suffered the greatest reduction in dry weight when grown in the valley bog site. The soils were acutely deficient in phosphorus. In the field the phosphorus deficiency in the bog site is probably further aggrelated by the effects of waterlogging on root growth and nutrient uptake. Response to both these nutrients. Poor structure of the soils may have limited growth and response to nutrient additions in these soils. Drainage considerably improved growth in the Molinietum and central associes sites; drainage of the valley bog site was insufficient to improve growth because of the large nutrient deficiencies of the soils. Archiv Hydrobiologie, Vol. 76, No. 2, p. 198-217, October, 1975. 7 fig, 5 tab, 37 ref.

Descriptors: *Bogs, *Benthic fauna, *Distribution patterns, Wetlands, Peat, Aquatic animals, Aquatic microorganisms, Diptera, Lake soils.

Two of the major animal species inhabiting the mud of a bog lake show strong preferences for distinct areas of the bottom. This distribution is remarkable in view of the small size of the lake and the uniform water depth. The mud is composed entirely of peat, the only variation being in the size of the fragments in different parts of the lake. The two species--larvae of the midges Chironomus lugubris and Glyptotendipes paripes--are shown to be associated with sediments containing different proportions of fine particles. The association between substrate type and benthic animals is attributed to the relatively simple and stable nature of the ecosystem. (Steiner-Mass)

INFLUENCES OF SPRING WATER LEVELS ON AQUATIC AND RIPARIAN PLANT DISTRIBUTION IN UPPER RICHELIEU AND MISSISQUOI BAY AREAS,
Quebec Univ., Montreal. Dept. of Biological Sciences.
C. Hamel, and P. Bhereur.
Laboratory of Applied Botany, University of Quebec at Montreal, August, 1977. 55 p, 8 fig, 3 tab, 7 ref.

Descriptors: *Swamps, *Aquatic plants, *Water level fluctuations, Lakes, Wetlands, Distribution patterns, Water levels, Vegetation establishment, Reservoir management.

Water level variations in the Missisquoi Bay and Richelieu River regions of Lake Champlain has been related to the life cycles of the aquatic plants in the area. In spring, the annual and interim fluctuations are of considerable importance because of their effect on forest regeneration and pike spawning grounds. The water level mark has relatively little influence on the plant life cycles, particularly those of trees, which are affected to a much greater extent by the length of the flood period. It is improbable that a permanent lowering of the maximum water levels would have a large impact on swamp forests which are generally composed of species which are very resistant to prolonged flooding. The aquatic plants, which are favored by the absence of natural competitors over long flood periods, would normally disappear from these swamp zones during low water, giving way to shrubby and herbaceous terrestrial vegetation. The distribution of aquatic plants in summer depends to a great extent on the water level. With high water levels, many aquatic plants invade the forests and with low water levels these species will withdraw from the forests and invade the middle regions of rivers and bays. (Steiner-Mass)

WETLAND HABITAT EVALUATION, VANCOUVER LAKE, WASHINGTON,
Jones and Stokes Associates, Inc., Sacramento, CA.
K. Miller, and C. R. Hazel.
November, 1977. 54 p, 6 fig, 6 tab, 15 ref.

Descriptors: *Wildlife habitat, *Wetlands, *Marsh management, *Washington, Lakes, Fresh water marshes, Dredging, Spoil banks, Environmental effects, *Vancouver Lake(Wash).

This report identifies and describes wetland and lowland wildlife habitats surrounding Vancouver Lake and estimates the value of these habitats to the dominant faunal species. An attempt is made to rank habitat types in order of their value to wildlife. The impact of lake dredging and spoil disposal on wildlife habitats are compared and evaluated for each proposed disposal site. Alternative plans of spoil disposal designed to avoid or minimize adverse impacts on the most valuable wildlife habitats are suggested as mitigation measures. The impacts of these alternatives are compared to those of the proposed project. Mitigation measures in the form of like-kind or trade-off compensation are discussed. (Steiner-Mass)

FOSSIL PLANTS AND COAL: PATTERNS OF CHANGE IN PENNSYLVANIA COAL SWAMPS OF THE ILLINOIS BASIN.
Illinois Univ. at Urbana-Champaign. Dept. of Botany.
T. L. Phillips, R. A. Peppers, M. J. Avcin, and P. F. Laughnan.
Science, Vol. 184, No. 4144, p 1367-1369, June 28, 1974. 1 fig, 15 ref.

Descriptors: *Swamps, *Peat, *Coals, *Palynology, Pollen, Sediments, Spores, Temporal distribution, Clubmoss, Tree ferns, Wetlands, Marshes, *Illinois Basin(Ill).

Plant materials in coal balls are direct evidence of swamp vegetation, and through correlation of isolated spores and pollen with parent plants, coal palynology provides an extensive record of plant distribution. Lycopods, ferns, pteriodosperms, cordaites, and sphenopsids are five major plant groups which lived in peat-forming swamps. Changes in coal-swamp floras and the botanical constituents of coal throughout Pennsylvanian time are the result of broad climatic shifts and local environmental factors. The most striking change is from a lycopod-dominated flora to one in which tree ferns were the major element. This change occurred at the Desmoinesian-Missourian (Westphalian-Stephanian) boundary and was probably multicontinental in scope. (Howard-Mass)

2I. Water In Plants

FLORISTIC ANALYSIS OF THE MISSOURI RIVER BOTTOMLAND FORESTS IN NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Botany.
W. R. Keammerer, W. Johnson, and L. Burgess.
Canadian Field-Naturalist, Vol. 89, No. 1, p 5-19, 1975. 2 fig, 5 tab, 26 ref. Contribution No. 182 from the Eastern Deciduous Forest Biome, US-IBP, and Publication No. 628, Environmental Sciences Division, Oak Ridge National Laboratory. OWRT A-022-NDAK(3), 14-31-0001-3534.

Much of the forest vegetation along the upper Missouri River has been inundated and destroyed by a series of large reservoirs. In North Dakota, the remnant forests fall readily into two classes, those dominated by Populus deltoides Marsh., and the more mesic forest of Fraxinus pennsylvanica Marsh., Acer negundo L., Ulmus americana L., and Quercus macrocarpa Michx. The vascular flora of these forests is comprised of 220 species, representing 54 families and 152 genera. Seven families (Compositae, Gramineae, Cyperaceae, Leguminosae, Labiatae, Rosaceae, and Ranunculaceae), all large families abundant in north-temperate regions, account for over half the total flora. Analysis of the Raunkiaer life-form in the flora of the bottomland forests shows the composition to be predominantly hemicryptophytic (53.2%). Phanerophytes and cryptophytes make up about 17% each, therophytes 11%, and only 1% of the flora is chamaephytic. Geographically, 73.1% of the species are North American, including arctic, subarctic, sub-arctic-temperate. and temperate distributions. Another 8% are circumpolar, while 18.6% are of European or Eurasian derivation. Many of the latter are widespread and wellknown waifs, agricultural weeds, and other ruderal species. A complete checklist is given, including notes on local distribution and relative abundance.

APPLICATION OF FIVE METHODS FOR MEASUREMENT OF WILDLIFE VAUE; LOWER SHEYENNE RIVER BASIN, NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Agricultural Economics.
J. A. Leitch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 386, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, Dec 1975, 133 p, 10 fig, 17 tab, 63 ref, 12 append. OWRT B-030-NDAK(3), 14-31-0001-5102.

Descriptors: *Wildlife habitats, River basins, Priorities, River basin development, Evaluation, Wildlife, *North Dakota, *Sheyenne River Basin(ND).

An attempt was made to (1) describe the wildlife community of the Lower Sheyenne River Basin (LSRB), and (2) determine the value of that wildlife community. An estimate of the species composition of wildlife was determined from the literature and personal communications with State Game and Fish Department personnel. To determine the value of this wildlife, five techniques were applied to the LSRB: (1) utility value, (2) expenditures, (3) the value of comparative private recreation, (4) wildlife land value, and (5) the priority evaluator technique, a photo choice game simulating the marketplace. Resulting values were (1) annual utility value of $95,000 ($.11 to $1.16 per acre), (2) annual expenditures vaue of $304,777 ($.36 to $4.18 per acre), (3) annual value of alternative private recreation of $832,000 ($.98 to $14.93 per acre), and (4) the land value technique revealed an annual per acre return for wildlife of up to $33. The priority evaluator technique did not yield a specific value but revealed that people were more willing to sacrifice other environmental variables before wildlife habitat.

HABITAT AND SUCCESSIONAL CHANGES OF THE ATLANTIC COASTAL RIDGE OF PALM BEACH COUNTY, FLORIDA,
Florida Atlantic Univ., Boca Raton. Coll. of Science.
D. R. Richardson.
M.S. Thesis. December, 1976. 87 p.

Descriptors: *Florida, *Vegetation, *Succession, *Wetlands, Swamps, Freshwater marshes, Land use, Coastal plains, Marsh plants, Distribution patterns, Drainage effects.

Predrainage vegetational patterns of the Atlantic Coastal Ridge of Palm Beach County were mapped and a detailed analysis of vegetational changes regarding succession was made by selecting specific areas throughout the overall study region. These areas were described by documenting community changes with regard to species composition and community location. A checklist of the vascular flora was made for each selected area. Using the entire coastal strip vegetation maps and specific study sites, generalizations were made regarding plant succession in the major plant communities; Beach, Coastal Strand, Tropical Hammock, Low Hammock, Scrub, Pine Flatwoods, Wet and Dry Prairies, Mangroves, Swamp, and Freshwater Marshes. Pre- and post-drainage historical and hydrological information was correlated with a geological history in order to show how the physical and biological factors affect vegetation. (Steiner-Mass)
W79-02713

THE EFFECT OF SALINITY AND TIDAL INUNDATION ON PHOTOSYNTHESIS AND PLANT WATER RELATIONS OF SPARTINA ALTENIFLORA LOISEL,
Duke Univ., Durham, NC. Dept. of Botany.
D. J. Longstreth.
PhD Dissertation, 1976. 124 p.

Descriptors: *Salt marshes, *Marsh plants, *Salt tolerance, Wetlands, Tidal marshes, Coastal marshes, Grasses, Salinity, Plant growth, Productivity, Tides.

Plants grown under conditions of low daily irradiance showed a 50% decline in photosynthesis between 10 ppt and 30 ppt salinity. Plants grown at high daily irradiance showed relatively little effect of salinity on photosynthesis up to concentrations of 30 ppt. Analysis of resistance to the diffusion of CO2 showed that the differences in photosynthesis measured under high stress conditions were the result of an increase in both stomatal and internal resistance with the stomatal resistance being largest. Field measurements of diurnal patterns of leaf xylem pressure and photosynthesis indicate that timing of tides may be important in controlling daily photosynthetic patterns. As plants become exposed at low tide, water stress increases and photosynthesis apparently decreases even under conditions which would otherwise be optimal. Therefore, daily totals of carbon fixation may vary depending on the timing of the tide. Maximal totals of carbon fixation may occur on days when the timing of high tide would alleviate water stress the most. Root inundation also does not have a negative effect on photosynthesis and in fact inundation may have a positive effect on plant response by relieving water stress.

STUDIES ON THE ECOLOGY OF A STREAMSIDE FOREST: COMPOSITION AND DISTRIBUTION OF VEGETATION BENEATH THE TREE CANOPY,
Illinois Univ. at Urbana-Champaign. Dept. of Forestry.
D. T. Bell.
Bulletin of the Torrey Botanical Club, Vol. 101, No. 1, p 14-20, January-February, 1974. 2 fig, 1 tab, 13 ref.

Descriptors: *Forests, *Flood plains, *Ecological distribution, *Flood frequency, Wetlands, Habitats, Vegetation, Streams, Riparian plants, Flooding, *Illinois, Ecology.

Distributions of 64 understory species were examined in the streamside forest of Robert Allerton Park, Piatt County, Illinois. Understory vegetation was strongly influenced by the complex environmental gradient associated with a vertical distribution of flooding frequency. Lower portions of the gradient, inundated up to 20% of the time, harbor a hardy robust population of perennials. With increasing elevation, the number of species capable of surviving in the habitat increases. Mid-areas of the gradient do not harbor a unique plant association, but contain outliers from both the upper and lower portions. The light regime in the upper portions of the gradient further determines the partitioning of available habitat space. Unflooded areas experience a change in species dominance associated with the closing of the crown canopy in late spring. (Stihler-Mass)
W79-02752

NESTING WADING BIRD POPULATIONS IN SOUTHERN FLORIDA,
Everglades National Park, Homestead, FL.
J. A. Kushlan, and D. A. White.
Florida Scientist, Vol. 40, No. 1, p 65-72, Winter, 1977. 2 fig, 1 tab, 8 ref.

Descriptors: *Wading birds, *Florida, *Nests, *Surveys, Population, Birds, Wetlands, Wildlife, Animal populations, Seasonal, Waterbirds, Everglades, *Big Cypress Swamp(Fla).

A 1974-1975 survey located 41 colonies containing 129,800 wading birds including ibises, herons, and storks. The largest colony was a late summer-autumn nesting colony in the Okaloacooche Slough in the Big Cypress Swamp. Only 25,900 wading birds, about 20% of the southern Florida population, nested in Everglades National Park during 1975. This indicates a great reduction since the 1930's and strongly suggests that some aspects of the natural ecological processes are no longer functioning in the southern Everglades National Park. White Ibis and Cattle Egret were most abundant species; populations of Great Egrets, Little Blue Herons, Louisiana Herons and Snowy Egrets were lower than expected. Wading birds nested year round but individual species had more circumscribed nesting seasons. (Stihler-Mass)

Castanea, Vol. 42, No. 2, p 103-106, June, 1977. 1 tab, 6 ref.

Descriptors: *Vegetation, *Flood plains, *South Carolina, *Congaree River(SC), Deciduous trees, Swamps, Wetlands, Size, Trees.

The flood plain harbors 26 State and 8 National record-sized trees. Trees up to 170 feet in height and 26 feet in circumference occur here. Although a complete floristic study of the area is yet to be done, five county records, three of which are rare in the Carolinas, have been found in the Beidler Track of the flood plain. CATTLE, WILDLIFE, AND RIPARIAN HABITATS IN THE WESTERN DAKOTAS,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, CO.
K. E. Severson, and C. E. Boldt.
In: Management and Use of Northern Plains Rangeland. Reg. Rangeland Symposium, February 27-28, 1978, Bismarck, North Dakota, p 90-103. 17 ref.

Descriptors: *Riparian plants, *Grazing, *Cattle, Effects, *Habitats, *Livestock, Wetlands, Trees, Shrubs, *Great Plains, North Dakota, South Dakota, Range management, Agriculture.

Three riparian habitat types occur in the Northern Great Plains: draws in the upper reaches of grassland drainages, cottonwood-dominated floodplains, and juniper stands. Deciduous riparian habitats receive heavy livestock use because they provide shade, stay green longer than surrounding upland areas, and because they often indicate a water source. The results of such concentrated use are sparse stands of low vigor. Damage is induced by soil compaction, herbage removal and the resultant increase in soil temperature and evaporation from the soil, and physical damage to trees and shrubs. Observations indicate that season-long summer grazing is most detrimental. Management techniques that could prevent damage to woody species include alternating summer and winter use and changing the location of fences, watering places and salt stations. Prescribed fire may be useful for opening up shrub tickets or triggering sprout reproduction. (Stihler-Mass)
W79-02760

PLANT BIOMASS AND NET PRIMARY PRODUCTION ALONG A FLOOD-FREQUENCY GRADIENT IN THE STREAMSIDE FOREST,
Illinois Univ. at Urbana-Champaign. Dept. of Forestry.
F. L. Johnson, and D. T. Bell.
Castanea, Vol. 41, No. 2, p. 156-165, June, 1976. 4 tab, 20 ref.

Descriptors: *Biomass, *Primary productivity, *Flood plain, *Vegetation, Streams, Forests, Wetlands, Ecological distribution, Trees, *Illinois.

Biomass and net annual primary production were calculated for three flood-frequency zones in the streamside forest coenocline. Aboveground biomass estimates were 290.0 t/ha in the lower flood plain, 142.1 t/ha in the occasionally flooded transition zone, and 234.2 t/ha in the upland. Aboveground net primary production estimates were 12.5 t/ha/yr in the flood plain, 8.0 t/ha/yr in the transition zone, and 10.8 t/ha/yr in the upland. Data on the species distribution of biomass are presented. Biomass and primary production differences along the coenocline are considered to be the result of individual species responses to flooding, available water, disease, and timber cutting. SALT-MARSH ANIMALS: DISTRIBUTIONS RELATED TO TIDAL FLOODING, SALINITY AND VEGETATION,
Delaware Univ., Newark. Coll. of Marine Studies; and Delaware Univ., Newark. Dept. of Biological Sciences.
F. C. Daiber.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 79-108. 7 fig, 10 tab, 114 ref.

Descriptors: *Salt marshes, *Wildlife habitats, *Aquatic animals, *Distribution patterns, Wetlands, Coastal marshes, Marsh plants, Salinity, Aquatic environment, Muskrats, Wildlife, Aquatic life, Mollusks, Birds, Shore birds, Crabs, Crustaceans, Invertebrates.

Few species have tolerance limits broad enough to accommodate the variable conditions of a salt marsh. As a general rule, more species can be found in those shallow water areas seldom exposed to the air and those terrestrial regions seldom inundated even by storm tides. Zonation within a marsh is largely determined by salinity gradients, degree of inundation, and character of the substrate. Salinity affects the distribution of a wide range of species including Foraminifera, fiddler crabs, fish eggs and larvae, marsh birds, and muskrat. It acts directly on the osmotic regulatory device of some organisms through immersion and on the drinking mechanisms on others. It also affects vegetative zonation which determines animal distributions through locations and kinds of food and the availability of nest and home sites. Sediment type and particle size of the substrate influences the distribution of most burrowing animals. The adaptive techniques used for survival varies greatly between the animal groups to be found in salt marshes. (See also W79-02762) (Steiner-Mass)

SALT MARSH PLANT GERATOLOGY,
Georgia Univ., Brunswick. Marine Extension Service.
M. A. Hardisky, and R. J. Reimold.
Science, Vol. 198, No. 4317, p 612-614, November 11, 1977. 1 fig, 1 tab, 6 ref.

Descriptors: *Salt marshes, *Aquatic plants, *Biomass, *Productivity, Biological communities, Plant growth, Wetlands, Marshes.

The seasonal and spatial contribution of individual culms to overall biomass and structure of several salt marsh plant communities can be quantified through measurements of height increments and number of leaves. The continual addition of plant tissue to the marsh system by individual culms indicates the independence of peak standing crop biomass from annual production. This effect was more pronounced in the southern latitudes where seasonal climatic changes are less abrupt in controlling plant growth and senescence. Residence time of leaves, continual culm mortality, and pulses of detritus export are species dependent and constitute the essential processes controlling primary production that ultimately dictates the value of each plant species to the ecosystem. (Howard-Mass)

THE SEED BANKS OF PRAIRIE GLACIAL MARSHES,

Iowa State Univ., Ames. Dept. of Botany and Plant Pathology.
A. G. Van der Valk, and C. B. Davis.
Canadian Journal of Botany, Vol. 54, No. 15, p. 1832-1838, August 1, 1976. 1 fig, 2 tab, 20 ref.

Descriptors: *Freshwater marshes, *Aquatic plants, *Seeds, Soil properties, Vegetation effects, Marshes, Wetlands.

Sorensen's indices comparing the composition of seed banks within and among prairie glacial marshes ranged in value from 2 to 68%. Seed banks from different zones of the same marsh were more similar, with an average Sorensen's similarity index value of 41%, than seed banks from the same zone in different marshes where the average index values ranged from 24 to 28%. Differences among seed banks from marsh to marsh are due to differences in the vegetative composition of the marshes and the nature of the substrate. Allelopathic interactions in substrate samples with high amounts of organic matter may have resulted in either the inhibition of seed germination or the death of seedlings of several species. All marsh species were shown to be capable of dispersing to all zones of the marsh. (Howard-Mass)

PLANT STANDING CROP AND PRODUCTIVITY RELATIONS IN A SCIRPUS-EQUISTUM WETLAND,
McGill Univ., Montreal (Quebec). Dept. of Biology.
A. N. D. Auclair, A. Bouchard, and J. Pajaczkowski.
Ecology, Vol. 57, No. 5, p. 941-952, Late Summer, 1976. 8 fig, 1 tab, 72 ref.

Descriptors: *Standing crops, *Primary productivity, *Rooted aquatic plants, *Marshes, Aquatic plants, Growth rates, Marsh plants, Soils, Nutrients, Nitrogen, Phosphorus, Potassium, Hydrogen ion concentrations, Seasonal, Litter, Decomposing organic matter, Wetlands.

Dry weight shoot biomass, species composition, structure (species density, diversity, height) and soil parameters were examined on 45 1-sq meter plots in an extensive marsh complex in southern Quebec, Canada. Dominant emergent species included Scirpus fluviatilis, Equisetum fluviatile, Scirpus validus, Phragmites communis, and Eleocharis palustris. Shoot net productivity averaged 6.10 g/sq m/day, and terminal standing crop was 845 g/sq m. Seasonal productivity showed a strong biomodal pattern with peaks occurring in late-July and mid-September. Two-thirds of annual litter production was lost by export. Complete decomposition of the remaining litter occurred within the next growing season. Soil K had the highest correlation with standing crop while soil N had the highest correlation with shoot net productivity. Soil P was negatively correlated with all production. While shoot density and standing drop followed trends in soil nutrients, they coincided more closely with soil anion (nitrogen, hydrogen) concentration. Shoot net productivity and standing correlated negatively with all measures of species diversity. (Stihler-Mass)

PHOTOSYNTHETIC PROPERTIES AND ROOT CHILLING RESPONSES OF ALTITUDINAL ECOTYPES OF TYPHA LATIFOLIA L.,
Syracuse Univ., NY. Biological Research Labs.
S. J. McNaughton, R. S. Campbell, R. A. Freyer, J. E. Mylroie, and K. D. Rodland.
Ecology, Vol. 55, No. 1, p. 168-172, Winter, 1974. 3 fig, 6 tab, 25 ref.

Descriptors: *Cattails, *Ecotypes, *Altitude, Photosynthesis, Carbon dioxide, Temperature, Phosphorus, Roots, Ecology, Environmental gradient, Wetlands, Rooted aquatic plants.

Photosynthetic characteristics of two low-altitude and two high-altitude populations of the broad-leaved cattail (Typha latifolia L.) were compared. Light-saturation characteristics and light-saturated rates in normal air were identical. Although carbon dioxide saturation characteristics were similar, photosynthetic rates at high CO2 concentrations (> 350 ppm in air) were higher in high-altitude ecotypes. Carbon dioxide compensation concentrations of the populations were similar over a wide range of temperatures. The effects of root chilling on water and phosphorus uptake were also compared in a low-altitude and a high-altitude ecotype. Root chilling reduced leaf water content and phosphorus uptake more in the low-altitude ecotype. The photosynthetic differences between the ecotypes seem to have minor ecological significance, but reductions in water and nutrient uptake upon root chilling suggest strong natural selection in the high-altitude site for ability to function efficiently in cold soils. (Stihler-Mass)

THE PRODUCTIVITY OF A RANGE OF BLANKET BOG VEGETATION TYPES IN THE NORTHERN PENNINES,
Nature Conservancy, Alston (England).
G. I. Forrest, and R. H. Smith.
Journal of Ecology, Vol. 63, No. 1, p. 173-202, March, 1975. 9 fig, 13 tab, 16 ref, 1 append.

Descriptors: *Bogs, *Productivity, *Aquatic plants, Soil moisture, *Pennines, Wetlands, United Kingdom.

A two-fold variation in annual production of 481 to 868 g per sq m was determined between seven blanket bog sites representing a range of variation in floristic composition in the northern Pennines. The mean total annual net production for all seven sites was 659 + over - 53 g per sq m. Between-year variation was relatively small in comparison to that between sites. The sites with the highest production were those which had been recently burnt. For the remaining sites, assumed to be in a steady state situation, there was a trend of decreasing production with increasing wetness, reflecting decreasing contribution of Calluna and Eriophorum vaginatum only partly replaced by increased Sphagnum growth on the wetter sites. Mean production per growing season day for the four Calluneto-Eriophoretum sites was 1.98 g per m. The total production of the 1215 ha of blanket bog within the Moor House National Nature Reserve was estimated at 7,670,000 kg per year. (Howard-Mass)

A MODEL OF STAND PHOTOSYNTHESIS FOR THE WET MEADOW TUNDRA AT BARROW, ALASKA,
San Diego State Univ., CA. Dept. of Biology.
P. C. Miller, W. A. Stoner, and L. L. Tieszen.
Ecology, Vol. 57, No. 3, p. 411-430, Late Spring, 1976. 13 fig, 4 tab, 62 ref.

Descriptors: *Tundra, *Model studies, *Aquatic plants, Photosynthesis, Radiation, Air temperature, Soil temperature, Carbon dioxide, Humidity, Soil-water-plant relationships, Wetlands.

A model developed by the U.S. Tundra Biome, IBP, was used to simulate profiles of radiation, air temperature, humidity, plant water relations, and photosynthesis in the vascular plant canopy of the Wet Meadow Tundra. Of the incoming solar radiation, approximately 20% was reflected back and 32% to 53% absorbed by the canopy, increasing with leaf area index. Heat loss by convection was 5 to 10 times greater than loss due to evaporation. Total seasonal plant CO2 uptake ranged from 400 to 627 g per sq m of ground. Soil respiration was implied as a source of CO2. Photosynthesis increased with solar radiation, air and ground temperatures, and air vapor density and decreased with increasing infrared radiation and root resistance to water uptake. Net photosynthesis was higher at the top of the canopy. After subtracting leaf growth costs, total accumulated CO2 became positive late in the season and was highest at lower canopy levels. Photosynthesis seemed adjusted to maximize carbon gain under the most frequent conditions but not under all or extreme conditions.
W79-02946

NUTRIENT LIMITATIONS TO PLANT PRODUCTION IN TWO TUNDRA COMMUNITIES,
Alberta Univ., Edmonton. Dept. of Botany.
R. W. Haag.
Canadian Journal of Botany, Vol. 52, No. 1, p. 103-116, January, 1974. 2 fig, 10 tab, 65 ref.

Descriptors: *Tundra, *Productivity, *Nutrients, Phosphorus, Soil moisture, Soil temperature, Arctic, Lowland meadow, Wetlands.

Response to nitrogen fertilization in a lowland wet sedge meadow and an upland birch-willow-heath community, including increased protein content and dry weight productivity, indicates nitrogen supply limits production in both soils. Phosphorus supply does not limit production in the upland community, but dilution of the soil solution in the lowland meadow may decrease phosphorus available and cause this element to become limiting. Low soil temperature exerts an indirect limitation on plant production through reduction of the rates of organic matter decomposition and microbial nitrification, thus limiting the rate of nitrogen cycling. Available nitrogen can be taken up and metabolized despite low soil temperatures which, along with nitrogen availability, directly limit phosphorus metabolism. The importance of a low nutrient regime in the Arctic may be seen in the widespread occurrence of xenomorphic characters in many taxa, which require minimal mineral nutrition to best use their photosynthetic capacity. The low nutrient regime may partially explain the high proportion of perennial plants since these species can accumulate a nutrient pool over time from a deficient environment. (Howard-Mass)

New Delhi, 1977. 380 p, 58 fig, 78 tab, 280 ref. Translated from Russian.

Descriptors: *Bogs, *Drainage effects, Wetlands, Peat, Drainage, Habitats, Trees, Succession.

The principles of stand growth on drained peat and bog soils are discussed and the ecological-biological causes of varying drainage efficiency determined. When correctly implemented, the efficiency of drainage of boggy forests depends on the physical and chemical properties of the peat soils. The most important indices which determine the utility of peat soils for purposes of forest reclamation are ash content, botanical composition, and bulk density of peat. The important factors contributing to the improved growth of stands on drained bogs are: (1) total elimination of summer inundations and necrosis of roots, normalization of metabolism of trees, (2) increase in concentration of nutrient reserves in the root-inhabited layer of the soil because of its increased bulk density, (3) creation of favorable water and gas regime as also oxidation of toxic compounds in the relatively deep soil layers which were consantly or partly inundated earlier, and (4) increase in the thickness of the root-inhabited layer and improvement in the distribution of roots along the soil profile. Descriptors: *Wetlands, *Minnesota, *Classification, Freshwater marshes, Marsh plants, Distribution patterns, Wildlife habitat, Waterfowl.

A classification of wetland plant communities was developed for a study area in northcentral Minnesota in order to analyze data on waterfowl use of habitat that were gathered by radio telemetry. The classification employs features of several earlier classifications in addition to new classes for bogs and lakeshore communities. Brief descriptions are given for each community, and the important plant species are listed. Discriminant function analysis was used for 40 plant species. Seventy-five percent of the stands studied were classified correctly by this technique. Average probabilities of assignment to communities were calculated and helped to identify distinct and poorly defined communities as well as the relationship among communities. (Steiner-Mass)

V. S. Tomar, and B. P. Ghidyal.
Agronomy Journal, Vol. 67, No. 2, p 269-272, March-April 1975. 3 fig, 1 tab, 12 ref.

Descriptors: *Rice, *Transpiration, Soil-water-plant relationships, Irrigation, Irrigation practices, Flooding, Cultivation, *Cultural practices.

Rice is grown either in continuously flooded 'lowland' soils or under rainfed conditions in 'upland' soils. The objective of the study was to determine whether there are differences in resistance to water transport between plants grown in flooded and nonflooded soils. This information may be useful in understanding the plant-water relations under two cultural practices. The resistance to water transport in the non-flooded plants was nearly twice as high as in the flooded plants. The gradient between leaf and soil water potential increased markedly when plants were exposed to high air saturation deficit, however, the transpiration rate remained almost constant. These studies indicate the existence and development of large resistances to water transport in rice plants. (Skogerboe-Colo St)

TRANSFORMATIONS OF ORGANIC PHOSPHORUS SUBSTRATES IN SOILS AS EVALUATED BY NAHCO3 EXTRACTION,
Agricultural Research Service, Fort Collins, CO.
R. A. Bowman, and C. V. Cole.
Soil Science, Vol. 125, No. 1, p 49-54, January, 1978. 1 fig, 4 tab, 20 ref.

Descriptors: Chemical analysis, Organic compounds, Sodium compounds, Inorganic compounds, *Phosphorus, *Phosphorus compounds, Soil chemistry, Incubation, *Sodium bicarbonate extraction.

The sodium-bicarbonate method of Olsen et al. (1954) was primarily designed to extract inorganic P (Pi) and to correlate this P-pool with plant response. This procedure was used to follow the transformations of organic P (PO) substrates in soil. Various commercial PO substrates were added to a sandy loam soil, and were extracted immediately and after 1 to 18 days of incubation at field capacity. Glycerophosphate and all 3' nucleotide components of RNA were completely mineralized and accounted for in the NaHCO3 solution after 3 days. While RNA degraded in 18 days, sodium inositol hexaphosphate (Na-phytate) was relatively unaffected during this time and unrecoverable in the NaHCO3 solution upon immediate extraction. Thus, the labile compounds, like RNA, its four 3' nucleotides, and glycerophosphates were recoverable in the 0.5M NaHCO3-extracting solution (pH 8.5) of Olsen et al., while the Na-phytate, a relatively resistant compound, was not. Native Po was only slightly affected, however. A relatively constant amount of native Po was extracted, irrespective of extraction periods lasting 0.5 to 6 h. (Skogerboe-Colorado State)

J. M. Bewers, and P. A. Yeats.
Estuarine and Coastal Marine Science, Vol. 7, No. 2, p 147-162, August 1978. 7 fig, 2 tab, 34 ref.

Descriptors: *Trace metals, *Estuaries, *Canada, *On-site data collections, Heavy metals, Turbidity, Water analysis, Chemical analysis, Iron, Manganese, Cobalt, Copper, Zinc, Salinity, Data collections, Suspended solids, Water quality, Mixing, Intertidal areas, Cadmium, Distribution, Spatial distribution, Dissolved solids, *St. Lawrence Estuary.

The distributions of the trace metals iron, manganese, cobalt, nickel, copper, zinc, and cadmium in the upper St. Lawrence estuary were determined. The most important influence upon the distribution and behavior of the metals, apart from the character of the mixing between fresh and saline source waters, is the distribution and transport of suspended particulate matter. The estuarine turbidity maximum, which contains suspended particles enriched in cobalt relative to particles within both marine and river source waters, modifies the distribution of metals in the estuary and influences the character of the mixed outflowing water of salinity up to 20 parts per thousand. The influence of the turbidity maximum, which appears to be formed by particle trapping and the periodic settling and resuspension of sedimentary material, however, is confined to the estuary. Although the incoming and outgoing fluxes of suspended particulates in water are balanced, significant proportions of the influxes of iron (12%), manganese (19%), copper (24%), cobalt (27%), and zinc (44%) are removed within the system. The losses of iron, manganese, and cobalt occur predominantly at the expense of their particulate fractions. Suspended matter leaving the estuary in mixed surface water is depleted in manganese and cobalt, suggesting that the losses of these metals within the estuary occur primarily through the removal of exchangeable metal from riverborne particles within the turbidity maximum. A RAPID AND PRECISE METHOD FOR DETERMINING SULFATE IN SEAWATER, ESTUARINE WATERS, AND SEDIMENT PORE WATER,
Woods Hole Oceanographic Institution, MA. Joint Program in Biological Oceanography.
R. W. Howarth.
Limnology and Oceanography, Vol. 23, No. 5, p 1066-1069, September 1978. 2 tab, 11 ref. NSF OCE74-17859, DEB76-83877.

Descriptors: *Sulfates, *Chemical analysis, *Sea water, *Pore water, Water chemistry, Sediments, Salt marshes, Estuaries, Salinity, Chemicals, Volumetric analysis, Analytical techniques, Chemistry.

Sulfate can be rapidly and accurately measured by means of an indirect titration. Barium sulfate is precipitated in acid EDTA solution, the precipitate filtered and dissolved in an excess of EDTA at high pH, and the excess EDTA titrated with MgC12. Interferences from chloride, iron, or phosphate are negligible. Sulfides may interfere, but there is a procedure to remove this interference. The method determines the sulfate concentration in 1.0 ml of seawater with a standard deviation consistently less than 0.5% of the mean determination of three replicates. (Sims-ISWS)

MICROFLUOROMETRIC METHOD TO MEASURE AMMONIUM IN NATURAL WATERS,
Skidaway Inst. of Oceanography, Savannah, GA.
W. S. Gardner.
Limnology and Oceanography, Vol. 23, No. 5, p 1069-1072, September 1978. 4 fig, 12 ref. NSF OCE75-06423.

Descriptors: *Ammonia, *Water chemistry, *Chemical analysis, *Fluorometry, Analytical techniques, Chemical reactions, Sea water, Pore water, Fluorescence, Laboratory tests, Ions, Chemicals, Colorimetry, Chemistry.

Ammonium can be measured fluorometrically after a simple chromatographic separation from amino acids and reaction with o-phthalaldehyde. The method (less than 0.5-ml sample required) is sensitive down to 0.2 micrometer NH4(+) in seawater. Fluorescence is proportional to concentration over the range of 0-100 micrometer NH4(+), and analysis time is 6 min per sample. (Sims-ISWS)

DETERMINATION OF SUBMICROMOLAR CONCENTRATIONS OF AMMONIA IN NATURAL WATERS BY A STANDARD ADDITION METHOD USING A GAS-SENSING ELECTRODE,
Bigelow Lab. for Ocean Sciences, Boothbay Harbor, ME.
C. Garside, G. Hull, and S. Murray.
Limnology and Oceanography, Vol. 23, No. 5, p 1073-1076, September 1978. 2 fig, 10 ref. NOAA 04-7-022-4404.

Descriptors: *Ammonia, *Water chemistry, *Chemical analysis, Analytical techniques, Electrodes, Methodology, Chemicals, On-site investigations, Laboratory tests, Water pollution, Pollutants, Chemistry, Gas-sensing electrodes.

A standard addition technique using a gas-sensing electrode with a modified electrode filling solution provides a rapid and convenient method suitable for both field and laboratory measurement of ammonia. The method has a detection limit of 0.2 micro M of NH3, a precision of + or -0.1 micro M of NH3, and no measurable salt error. Calibration is stable for a period of days, and analytical rates of 15 samples per hour are possible. (Sims-ISWS)

OPTICAL CONSTANTS IN THE INFRARED FOR K2SO4, NH4H2PO4' AND H2SO4 IN WATER,
Missouri Univ.-Kansas City. Dept. of Physics.
M. R. Querry, R. C. Waring, W. E. Holland, L. M. Earls, and M. D. Herrman.
Journal of the Optical Society of America, Vol. 64, No. 1, p 39-46, January 1974. 7 fig, 3 tab, 24 ref. OWRT A-030-MO(5), A-063-MO(2), 14-31-0001-3025, 3225 and 3825.

Descriptors: Infrared, Reflectance, Spectroscopy, Aqueous solutions, Potassium sulfate, Hydrogen sulfate.

Relative, specular reflectances of individual 0.5M aqueous solutions of K2SO4 and NH4H2PO4 and of 3M H2SO4 were measured in the 2-20 micrometer region of the infrared for polarized radiant flux having the electric field vector perpendicular to the plane of incidence. Distilled water was the reflectance standard. The angle of incidence was 70.03 deg + or - 0.23 deg. Kramers-Kronig analysis of the relative reflectance spectra provided phase difference spectra for the aqueous solutions and a tabulation of spectral values relative to air for the index of refraction and extinction coefficient. The strengths of selected infrared bands of the solutes were determined by integrating values for the molecular extinction coefficients over the spectral regions of the bands.

THE GENETIC BASIS OF THE ECOLOGICAL AMPLITUDE OF SPARTINA PATENS ON THE OUTER BANKS OF NORTH CAROLINA.
Duke Univ., Durham, NC. Dept. of Botany.
J. A. Silander, Jr.
PhD Dissertation, 1976. 292 p.

Descriptors: *Marsh plants, *Genetics, *Physiological ecology, Wetlands, Salt marshes, Grasses, *North Carolina, Resistance, Salt tolerance.

Reciprocal and common garden transplantations of Spartina patens genets sampled along a transect of Codd's Creek, North Carolina, were employed in an analysis of evolutionary limits to species distributions. These studies revealed significant divergence among adjacent dune, swale, and marsh subpopulations for a variety of morphometric characters including number and size of fertile and vegetative culms, leaf size, flowering date, and seed production. Significant divergence among subpopulations was revealed in physiological traits. Dune genets were more salt and drought tolerant and elicited a better response to low nutrient conditions. Marsh genets were less salt and drought tolerant and responded better to high nutrients than other genets. Swale genets were intermediate Genetic variance in morphometric and physiological traits decreased slightly from marsh to dune. Gene flow was shown to be restricted among subpopulations as a result of differences in flowering time, selfing, and distance. Some migration was possible, particularly with respect to the swale subpopulation. Nonadaptive correlations were found among some characters under simultaneous selection in different subpopulations. These forces contribute simultaneously to a lower fitness of genets in the swale and dune subpopulations, thereby retarding evolution. (Steiner-Mass)

ENVIRONMENTAL FACTORS LIMITING THE DISTRIBUTION OF FIVE PLANT SPECIES ON SALT MARSHES OF ISLAND BEACH, NEW JERSEY,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Botany.
C. S. Rietsma.
PhD Dissertation, October 1976. 112 p.

Descriptors: *Salt marshes, *Marsh plants, *Ecological distribution, *Limiting factors, Wetlands, Tidal marshes, Coastal marshes, *New Jersey, Distribution patterns, Plant growth, Environmental effects, Environmental gradient, *Island Beach(NJ).

Six communities were distinguished by their respective dominant species: tall growth form of Spartina alterniflora, short growth form of S. alterniflora, Spartina patens, Distichlis spicata, Salicornia virginica, and Juncus gerardi. The level on the marsh at which each community was growing and the duration and depth of tidal flooding in each community was determined. Soil samples were collected during one growing season and determinations made of salinity; moisture content; organic matter content; water soluble chloride, sulfate, sodium, potassium, calcium, and magnesium; exchangeable sodium, potassium, calcium, and magnesium; cation exchange capacity; and acidity. Transplants of S. Patens, D. spicata, S. virginica, and J. gerardi did not survive well when moved into the tall and short S. alterniflora communities. Transplants of tall and short S. alterniflora grew poorly when moved into all communities occurring at higher elevations. Results of this research indicate that soil salinity and moisture may limit the five salt marsh species. S. patens, D. spicata, and J. gerardi may be limited by high salinities early in the growing season at low elevations in the marsh. (Steiner-Mass)

The density current induced by a front which is a transition between well-mixed and stratified water was examined by means of a two-dimensional numerical model. It was shown that this may cause a convergence and upwelling near the front, which could have important biological consequences, together with a flow along the line of the front (Humphreys-ISWS)

An efficient procedure for solving an arbitrary number of coupled, nonlinear, vertically integrated transport equations can be achieved by exploiting unique features of both finite difference and finite element methods. A technique is derived that attains this end, and it is used in a preliminary simulation of a marine ecosystem. The technique is apparently independent of stability criteria, and as a result, the time-step can be determined by the time-scales of the physical and biological processes simulated or by the time-step of a compatible hydrodynamic model. The method does not require linearization of the governing equations, and the biological interaction terms therefore retain their inherent nonlinearity. The computational cost is determined primarily by the physiography of the basin, rather than by the number of component equations. Thus, relatively comprehensive ecosystems can be readily modeled. AN ECOLOGICAL STUDY OF EPIPSAMMIC DIATOMS FROM SEDIMENTS ASSOCIATED WITH JUNCUS ROEMERIANUS IN A NORTHWEST FLORIDA SALT MARSH,
Florida State Univ., Tallahassee. Dept. of Biological Science.
T. L. Hart.
PhD Dissertation, June, 1977. 191 p.

Descriptors: *Salt marshes, *Florida, *Diatoms, Wetlands, Marshes, Sediments, Aquatic microorganisms, Chrysophyta, Organic compounds, Distribution patterns, Growth.

Epipsammic diatoms dominated the sand grain microflora within the maximum quantities of living diatom occurring at the sediment surface. From the surface the number of diatoms per sand grain decreased with depth until a minimum was reached at 5 cm. At this depth and below isolated pockets of diatoms did exist but were few in numbers. Variations in the quantities of living diatoms per sand grain and attached frustules were observed both in the horizontal and vertical planes. Natural communities of epipsammic diatoms induced with glucose took up the substrate at concentrations comparable to the affinity values obtained by laboratory cultures in uptake experiments. Isolated epipsammic diatoms incorporated a variety of organic compounds of heterotrophic growth. Among the 30 compounds tested, 15 were capable of supporting growth in one or more of the seven test diatoms. However, only glucose, lactate, and fructose supported heterotrophic growth in five or more test cultures. The majority of organic compounds were capable of supporting growth in only one or two species with no one species dominant. Eight nitrogen compounds were tested of which only ammonium chloride and gultamate provided nitrogen at an adequate level for growth in all seven species. (Steiner-Mass)

BIRD USE OF ANAHEIM BAY: A SOUTHERN CALIFORNIA SALT MARSH,
California State Univ., Long Beach, Dept. of Biology.
P. D. Romero.
M.S. Thesis, 1976. 174 p.

Descriptors: *Salt marshes, *California, *Birds, *Census, Wetlands, Coastal marshes, Wildlife habitat, Wildlife, Shore birds, Water birds, Rails, Migratory birds, Waterfowl, Animal populations.

A study made of Anaheim Bay, a coastal salt marsh, documented its utilization by resident and migratory birds. Some 123 species of birds were observed in the area. Eighty-three species were censused, and their use of habitats within the bay were analyzed. Anaheim Bay is an important wintering area for shorebirds, waterfowl, and other water-associated birds. Highest bird numbers occurred in late December and lowest in July. Use of habitats within the area was highly dependent on tidal conditions and less so on time of day and on weather conditions. Four endangered species--California Brown Pelican, California Least Tern, Light-footed Clapper Rail, and Belding's Savannah Sparrow--inhabit Anaheim Bay. Four species were found to breed within the marsh. (Steiner-Mass)

SALT MARSHES OF THE ALASKA PACIFIC COAST,
Rutgers - The State Univ., NJ. Dept. of Botany. Newark.
J. H. Crow.
In: Proceedings of the Symposium on Terrestrial and Aquatic Ecological Studies of the Northeast, Andrews, R. D. (ed.). Ecological Society of America and the Northwest Scientific Association, Eastern Washington State College, Cheney, p. 103-110, 1977. 1 fig, 1 tab, 12 ref.

Descriptors: *Salt marshes, *Alaska, Wetlands, Marsh plants, Distribution patterns.

From Juneau to Cook Inlet there are thousands of hectares of salt marshes where human disturbance is uncommon. A few of these marshes extend for more than 50 kilometers along the coastline while hundreds of small marshes cover only a few hectares. Very sharp boundaries exist between nearly all communities and are a characteristic feature of the marshes. Community and species diversity is often high; some communities having 20 or more flowering plant species in a square meter. The marshes are important to many kinds of animals and may serve as useful references in baseline studies. (Steiner-Mass)
W79-02743

THE SALT MARSH VEGETATION OF CHINA POOT BAY, ALASKA,
Rutgers - The State Univ., Newark, NJ. Dept. of Botany.
J. H. Crow, and J. D. Koppen.
In; Environmental Studies of Kachemak Bay and Lower Cook Inlet. Trasky, L., and Burbank, D. (eds.). Alaska Department of Fish and Game, Juneau, Alaska. Vol. II, p 716-744. 1977. 2 fig, 6 tab, 10 ref.

Descriptors: *Salt marshes, *Alaska, *Marsh plants, Wetlands, Distribution patterns, Grasses, Detritus, Marshes, Coastal marshes, Oil waters, *China Poot Bay(Alas).

Over 240 ha of salt marsh exists in China Poot Bay. The great majority of the marshland is covered by grass/succulent vegetation that is subject to frequent inundation by salty water or grows in habitats that accumulate salts. The dominance of Puccinellia hultenii-Comprises appears to distinguish the marshland from other marshes of comparable size that exist along the southcentral and southeastern regions of Alaska. Due to the nature of the vegetation and strong tidal influences, it is believed that oil spill damage in the vicinity of the bay presents a substantial hazard. Tidal removal of litter-detritus from the marsh appeared to be very high. Itj is hypothesized that this may be an important facet ot the highly productive marine ecosystem associated with China Poot Bay. (Steiner-Mass)

A CONCEPTUAL ECOLOGICAL MODEL FOR CHESAPEAKE BAY,
K. A. Green.
U.S. Fish and Wildlife Service, Biological Services Program. FWS/OBS-78/69. September, 1978. 22 p. 8 fig, 39 ref, 3 append.

Descriptors: *Model studies, *Chesapeake Bay, *Carbon cycle, *Cycling nutrients, Structural models, Wetlands, Wildlife, Vegetation, Waste disposal, Water quality.

A conceptual model for the Chesapeake Bay ecosystem (wetlands, tributaries, and bay proper) was developed as an interrelated series of diagrams showing carbon and nutrient pathways. Information was based on an analysis of local literature and discussions with scientists who are studying the Bay. The ecological functions that produce the resources of commercial and recreational fisheries, habitat for migratory birds and other wildlife, waste disposal, and aesthetic water quality are indicated. Physical (light, turbidity, mixing, transport, sedimentation) and chemical (sediment-water interactions, presence of pollutants) aspects of the environment modify the rates of biological processes (primary, production, nutrient regeneration, larval survival). A detailed ecosystem model combining the wetlands, plankton, seagrasses, other benthos, and fish trophic dynamics submodels shows the importance of material transfer and interactions between subsystems. ENERGY FLUX IN A TIDAL CREEK DRAINING AN IRREGULARLY FLOODED JUNCUS MARSH,
Mississippi State Univ., Mississippi State. Dept. of Zoology.
C. T. Hackney.
PhD Dissertation. May, 1977. 83 p.

Descriptors: *Tidal marshes, *Energy transfer, *Productivity, Wetlands, Salt marshes, Coastal marshes, Mississippi, Energy, Detritus.

The flux of suspended organic detritus, floating debris and animal biomass from a Mississippi tidal creek was studied during ten diurnal tidal periods (24 hour) and three semi-diurnal tidal periods (12 hour). There was a net export of floating debris (3.1 kg or 56,875 kj) and animals (0.49 kg or 9,721 kj), but a net import of suspended particulate detritus (38.5 kg or 209,540 kj) during the 13 tidal periods studied. The integration of these data is equal to an annual net import of six million kj or energy equivalent to less than 1% of the total productivity of the marsh. The energy equivalent of the floating detritus varied from 17.15 to 24.36 kj/gAFDW, while the energy equivalent of members of the marsh community varied from 20.32 to 30.49 kj/gAFDW. The concentration of suspended particulate organic detritus was predictable during ebb tide and was dependent primarily on tidal height, season, physical characteristics of the water (temperature, salinity, and dissolved oxygen) and the concentration of the fauna within the creek The concentration of particulate organic detritus

was not predictable during flood tide. (Steiner-Mass)

FACTORS AFFECTING TEMPERATURE AND SALINITY CONDITIONS ON A SCOTTISH SALT-MARSH, WITH NOTES ON THE ECOLOGY OF SPHAEROMA RUGICAUDA (LEACH),
Edinburgh Univ. (Scotland). Dept. of Zoology.
D. J. Heath.
Archiv fur Hydrobiologie, Vol. 75, No. 1, p 76-89, February, 1975. 3 fig, 3 tab, 18 ref.

Descriptors: *Salt marshes, *Salinity, *Water temperature, Wetlands, Estuaries, Marshes, Tidal marshes, Tides, Rainfall, Rivers, Mud, Ecological distribution, Salt tolerance, *Scotland.

Temperature and salinity determinations were made during spring tides over a period of 2.5 years on an estuarine salt-marsh in the Tyne estuary, East Lothian, Scotland. The range of temperature (-2.5 to 22.5 degrees C) and the range of salinity (0.7 to 34.1 ppt) were greater than the ranges reported for other estuaries. Estuarine water temperature showed a greater range than did river water, air, or sea water temperatures. Large expanses of mud in the estuary appear to influence the temperature of the estuarine water, raising it in the summer and lowering it in the winter. Salinity changed rapidly as the tide rose. Salinity at high water was negatively correlated to the flow of water in the river. Periods of heavy rainfall may result in low salinities. Findings are discussed in relation to the published works on the salinity and temperature tolerance of Sphaeroma rugicauda. (Stihler-Mass)
W79-02754

GROWTH, ABUNDANCE AND DISTRIBUTION OF LARVAL TABANIDS IN EXPERIMENTALLY FERTILIZED PLOTS ON A MASSACHUSETTS SALT MARSH,
Marine Biological Lab., Woods Hole, MA. Boston Univ. Marine Program.
R. A. Meany, I. Valiela, and J. M. Teal.
Journal of Applied Ecology, Vol. 13, No. 2, p 323-332, August, 1976. 4 fig, 2 tab, 19 ref.

Descriptors: *Diptera, *Salt marshes, *Massachusetts, *Larvae, Insects, Fertilizers, Sludge, Ureas, Phosphorus, Effects, Life cycles, Foods, Growth rates, Ecological distribution, Wetlands, *Great Sippewissett Marsh(Mass).

Tabanus nigrovittatus and Chrysops fuliginosus, two of the four species of tabanid larvae found Great Sippewissett Marsh, comprised approximately 90% of the total tabanid population. They were both found predominantly in areas where the short form of Spartina alterniflora was the dominant plant. Larval tabanid populations were drastically reduced in plots treated with a sewage sludge fertilizer but were unaffected by treatments with a phosphate and a urea fertilizer. Larval densities were reduced in laboratory experiments from 80-240/ sq m to 40-120 sq through cannibalism. The lower figure approximates the densities found in the field. Summer growth rate is about 4 mm/month. (Stihler-Mass).

ECOSYSTEMS OF THE WORLD 1: WET COASTAL ECOSYSTEMS.
Elsevier Scientific Publishing Co., New York, 1977. 428 p. Edited by V. J. Chapman, University of Auckland, N. Z., Dept. of Botany.

Descriptors: *Wetlands, *Coastal marshes, *Mangrove swamps, *Geographical regions, *Distribution, Salt marshes, Temperate, Subtropical, Climates, Soils, Geomorphology.

Seventeen chapters by 18 authors review coastal wetlands, which comprise marine and brackish slat marshes of temperate regions and mangrove swamps in tropical and subtropical regions of the world. There is a preliminary consideration of the general nature of such wetlands followed by an account of the physiographic conditions under which they may and do develop. This is followed by a general account of the climatic conditions and soils associated with these wetlands, and the fauna to be found in them. Regional wetland sections are covered and the volume closes with an account of the uses to which these wetlands have been and are currently put to and the changes such uses involve. (See W79-02763 thru W79-02779) (Steiner-Mass)
W79-02762

INTRODUCTION; WET COASTAL ECOSYSTEMS,
Auckland Univ. (New Zealand). Dept. of Botany.
V. J. Chapman.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 1-29. 11 fig, 8 tab, 59 ref.

Descriptors: *Wetlands, *Coastal marshes, *Mangrove swamps, *Geographical regions, *Distribution patterns, Salt marshes, Distribution, Climates, Marsh plants, Temperature, Soil types, Silts.

The general distribution of mangrove swamps and salt marsh species/communities is broadly related to seven basic features of the maritime environment: air temperature, protected coastline, shallow shores, currents, slat water, tidal range, and substrate. The most extensive marshes and swamps are associated with regions where there is abundant silt brought down by rivers or where the geological nature of the land makes it subject to considerable erosion that results in much silt suspension. Salt marsh formations are essentially characterized by low-growing flowering herbs, especially grasses. Arising from the relatively small number of species and communities found on the marshes, broad geographical areas can be noted in which there is substantial uniformity in the vegetation. In some cases, subdivision can be based on temperature or upon soil types. Nine major groups of maritime salt marshes are reconizable with 13 subgroups. Mangrove swamp formations are wholly aborescent; however, at the northern and southern limits, the trees become shrubby. Segretation by temperature or soil types is not possible for the swamps--they are more closely related to past geographical spread. Six major groups of mangrove swamps with 11 subgroups are recognizable. (See also W79-02762) (Steinter-Mass)

PHYSIOGRAPHY; WET COASTAL ECOSYSTEMS,
J. A. Steers.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 31-60. 17 fig, 4 tab, 44 ref.

Descriptors: *Salt marshes, *Mangrove swamps, *Geomorphology, Wetlands, Coastal marshes, Tides, Sedimentation, Marsh plants, Channel morphology, Distribution patterns.

An account is given of salt marsh and mangrove swamp physiography, beginning with a discussion of salt marshes in England and Wales and then showing how marshes and mangrove areas in other geographical areas differ. In the early marsh stage, gowth is irregular, plants scattered, and sediments laid down by one tide may be removed by another. The tidal waters ebb and flow as a sheet and in time build up the the margins of the flat and the slightly higher parts of it. These areas increase in elevation and vegetation and begin to expand laterally so that tidal ebb and flow become restricted into vaguely delimited channels. With increasing marsh growth these become more defined and eventually become a creek system which is characteristic of a salt marsh. The factors of marsh development that must be considered for each geographic area are the tides, the type, ad means of sedimentation, the floor on which the sediments rest, the slope of this floor and the irregularities on it, and the type and spread of vegetation. THE COASTAL SALT MARSHES OF WESTERN AND NORTHERN EUROPE: AN ECOLOGICAL AND PHYTOSOCIOLOGICAL APPROACH,
Delta Inst. for Hydrobiological Research, Yerseke (Netherlands).
W. G. Beeftink.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 109-155. 14 fig, 10 tab, 222 ref.

Descriptors: *Coastal marshes, *Europe, Wetlands, Salt marshes, Distribution, Geographical regions, Distribution patterns, Ecological distribution.

An overall view is given of the biotic components of the West- and North-European salt marshes including the Atlantic coasts of the Iberian Peninsula. Attention is focused on the ecological features in pattern and process characteristic of salt marshes, and on their variability within this European coastal region. Remarks are given on the functional relationships within the European salt marsh ecosystem. The marshes are first considered as a border environment and their dominant diagnostics are briefly sketched. Among the organisms, phanerogams and their communities are first discussed, followed by remarks on algal and animal ecology. European salt marshes occupy a minor place in the total coast length. Generally the marshes show a disjunct distribution of limited areas, but on certain coasts they occupy vast parts of the shore. The marshes are found primarily in and around river mouths, but also in bays, Wadden areas, lagoons, and on beach plains protected by sand or shingle spits. (See als W79-02762) (Steiner-Mass)

MANGALS AND SALT MARSHES OF EASTERN UNITED STATES,
Georgia Univ., Brunswick. Marine Resource Extension Center.
R. J. Reimold.
In: Ecosystems of the World 1: Wet Coastal Ecosystems. Elsevier Scientific Publishing Co., New York, 1977, p. 157-166. 1 fig, 4 tab, 74 ref.

Descriptors: *Distribution, *Coastal marshes, *Atlantic Coastal Plain, Wetlands, Salt marshes, Geographical regions, Distribution patterns, Productiv-

ity, Marsh plants, Classification, Georgia, South Carolina.

Along the Atlantic coast of the United States there are some 890,308 ha of wetlands which include 589,480 ha of salt marshes. The distribution by state reveals that the greatest expanses occur along the central and southern reaches of the east coast. South Carolina and Georgia alone contain over 62% of all east coast salt marshes. The marshes have faunal and floral components common over this entire region. Spartina alterniflora, which dominates the intertidal zone, is the characteristic vegetation from eastern Canada to south Florida. It has the greatest productivity in Georgia, 2000-3000 g/aq m/year, and there appears to be a latitudinal variation in primary production. Since it is energy that originates in these primary producers that actually nourishes higher trophic levels in the salt marsh, future quantitative comparisons of salt marshes might best be based on production measurements using standardized techniques. The marshes of eastern North America may be classified as Spartina-Juncus marshes for world-comparative purposes. (See also W79-02762) (Steiner-Mass)
W79-02769

PLANT AND ANIMAL COMMUNITIES OF PACIFIC NORTH AMERICAN SALT MARSHES,
California Univ., Santa Barbara. Dept. of Geological Sciences.
K. B. MacDonald.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 167-191. 8 fig, 2 tab, 151 ref.

Descriptors: *Salt marshes, *Distribution patterns, *Halophytes, *Aquatic animals, *Pacific Coast Region, Wetlands, Marshes, Distribution, Coastal marshes, Marsh plants, Classification, Wildlife habitat, Wildlife, Salinity.

Both the general organization and the faunal composition of middle latitude Pacific salt marsh communities are closely similar to those described in other parts of the world. Shared genera are common and several examples of identical species can be cited. Only a few of the species appear to be restricted to this habitat. Instead, many marine macroinvertebrates represent estuarine genera commonly recorded for subtidal muds, rocky shores, or exposed open beaches. These species rarely penetrate the high marsh. Conversely, terrestrial species common in the high marsh rarely occur in the more frequently submerged low marsh. Among the more mobile salt marsh species, terrestrial forms appear to be both more numerous and diverse than mobile marine macroinvertebrates and fish. Amother taxa characteristic is the low species-diversity-high density population pattern widely regarded as typical of extreme, highly fluctuating physical environments. The vegetation of most of these marshes is dominated by a rather small number of halophytes often less than 10 and only rarely as many as 20 species per site. As salinities decline, as local freshwater sources appear, or as human disturbance increases, maritime, upland, or weedy species appear and the diversity of the marsh flora rapidly increases. W79-02770

TIDAL SALT-MARSH AND MANGAL FORMATIONS OF MIDDLE AND SOUTH AMERICA,
Louisiana State Univ., Baton Rouge.
R. C. West.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 193-213. 16 fig, 1 tab, 92 ref.

Descriptors: *Salt marshes, Mangrove swamps, *Atlantic Coastal Plain, *Pacific Coastal Plain, *Gulf Coastal Plain, *Distribution patterns, Wetlands, Tidal marshes, Coastal marshes, Marshes, Swamps, Distribution, Halophytes, Marsh plants, Ecological distribution, Gulf of Mexico, Louisiana, Sites.

Along the northern coast of the Gulf of Mexico, salt marshes are best developed on the fringes of the inactive Mississippi River delta and the coastal plain of Louisiana. More than three-fourths of the total salt marsh acreage along the Gulf Coast, and half of the total U.S. acreage, occurs there. In floristic composition and succession, they are closely related to those of the Atlantic coast with Spartina, Juncus, and Distichlis as dominants. The dominance of cliffed coasts, extensive sand beaches, and dume fields have limited tidal marshes along the Atlantic from southern Brazil to Tierra del Fuego to relatively small deltaic plains and river mouths. On the pacific side, marshes are confined to small disjunct inlets along the southern and central coast of Chile. South American species of Spartina, Distichlis, Juncus, and Salicornia dominate north of approximately 44 degrees S. South thereof, low salt tolerant shrubs become dominant as Spartina and other salt grasses rapidly decline in abundance. Tropical salt marsh formations are usually limited in extent because of competition with mangrove species. On the Atlantic, mangroves extend from the tip of Florida to southern Brazil. On the Pacific, they range from northwestern Mexico to the Peruvian-Ecuadorian border. (See also W79-02762) (Steiner-Mass)
W79-02771

AFRICA A. WET FORMATIONS OF THE AFRICAN RED SEA COAST,
Mansoura Univ. (Egypt). Dept. of Botany.
M. A. Zahran.
In:Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p 215-231. 6 fig, 1 tab, 49 ref.

Descriptors: *Salt marshes, *Mangrove swamps, *Red Sea, *Distribution patterns, *Sites, Wetlands, Coastal marshes, Marshes, Swamps, Halophytes, Marsh plants, Ecological distribution, Cattails, Classification.

The wet formations of the African Red Sea coast are comprised of mangrove swamps, reed swamps, and salt marshes. The mangrove vegetation, dominated by Avicennia marina, is well developed along the entire coast. The reed swamp vegetation, dominated by Phragmites australis and Typha domingensis, is distributed along the entire coast in limited patches where the soil is relatively less saline and the water not too shallow. The initial salt marsh vegetation comprises 23 principal community types. These may be ecologically classified into two main groups: communities of the saline flats and communities of the piled sand. the communities, even those which are ecologically and morphologically similar, are scattered in their geographical distribution. Vegetative zonation is complete only where the shore rises gently and gradually into the land, and this occurs rarely. The topography of the salt marsh comprises different types of shoreline bars, and its ground may be studded by mounds and hummocks of various dimensions. (See also W79-02762) (Steiner-Mass)
W79-02772

AFRICA B. THE REMAINDER OF AFRICA: WET COASTAL ECOSYSTEMS,
Auckland Univ. (New Zealand). Dept. of Botany.
V. J. Chapman.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p 233-240. 6 fig, 1 tab, 27 ref.

Descriptors: *Salt marshes, *Mangrove swamps, *Distribution patterns, *Sites, *African, Wetlands, Coastal marshes, Marshes, Swamps, Marsh plants, Halophytes, Ecological distribution.

The locations and major vegetative dominants are given of the salt marshes and mangrove swamps of the African coast. Along the North African coast Juncus acutus salt marsh communities frequently occur where there is high water moisture, salt and good drainage. Less saline areas on the landward side are occupied by Tamarix africana. Mangrove swamps predominate along West Africa with only a few isolated patches of salt marsh. Mangroves predominate along the East African coast, especially in the estuaries and along the offshore coral reefs. Temperatures along the South African coast are too cool for mangroves and the wet coastal formations are salt marshes. (See also W79-02762) (Steiner-Mass)
W79-02773

OUTLINES OF ECOLOGY, BOTANY AND FORESTRY OF THE MANGALS OF THE INDIAN SUBCONTINENT,
Centre National de la Recherche Scientifique, Toulouse (France). Inst. de la Carte Internationale du Tapis Vegetal.
F. Blasco.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p 241-260. 4 fig, 2 tab, 70 ref.

Descriptors: *Mangrove swamps, *Distribution patterns, Wetlands, Ecological distribution, Sites, Deltas, Halophytes, Vegetation regrowth, Marsh management.

In the Indian territory, the mangrove swamps cover over 350,000 ha. Of this wooded area 85% lies in the Gangetic Delta and in the islands of the Bay of Bengal. In the other deltas, the mangroves, affected by an overhigh population density and excessive grazing, are highly degraded and are not of economic importance unless scientific forest management and pisiculture are undertaken. Practically every delta has a forest with distinct ecological and botanical traits. The total halophytic flora is rich; 58 major species have been enumerated. At present the more common species of the Indian mangroves are an aborescent member of the Euphorbiaceae, Excoecaria agallocha, and diverse species of Avicennia. These species have a great ecological amplitude and faculty for vegetative regeneration. The Rhizophora species, which show a poor resistance against strong biotic pressures, have become rare and have disappeared or tend to disappear, except in the Cauvery Delta and the Audaman Islands. W79-02774

WET COASTAL FORMATIONS OF INDO-MALESIA AND PAPUA-NEW GUINEA,
Auckland Univ. (New Zealand), Dept. of Botany.
V. J. Chapman.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p 261-270. 7 fig, 36 ref.

Descriptors: *Mangrove swamps, *Distribution patterns, Wetlands, Estuaries, Herbicides, 2,4-D, Ecological distribution, Sites, Crabs.

In Malaya the most extensive mangrove swamp forests are found in the Riau Islands south of Singapore, on the eastern shore of Sumatra, the southern and western shores of Borneo, and the southern coast of New Guinea. A number of rivers in the region are substantial with their lower reaches flowing over an extensive lowland. Tidal influence and mangroves can therefore extend up to 130-320 km inland. The community distribution in Indo-Malesia depends largely on physiography, salinity, soil type, degree of exposure, and drainage with frequency of inundation, age of swamp, and light as less signficant. On the Vietnamese coast, extensive mangrove swamps are found and are estimated to occupy 2800 sq km. The fauna is dominated by crabs present in large numbers which affect mangrove regeneration. With increase in latitude, mangrove species gradually disappear until only Kandelia candel remains in southern Japan. The various mangrove species in Vietnam have all proven susceptible to defoliation by a mixture of 2,4-D and Picloran. The sprayed may remain uncolonized for up to six years. Possible causes in delayed regeneration are: crab predators of seedlings, compaction of the soil after death of trees, or actual lack of seeding colonizers. (See also W79-02762) (Steiner-Mass)
W79-02775

MANGALS OF MICRONESIA, TAIWAN, JAPAN, THE PHILIPPINES AND OCEANIA,
Kyushu Univ., Fukuoka (Japan).
T. Hosokawa, H. Tagawa, and V. J. Chapman.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p 271-291. 12 fig, 10 tab, 70 ref.

Descriptors: *Mangrove swamps, *Distribution patterns, Wetlands, Estuaries, Ecological distribution, Sites, Coasts, Islands.

Mangrove swamps in Micronesia are not as extensive or well developed as those in the subtropical region further west. Considerable areas around all the high coastline, with large swamps in estuaries and filled lagoons. In Oceania, the development of mangroves is strictly influenced by the direction of the prevailng wind, the widest belts occur on the leeward coast and the narrowest on the windward coast of the island. Mangrove vegetation in Taiwan has generally developed in localities of quite seasonally dry climate, mainly in three sites along the northern and southwestern parts of the coast. The islands of Nansei-shoto of southwest Japan form stepping stones for mangroves from tropic Asia to the warm temperate region of Kyushu in Japan. The areas occupied by the mangrove forests and the diversity of species composition decrease with increasing latitude. At the northern limit and in adjacent areas, mangrove is represented by a stand of one species Kandelia candel. The mangrove ecosystems in Polynesia are essentially similar in their composition, but do not achieve extensive status. (See also W79-02762)(Steiner-Mass)
W79-02776

MANGAL AND COASTAL SALT-MARSH COMMUNITIES IN AUSTRALIA,
Queensland Univ., Brisbane (Australia). Dept. of Botany.
P. Saenger, M. M. Specht, R. L. Specht, and V. J. Chapman.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 293-345. 16 fig, 14 tab, 256 ref.

Descriptors: *Mangrove swamps, *Distribution patterns, *Salt marshes, Wetlands, Estuaries, Ecological distribution, Sites, Tidal marshes, Coastal marshes, Marshes, Marsh plants, Halophytes.

Mangorve vegetation is found around the coasts of all mainland states of Australia. In both species diversity and extent, the mangrove complex shows greatest development in northern tropical Australia where there are 27 tree species. Progressively fewer species, occupying smaller and smaller areas of the landscape, are found in the subtropical region, while only one specie, Avicennia marina, extends into the temperature region. Mangrove vegetation in New Guinea shows an even richer flora with the forests often reaching 30m or more in height. The large concentration of mangrove species and associated plants in the northwestern area of Australia can be attributed to three factors: this region was the origin of dispersal, the climatic region approximates that under which the mangrove vegetation first developed, and numerous estuaries provide large areas suitable for growth. Tidal salt marsh vegetation in contrast to mangrove vegetation, becomes increasingly more complex in structure and contain more species as latitude increases from tropical to temperate. Most dominant Australian salt marsh species have a wide geographical range, while a number, usually understory species, are confined to the temperature region. (See also W79-02762) (Steiner-Mass)

EXPLOITATION OF MANGAL,
Environmental Research Lab., Gulf Breeze, FL.
G. E. Walsh.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 347-362. 9 tab, 178 ref.

Descriptors: *Mangrove swamps, *Fish farming, *Economics, Land use, Wetlands, Estuaries, Productivity, Natural resources, Timber, Pulp and paper industry, Georgia, Publications, Forest management.

A literature review is made of the economic and ecological values with man's uses of mangrove swamps. Mangrove forests are among the most productive estuarine ecosystems, fixing as much energy as other estuarine systems, eutrophic ponds, evergreen forests, or good farmland. The stands serve as nurseries and food sources for many game and food fish. An acre, 0.405 ha, of undisturbed estuary yields an estimated $7,980 worth of commercial fish products in 20 years. The value of the Alcony River Swamp in Georgia, 930 ha in area, exceeds over seven million dollars a year in fisheries resources. For every acre of estuary filled or dredged, two additional acres are lost to fish production, yielding a total capitalized loss of $23,940 during 20 years. The mangrove forest is of considerable importance, not only as a source of firewood, charcoal, timber, and tannin, but also as a shoreline stabilizer. A recent development in mangrove utilization has been production of high-alpha pulps for the manufacturing of rayon, cellophane, lacquers, cellulose acetate, and other cellulose derivatives. HUMAN USES OF SALT MARSHES,
Maryland Univ., College Park. Chesapeake Research Lab.
W. H. Queen.
In: Ecosystems of the World 1: Wet Coastal Ecosystems, Elsevier Scientific Publishing Co., New York, 1977, p. 363-368. 29 ref

Descriptors: *Salt marshes, *Economics, *Marsh management, Wetlands, Coastal marshes, Fish management, Productivity, Shellfish, Commercial fisheries, Wildlife habitat, Waste water treatment, Estuaries, Marsh plants, Erosion control.

Present calculations of marsh value emphasize natural characteristics and processes revealed by ecological studies over the past several decades. These characteristics and processes many be grouped into four categories: biological production, aquaculture, waste-water assimilation, and other uses. Biologically, estuaries bordered by marshes, and coastal waters in the vicinity of extensive marsh-estuarine systems, are among the world's most productive waters in terms of both commercial and sport fisheries. Both estuarine shellfish and many coastal water finfish are doubly dependent on coastal salt marshes. Of equal importance with the habitat role is the function of marshes as producers of nutrient material, especially organic material. Economic demand has stimulated interest in increasing fish and shellfish production in estuarine waters by the use of aquaculture techniques. Althouh these techniques represent commercial exploitation of marshes, they are dependent upon the production of organic nutrients by marsh plants, a natural marsh process. Waste water assimilation by marsh plants has led to considerable speculation that marshes can be used to partially purify domestic waste water thereby reducing the need for tertiary sewage treatment. Other marsh characteristics useful to man are erosion control, prevention of damage resulting from tidal flooding, and the cycling of nitrogen and sulphur. (See also W79-02762) (Steiner-Mass)

ENVIRONMENTAL STUDIES OF KACHEMAK BAY AND LOWER COOK INLET, VOLUME VI: FOOD HABITS OF SHRIMP IN KACHEMAK BAY, ALASKA,
Rutgers - The State Univ., NJ. Dept. of Botany.
J. H. Crow.
Alaska Department of Fish and Game, Marine/Coastal Habitat Management, 33 p, 1977. 2 fig, 10 tab, 18 ref.

Descriptors: *Shrimp, *Alaska, *Food habits, Organic matter, Wetlands, Marshes, Diatoms, Algae, Crustacean, *Kachemak Bay(Alas), *Lower Cook Inlet(Alas).

Examination of the stomach contents of Pink, Coonstripe, and Sidestripe shrimp revealed that amorphous organic matter (detritus) and algae, mostly diatoms and fragments of macroalgae were the principal food sources. The stomachs also contained substantial amounts of invertebrate parts and grit; the former was mostly lacking protoplasm and probably of secondary importance as an energy source. The shrimp are apparently ingesting matter at or near the bottom since plankton samples taken concurrently did not correspond with stomach contents. Most of the diatoms and some of the macroalgae found in the stomachs are associated with the marsh-mudflat areas that are well represented in Kachemak Bay. (Steiner-Mass)

THE ECOLOGY OF PALAEMONETES PUGIO IN A SOUTHEASTERN SALT MARSH ECOSYSTEM WITH PARTICULAR EMPHASIS ON PRODUCTION AND TROPHIC RELATIONSHIPS,
South Carolina Univ., Columbia. School of Marine Science.
W. B. Sikora.
PhD Dissertation, 1977. 121 p.

Descriptors: *Salt marshes, *Shrimp, *Animal populations, Wetlands, Tidal marshes, Coastal marshes, Aquatic animals, Crustaceans, Growth rates, Aquatic habitats, Southeast U.S.

Grass shrimp, Palaemonetes pugio, populations of three salt marsh tidal creeks were sampled qualitatively and quantitatively and a population model was constructed to quantify the population dynamics over an annula cycle. Size-cohort analysis of the multivoltine, epibenthic adult population was undertaken to assess the growth, recruitment, and mortality and incorporate these data in the production model. Peak abundance was found to occur in late fall and the lowest numbers in late spring. Two spawning periods per year were found with the individual life span being less than one year. Growth rates over time and size classes were quite constant. Total annula egg production was 9.2% of the total annual production of females. Production of males, females and eggs was estimated by monthly intervals over an annual cycle. The subadult and adult stages of the shrimp were found to utilize an intertidal habitat. The tidal migrations of the shrimp were measured. By combining tidal data with shrimp migration data, an estimated of habitat utilization was obtained which indicated the shrimp spend most of the time within the intertidal creek bank area. Descriptors: *Alkaline water, *Hydrogen ion concentration, *Beaches, On-site investigations, On-site data collections, Laboratory tests, Shores, Alkalinity, Sediments, Water chemistry, Light, Temperature, Water temperature, Correlation analysis, Data processing, Fluctuations, *Bermuda.

Unusually high pH values up to 9.6 measured during low tide in a calcareous sandy beach were correlated with high in situ temperatures. Daily flucutations of up to 1.5 pH units are limited to the topmost layer of sediment. Light, by controlling photosynthesis, is the causal factor in determining high pH at the surface; subsurface sediments do not respond to experimental light changes. Indications of such fluctuations are lacking in the litera-

ture. These fluctuations could influence community respiration. (Sims-ISWS)

E. S. Posmentier, and R. W. Houghton.
Journal of Geophysical Research, Vol. 83, No. C10, p 5135-5138, October 20, 1978. 6 fig, 7 ref. ERDA EY76-S-02-2186.

Descriptors: *Stability, *Sea water, *Continental shelf, *Diffusion, *Atlantic Ocean, Salinity, Temperature, Water temperature, Density, Continental slope, Mixing, Salts, On-site investigations, On-site data collections, Data processing, Analytical techniques, Oceans, Oceanography, *New York bight.

Intervals of negative stability were observed which appear as part of distinct loops in the T-S diagram of CTD hydrographic stations near the shelf break in the New York Bight. These features occur within the shelf break frontal zone, which is associated with active interleaving between warm, salty slope water and cooler, fresher shelf water. Double-diffusive mixing was proposed as the mechanism responsible for the observed T-S correlations. (Sims-ISWS)

Marine Biology, Vol. 40, p 341-353, 1977. 1 fig, 10 tab.

Descriptors: Marshes, *Detritus, *Copepods, Marsh production, Estuaries, Nutrients, Estuarine animals, *Marsh plants, Food chains, Carbon balance.

A variety of detrital foods derived from marsh plants were fed to the copepods Eurytemora affinis and Scottolana canadensis. The copepods did not survive well or produce eggs when feeding on detritus with smaller amounts of microbiota, but did well when a rich and abundant microbiota was present. Ciliated protozoans appear to be particularly important in the transfer of detrital energy to copepods.

A. M. Bevercombe, N. Cox, M. P. Thomas, and J. O. Young.
Archiv Hydrobiologie, Vol. 71, No. 4, p 487-516, 1973. 6 fig, 5 tab, 50 ref.

Descriptors: *Wetlands, *Zooplankton, *Benthic fauna, Dunes, Invertebrates, Aquatic animals, Drought tolerance.

Geographical, physical, and chemical data from Massam's Slack--a wet dune slack subject to periodic drying out--are given and the seasonal abundance and distribution of the zooplankton and zoobenthos is described. The species of zooplankton occurring in the slack are typical of shallow waters containing abundant vegetation. Most of the species present, however, have minor differences in life history depending on whether they occur in the slack pool or skirting drainage ditch. The zoobenthos is divided into three groups: animals which survive and multiply while conditions are favorable but perish when drought occurs; animals which leave the slack when conditions become dry; and animals capable of surviving a period of drought. HYDRODYNAMIC TRANSPORT PHENOMENA IN ESTUARIES AND COASTAL WATERS. SCOPE OF MATHEMATICAL MODELS,
Waterloopkundig Lab., Delft (Netherlands) and Rijkswaterstaat, Rijswijk (Netherlands). Data Processing Div.
C. B. Vreugdenhil, and J. Voogt.
Presented at ASCE Symposium on Modeling 75, held in San Francisco, CA, on 3-5 September, 1975. Publication no. 155, December 1975. 1 fig, 26 ref.

Descriptors: *Estuaries, *Coasts, *Hydrodynamics, *Turbulent flow, *Water quality, Mathematical models, Water transport.

An analysis is given of the assumptions in different types of mathematical models for the transport of water and other quantities in estuaries and coastal waters. The starting point is formed by the equations for three-dimensional turbulent flow. An estimate of the importance of various terms is given. By several averaging processes, increasingly simpler models are obtained, but the interpretation of coefficients becomes increasingly more difficult. Also the numerical possibilities are discussed, with special emphasis on aspects of accuracy and nonlinear stability which are considered the most important numerical problems. Attention is limited to nearly horizontal flow, although the influence of short waves on these flows is also treated. In the discussion the parallel between momentum and mass transfer (hydrodynamics and water quality) is taken into account. (Sinha - OEIS)

CORRELATIONS OF FISH CATCH AND ENVIRONMENTAL FACTORS IN THE GULF OF MAINE,
Bedford Inst. of Oceanography, Darthmouth(Nova Scotia). Marine Ecology Lab.
W. H. Sutcliffe, Jr., K. Drinkwater, and B. S. Muir.
Journal of the Fisheries Research Board of Canada, Vol. 34, p. 19-30, 1977. 62 ref.

Descriptors: *Commercial fish, *Commercial shellfish, *Water temperatures, *Fluctuations, Fish

management, Correlation analysis, *Environmental effects, *Marine fisheries, Maine, Air temperature, Atlantic Ocean, Fishing effort, St. Lawrence River discharge, Catch prediction, Marine environment, *Gulf of Maine.

In an investigation of catches of 17 commercial marine species of fish and shellfish from the Gulf of Maine, 10 showed statistically significant correlations with sea temperatures at St. Andrews, N.B., or Boothbay Harbour, Maine. Most fish records contained at least 40 yr. of data. Descriptive equations are produced for four species based first on the correlation between catch and sea temperature and second on the correlation between catch and sea temperature allowing for fishing effort. Inclusion of fishing effort, improved the correlations for all of the species examined. The equations permitted the 'prediction' of later parts of the records from earlier parts. Considering the fish species collectively, the Gulf of Maine system from 1940 to 1959 appeared to be in equilibrium with litle fluctuation in the total commercial biomass. The large fluctuations in individual species abundance are interpreted as resulting from a combination of fishing pressure and to a significant degree oceanic climate as represented by sea temperature. The small fluctuations in the total biomass displays the species variation, with their differing climatic 'preferences,' as well as possible predator (including man)-prey relationships. Environmentally imposed patterns underlie at least 50% of the fluctuations in catch of many species and the understanding of these fluctuations is basic to effective management. (Katz)

HIGH-MAGNESIUM CALCITE OOIDS FROM THE GREAT BARRIER REEF,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia).
J. F. Marshall, and P. J. Davies.
Journal of Sedimentary Petrology, Vol. 45, No. 1, March 1975, p 285-291, 5 fig, 13 ref.

Descriptors: *Petrology, *Sedimentary petrology, Sediments, Petrofabrics, Magnesium compounds, Magnesium, Calcite, *Australia, X-ray analysis, *Ooids, *Great Barrier Reef.

Ooids are repoted from the Great Barrier Reef as occurring over an area of 340 sq km as unconsolidated sediments in water depths of 100-120 m. There is no direct evidence on the age of the ooids but some circumstantial evidence points to an early Holocene age. X-ray diffraction analysis and electron probe studies indicate that they are composed of high-magnesium calcite. The ooids show well defined concentric, radial, and granular fabrics with all three fabric types occurring in the cortex developed around polycrystalline nuclei. Two possible alternatives for the origin of the ooids are suggested: either they were precipated originally as aragonite and have been subsequently replaced by high-Mg calcite, or they were precipated originally as high-Mg calcite. Evidence for the two hypotheses is discussed. (Chilton-ORNL)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DEVELOPMENT OF A 50,000 GPD SEAWATER REVERSE OSMOSIS PILOT PLANT BASED ON CELLULOSE TRIACETATE HOLLOW FINE FIBERS,
Dow Chemical U. S. A., Walnut, CA. Western Div. Research Labs.
R. D. Ammons.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 158, Price codes: A12 in paper copy, A01 in microfiche. Final Report, OWRT/S--78/9, September 1978. 270 p, 33 fig, 20 tab, 5 append. OWRT/S--78/9(No. 3188)(1).

Descriptors: Sea water, *Desalination, *Membrane processes, *Reverse osmosis, Membranes, Filtration, Cellulose triacetate hollow fibers, Pilot plants, Economics, Wrightsville Beach Test Facility(NC), Pretreatment studies, Diatomaceous earth filtration.

The objectives were to develop a commercially attractive seawater desalting module based on cellulose triacetate hollow fine fibers, determine the level of pretreatment necessary to maintain good module performance, and demonstrate the economics and feasibility of reverse osmosis for seawater desalinatin by constructing and operating a 50,000 GPD pilot plant at the Wrightsville Beach Test Facility. Development and testing of eight-inch (2500 GPD) modules was highly successful, and the product water cost ($3.40-$4.00 per 1000 gal. based on three-year membrane life) was low enough to assure that reverse osmosis will gain acceptance in seawater desalting. An expanded pretreatment study became necessary and resulted in development of diatomaceous earth filtration as an economically competitive and technically superior alternative to sand filtration for pretreating feedwater. Development of a larger reverse osmosis module was not commercially successful,but the ground work was laid for future work.
W79-02676

DESALINATION TECHNOLOGY TRANSFER CENTER,
Fairleigh Dickinson Univ., Teaneck, NJ. Coll. of Science and Engineering.
R. Bakish.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 478, Price codes: A02 in paper copy, A01 in microfiche. Final Report, August 31, 1978. 11 p, 1 larg. diag. OWRT T-0018(No. 7704)(1).

Descriptors: Desalination, *Technology transfer, Desalination apparatus, *Virgin Islands, *Desalination plants, Information exchange, Waste water treatment.

A Desalination Technology Transfer Center was established at the West Indies Laboratory of Fairleigh Dickinson University. Surplus equipment from OWRT's facilities in Wilmington, N. C. was moved to St. Croix and installed in specially constructed 30-by 60-ft partially roofed concrete pad. Water intake to feed the system was installed as was a new power supply line to serve the system. In addition, complete pretreatment train was placed in service suitable for use in demonstration, research and development. The system has the capability of feeding up to four 1500 gpd RO modules. At time of completion of the contract the system was capable of feeding the RO modules with water with silting density index lower than 3.

3B. Water Yield Improvement

WEATHER MODIFICATION ACTIVITIES IN TEXAS, 1974-77.
Texas Dept. of Water Resources, Austin. Weather Modification and Technology Section.
Report 219, August 1978. 85 p, 35 fig, 27 tab.

Descriptors: *Weather modification, *Cloud seeding, *Projects, *Texas, Precipitation(Atmospheric), Rainfall, Rain, Hail, Silver iodide, Aircraft, Contracts, Administration, Legal aspects, Permits, Weather, Cloud physics, Meteorology, Water resources.

The State of Texas joined a number of other states which enacted weather modification legislation during the 1960's with enactment in 1967 of the present Texas Weather Modification Act. Under provisions of this Act, the Texas Water Development Board was charged with the administration of the Act. Effective September 1, 1977, Texas' three water resources agencies, the Texas Water Rights Commission, the Texas Water Development Board, and the Texas Water Quality Board, were consolidated to form the Texas Department of Water Resources. The authority for regulating weather modification activities in Texas was transferred to the new Department on that date. An outstanding feature of the authority given the Department by the Act relates to a weather modification license and permit system. The Act requires that potential weather modifiers first obtain a license and a permit before beginning a project. This report described those activities which were conducted during the period 1974-77 under licenses and permits. No attempt was made in this report to analyze the degree of success or failure of these activities. The great variability of natural weather phenomena in Texas makes results extremely difficult to ascertain. A number of years is usually required before the results of a particular program can be determined. (Sims-ISWS)

WATER CONSERVATION INFORMATION DISSEMINATION DURING THE 1977 DROUGHT EMERGENCY,
Utah Center for Water Resources Research, Logan
L. D. James, and W. H. Andrews.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 474, Price codes: A13 in paper copy, A01 in microfiche. Utah Water Research Laboratory, Water Resources Planning Series Report P-78-002, June 1978. 235 p, 27 tab, 3 append. OWRT T-0021(7706).

Descriptors: *Droughts, *Water conservation, Range management, *Water harvesting, Water reuse, Groundwater mining, Irrigation, Erosion, *Information exchange, *Information dissemination, Water distribution(Applied), Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

As drought conditions in 1976 and 1977 became increasingly severe throughout the west and affected many other parts of the country, many states began special drought information dissemination efforts. This study was organized to provide a forum for the exchange of information among the respective states that could reduce duplication among independent efforts. The project collected information on: (A) Water-user conservation practices, (1) domestic use, (a) inside use, (b) outside use, (2) industrial, (3) commercial, and (4) irrigation; (B) Water-supplier management practices, (1) water conservation inducements, (2) emergency supply augmentation, (a) groundwater mining, (b) water harvesting, (c) water reuse, (3) reallocation among uses or users; (C) special drought problems, (1) livestock and range management, (2) effects on fish and wildlife, (3) fire danger, (4) effects on recreation, (5) energy effects (reduced generation and additional use), (6) effects of resulting changes in water quality including salinity, and (7) wind erosion. Types of information included (1) research results contributing to dealing more effectively with emergency drought situations, (2) research currently underway, (3) brochures or other material prepared for public distribution, (4) reports of extension agents or other technical personnel working with the public to solve drought problems, and (5) user or expert statements recommending supplementing or revising any of the above. This report contains 667 abstracts and a snythesis of the information obtained on each topic.

RESPONSES OF BERMUDAGRASS TO SALINITY,
California Univ., Riverside. Dept. of Plant Sciences.
R. C. Ackerson, and V. B. Youngner.
Agronomy Journal, Vol. 67, No. 5, p 678-681, September-October 1975. 6 tab, 27 ref.

Descriptors: *Bermudagrass, *Crop response, *Salinity, Turf grasses, Turf, *Salt tolerance.

Bermudagrasses are salt-tolerant grasses valuable for forage and turf. Experiments were conducted to determine specific responses to increasing salinity to provide a basis for breeding of more salt tolerant, agronomically desirable strains. The cultivar 'Santa Ana' was grown in solution cultures containing increasing levels of NaCl and CaCl2 or K2SO4. Dry weight of tops decreased while dry weight of roots and total nonstructural carbohydrate concentrations of crowns, but not roots, increased with increased salinity of the culture solution. A PROCEDURE TO DETERMINE DIRECT DIVERSIONS FROM LAKE MICHIGAN,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
J. W. Male, and K. Soliman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 365, Price codes: A04 in paper copy, A01 in microfiche. University of Illinois Water Resources Center, Urbana, Research Report No. 137, October 1978. 71 p, 8 fig. 12 tab. 3 ref. S-061-ILL.

Descriptors: *Mathematical models, *Optimization, Water utilization, Regulated flow, Diversion, Flow augmentation, Decision making, Water management, Water resources, Water quality, *Lake Michigan, *Diversion, *Illinois, *Algorithms.

Illinois diverts water from Lake Michigan to the Chicago River and Canal System in three primary ways: (1) diversions for municipal water supply, (2) storm water diverted away from the lake, and (3) direct diversions primarily for water quality purposes. The U.S. Supreme Court has ruled that the total average diversion must not exceed 3200 cfs. Since the stormwater diversion is uncontrollable, by reducing the amount necessary for direct diversion, the diversion available for municipal use can be increased. An optimization procedure, utilizing an efficient network algorithm, is developed to determine the average monthly flowrates at the three diversion points on Lake Michigan. The algorithm minimizes the total amount diverted that is necessary to maintain the dissolved oxygen standard in the waterway system. The procedure is applied to evaluate direct diversion needs under existing conditions and after installation of ten instream aeration stations. Results show the need for large diversions during the summer months and primarily at one diversion point. The installation of instream aerators reduces the need for direct diversions by approximately 25 percent.

IRRIGATION OF URBAN LAWNS,
Colorado State Univ., Ft. Collins. Dept. of Agricultural and Chemical Engineering.
P. M. Haw.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 393, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, Spring 1978. 80 p, 7 fig, 8 tab, 25 ref, 2 append. OWRT B-035-WYO(3).

Descriptors: Irrigation, *Evapotranspiration, Urban lawns, *Lawn irrigation, Sprinkler irrigation, *Lysimeters, Measurement, Cities, *Urbanization, Water utilization, *Colorado.

Using small weighable lysimeters, evapotranspiration of urban lawns was measured in Fort Collins and Northglenn, Colorado during the summer of 1977. The measured data were compared with the Modified Blaney-Criddle equation estimated evapotranspiration lower than the measured data. The Jensen-Haise equation predicted weekly evapotranspiration reasonably well, provided allowance was made for plant stress, growth stage and availability of water after an irrigation. Lawn irrigation practices of the residents of 57 homes in Fort Collins and Northglenn were studied in the summer of 1977. The water applied to the lawns and gardens of these homes was measured. The total water supplied to 30 homes in Northglenn was also measured. Lawn water application rates were compared to: (1) measured evapotranspiration; (2) physical appearance of lawns, and (3) total residential water use. Recommendations are made concerning lawn water application rates in Denver and the use of small lysimeters and water meters in urban lawn studies. These recommendations are: (1) investigate the accuracy of using shallower lysimeters than were used in this study, (2) determine lawn sizes and outside water use patterns more accurately, and (3) compile an instruction manual for urban lawn irrigation.

ENERGY RESOURCES DEVELOPMENT, (COLORADO RIVER BASIN),
Department of the Interior, Washington, DC.
J. Carter.
In: Values and Choices in the Development of the Colorado River Basin, edited by D. F. Peterson and A. B. Crawford, p. 144-155, 1978. University of Arizona Press, Tucson. 1 fig, 1 tab.

Descriptors: *Energy, *Colorado River basin, *River basin development, Fossil fuels, Coals, Oil shales, Solar energy, Geothermal energy, Economics, Government, Hydroelectric power, Energy budget, Economic impact, Economic justification, Economic feasibility, Political constraints, Water resources development.

Projections for future energy needs have led to increased interest in the energy resources of the Colorado River Basin. Accordingly, the U. S. Department of the Interior has created an energy policy for future development by encouraging coal and oil shale technology and resources data throught leasing programs and r and d projects. Although solar, geothermal, coal, and oil shale development of the area is expected, it is this author's contention that these efforts, along with conservation programs, will not greatly alter the energy situation sufficiently to avoid an increased dependence on foreign sources by 1980. Even though oil, gas, and hydroelectric power is available in the Basin, developmental and environmental problems make it doubtful that these resources will be a major source of energy for the next several

years. The Federal Government, nevertheless, is moving quickly to faciliate the development of the region's energy resources at acceptable economic and environmental costs, regardless of the difficulty of the decisions that must be made. Water, costs, and socioeconomic problems of the Basin's development form the basin of this discussion. (See also W79-02732). (Tickes-Arizona).

PROBABILISTIC ANALYSIS OF WATER AVAILABILITY IN POWER PLANT SITE SELECTION,
Arizona Univ., Tucson. Dept. of Nuclear Engineering.
D. M. Wong.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 407. Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, 1974. 63 p, 13 ref, 2 append. OWRT A-043-ARIZ(2), 14-31-0001-4003.

Descriptors: *Cooling water, Information retrieval, *Nuclear powerplants, Water reuse, *Probability, *Sites, *Powerplant site selection, Water supply, Water availability, *Forecasting, *Arizona, Groundwater basins, Water demand, Projections, Southwest U.S.

A method of probabilistic analysis of long-term water availability for power plant site selection was developed. A standard site selection process was followed, in which the factors affecting siting were identified, weighted by their importance, and compared by location, the basic techniques being the system screening and ranking processes. The potential physiographic/groundwater basins were initially screened with reference to specific site selection requirements. Then a probabilistic value predicting water availability of sufficiency was obtained, by (1) estimating and projecting the quantity of water available in each candidate valley for the lifetime of the plant (assumed to be 30 years) by a probabilistic mathematical model; and (2) calculating the total quantity of cooling water required for the lifetime of the plant, by estimating the annual cooling demand assuming a 1000 MWe light water reactor power plant design. Twenty-four groundwater basins in Arizona were listed as potential areas where groundwater storage may be sufficient as a source of supply for the projected 30-year life of a power plant. After screening with respect to land availability and seismic characteristics, the list was reduced to seven basins or valleys, of which three were then selected arbitrarily for detailed examination.
W79-02834

3F. Conservation In Agriculture

ASSESSING THE SPATIAL VARIABILITY OF IRRIGATION WATER APPLICATIONS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
D. Karmeli, L. J. Salazar, and W. R. Walker.
Publication No. EPA-600/2-78-041, March, 1978. 201 p, 38 fig, 25 tab, 71 ref, 6 append.

Descriptors: *Irrigation efficiency, *Sprinkler irrigation, *Irrigation practices, *Irrigation water, Trickle irrigation.

The current state of the art regarding the spatial distributions of irrigation water applications under surface, sprinkler, and trickle irrigation systems has been assessed. The analyses found in the literature and several new uniformity concepts have been integrated into models which can be used in both field and research applications. These models simulate the spatial distributions of applied irrigation water under specified design and operating conditions. The performance of an irrigation system has been described by a series of 'quality' parameters relating to: (1) uniformity in an irrigated field; (2) adequacy of the irrigation system in meeting crop requirements; (3) volume of applied water wasted as deep percolation; and (4) in the case of surface irrigation, the water leaving the field as tailwater. Verification of the models developed during this project was made against most of the data identified in the literature as well as an intensive collection effort as part of this project. The results illustrate both the use of the analytical approach and the procedures for field data collection. (Skogerboe-Colorado State)
W79-02632

A PROGRAM TO PROMOTE IRRIGATION CONSERVATION IN IDAHO,
Idaho Dept. of Water Resources, Boise.
J. R. Hammond.
March 1978. 43 p, 6 fig.

Descriptors: *Irrigation efficiency, *Irrigation conservation, Irrigation incentives, *Idaho, Idaho Irrigation Conservation Program, Water delivery organizations, Water law, Costs, Benefits, *Water conservation.

Studies have shown that many irrigators in Idaho employ more water conserving systems and practices than others. Similar observations have been made among water delivery organizations. While physical considerations influence the extent that more efficient systems and practices are employed, they do not fully explain differences in irrigation efficiency. Economic, social, legal and institutional factors are examined to determine their effects on irrigation efficiency. The direct and indirect costs and benefits of improving irrigation efficiency are discussed. The benefits which some users may derive from the waste, seepage or return flow waters of others are also discussed. The right to conserve and use conserved water is examined. The trend toward the adoption of water conserving improvements in Idaho is discussed. The impacts of existing state and federal programs on irrigation conservation are examined. A goal for irrigation conservation is defined to include the positive and negative impacts of improving efficiency. Three levels of emphasis (low, moderate, aggressive) are compared for developing a state irrigation conservation program in light of the irrigation conservation goal. Based on the evaluation of the three programs it is recommended that a low emphasis program be adopted and that a more aggressive program not be implemented until the positive and negative impacts of improving irrigation efficiency can be more clearly established.
W79-02671

OPTIMIZING IRRIGATION SYSTEM DESIGN,
Idaho Dept. of Water Resources, Boise.
G. D. Galinato, J. R. Busch, and C. E. Brockway.
Completion Report, June 1977. 266 p, 20 ref, 5 append. Bur. Reclam. 14-06-100-9087.

Descriptors: *Irrigation systems, *Optimization, Planning, Rehabilitation, *Idaho, Cost analysis, *Irrigation efficiency, *Irrigation design.

A method of rapidly obtaining optimal irrigation system designs has been developed for use by planning personnel of the Bureau of Reclamation, Pacific Northwest Region. The method allows planners to obtain optimal system designs for various specified irrigation efficiencies and water costs and to rapidly evaluate the effects of changes in these parameters in conjunction with physical and socioeconomic constraints. Cost estimating routines are used to obtain annual costs associated with canal and pipeline sections, pumping units and on-farm application systems. The optimization procedure is a two-stage dynamic-linear programming approach. Dynamic programming is first used to eliminate undesirable conveyance system components, and linear programming is then used to obtain the optimal system design of all conveyance and application components. Component and water costs and various constraining conditions are easily changed in the linear-programming problem to allow planners to evaluate many aspects in multi-objective planning. The entire procedure has been used to develop alternative plans for a portion of a Bureau project. The results obtained are least cost systems that are compatible with Bureau planning guidelines. The procedure may be used for developing optimal system plans for rehabilitation projects as well as for new projects.

SOCIAL OVERHEAD CAPITAL COSTS OF IRRIGATION DEVELOPMENT IN WASHINGTON STATE,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
N. K. Whittlesey, K. C. Gibbs, and W. R. Butcher.
Water Resources Bulletin, Vol. 14, No. 3, p 663-678, June 1978. 2 fig, 4 tab, 7 ref.

Descriptors: *Irrigation development, *Energy, *Social overhead costs, Water resources, Capital costs, Columbia Basin(Washington), Projects, Taxes, Utility rates, Demand.

Increased irrigation as a means of achieving economic development can impose significant social costs on the state or region of growth. The growth in population induced by additional irrigation will require new roads, water and sewage facilities, schools, fire and police protection, and so forth. Also, the increased energy demands due to irrigation and growth in economic activity must be met. Capital investments required to service these needs of new development can become very large. This study attempts to measure such social overhead costs or irrigation development for some specific irrigation project areas of Eastern Washington. It is shown that investment costs in overhead items can reach $2,000 per acre irrigated or $70,000 per job created. Alternatively, the annual costs can equal $180 per acre or $6,700 per worker. These costs must be paid locally through increased taxes, utility rates, or costs for services. (Bell-Cornell)

THE ROLE OF AGRICULTURE. (COLORADO RIVER BASIN),
New Mexico State Univ., University Park.
G. W. Thomas.
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p 156-172. University of Arizona Press, Tucson. 1978. 1 tab, 1 fig, 23 ref.

Descriptors: *Colorado River Basin, *Land use, *Agriculture, *Multiple purpose, Foods, Land tenure, Variability, River basin development, Economic justification, Alternative planning, Planning, Future planning(Projected), Regional analysis, Economic impact, Cost-benefit analysis, Economic feasibility, Grazing.

The demand for land to develop energy, mineral, recreational, and environmental resources in the Colorado River Basin is expected to increase competition with agricultural and grazing enterprises. Conversely, need for food and fiber, as well as the U.S. reliance on agricultural exports for foreign exchange, are external forces being exerted upon the allocation of the region's lands. Here the context in which agricultural decisions, public and private, must be made, and the relation of these to the resource base of the region are reviewed. Uncultivated lands account for the largest acreage in the Basin, and are of use for timber production, livestock grazing, recreation, wildlife, wilderness, watersheds, and minerals. Land use and management decisions on these lands are complicated by three major factors: (1) land ownership patterns,

(2) extreme variability in climate, soils, vegetation, and topography, and (3) multiple-use possibillities. In termas of land area, the dominant agricultural use in the region is for grazing and timber. Prospects and problems involving the water and energy demands on these uncultivated lands of the Basin are reviewed. (See also W79-02732). (Tickes-Arizona).

SOIL AND WATER LOSS FROM CONSERVATION TILLAGE SYSTEMS,
Science and Education Administration, Ames, IA. North Central Region.
J. M. Laflen, J. L. Baker, R. O. Hartwig, W. F. Buchele, and H. P. Johnson.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 5, p 881-885, September-October 1978. 5 fig, 2 tab, 11 ref.

Descriptors: *Soil erosion, *Runoff, *Iowa, *Farm management, *Soil conservation, Sediments, Mulching, Corn, Simulated rainfall, Soils, Soil types, Rainfall, Crops, Agriculture, *Tillage practices, Residue cover.

A rainfall simulator was used to evaluate the effects of 6 different tillage practices on soil and water losses from continuous corn for 3 soils in Iowa. Soil loss decreased as tillage decreased. Percent of soil covered by corn residue explained between 78 and 89% of the variance in erosion among tillage systems. The effect of nonuniformly distributed corn residue on controlling erosion was greater than expected based on a published mulch factor. Runoff amounts decreased as residue cover increased for 2 of the 3 soils studied. No critical slope length limits were found for the tillage practices, soils, slopes, and slope lengths studied except for till-planting on the Ida soil. As sediment concentrations increased, mean sediment size increased for one soil, decreased for a second soil, and was unrelated to sediment concentration for the third soil. (Sims-ISWS)

YIELD AND QUALITY OF CORN AND GRAIN SORGHUM GRAIN AND RESIDUES AS INFLUENCED BY N FERTILIZATION,
Nebraska Univ., Lincoln. Dept. of Agronomy.
L. J. Perry, Jr., and R. A. Olson.
Agronomy Journal, Vol. 67, No. 6 p 816-818, November-December 1975. 3 tab, 12 ref.

Descriptors: *Grain sorghum, Corp response, *Corn(Field), *Nitrogen, *Fertilizers, *Fertilization, *Crop production, *Crop residues.

Crop residues of grain sorghum and corn have attracted attention as an alternate economical forage resource for livestock utilization. There are little data available on agronomic production factors affecting yield and quality of crop residues. The effect of rate and time of N fertilizaton on irrigated corn and grain sorghum grain and residue yields, grain N content, and forage quality of the residues was evaluated. It was concluded that N rate and time of application do affect yield and quality of row crop residues. (Skogerboe-Colo St)
W79-02987

RESPONSE CURVES OF VARIOUS TURFGRASSES TO APPLICATION OF SEVERAL CONTROLLED-RELEASE NITROGEN SOURCES,
Florida Univ., Gainesville. Dept. of Soil Science.
G. M. Volk, and G. C. Horn.
Agronomy Journal, Vol. 67, No. 2, p 201-204, March-April 1975. 6 fig, 9 ref.

Descriptors: Turf, *Turf grasses, *Nitrogen, *Fertilizers, Fertilization, Ureas, *Crop response, Crop production.

Responses of turfgrasses to controlled-release N sources, especially the newer materials have not been adequately evaluated under field conditions. This study obtained N time-release curves as measured by clippings taken periodically after the initial response to readily available N such products contain had subsided. Materials were surface-applied once, or at widely spaced intervals, to six different turfgrasses. Three to 4-day growth clippings were taken periodically to assess current N uptake rate against that from a standard treatment consisting of a continuous, uniform, weekly application of NH4NO3. Sulfur-coated urea gave the most desirable response for summer fertilization, followed by isobuthlidene diurea (IBOU), activited sewage sludge and urea form. IBOU was superior to the other materials for winter usage. (Skogerboe-Colo St)

SOYBEAN YIELDS AND LANCE NEMATODE POPULATIONS AS AFFECTED BY SUBSOILING, FERTILITY, AND NEMATICIDE TREATMENTS,
Agricultural Research Service, Tifton, GA. Coastal Plain Station.
M. B. Parker, N. A. Minton, O. L. Brooks, and C. E. Perry.
Argonomy Journal, Vol. 67, No. 5, p 663-666, September-October 1975. 1 fig, 5 tab, 13 ref.

Descriptors: *Soybeans, Crop response, *Nematodes, Fertilization, Nematicides, Soil compaction, *Crop production.

Soil compaction, Nematode damage, and fertility problems occurring singly and in combination appear to be responsible for low yields of soybeans in some Coastal Plain soils. This study was designed to determine if these conditions could be corrected with certain fertility treatments, subsoiling, and a nematicide. Results indicate the importance of the nematicide, 1,2-dibromo-3-chloropropane, and subsoiling for soybean production on compacted soils infested with lance nematodes. (Skogerboe-Colo St)

EFFECT OF IRRIGATION, LIME, AND FERTILITY TREATMENTS ON THE YIELD AND CHEMICAL COMPOSITION OF SOYBEANS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
J. A. Lutz, Jr., and G. D. Jones.
Agronomy Journal, Vol. 67, No. 4, p 523-526, July-August 1975. 6 tab, 5 ref.

Descriptors: *Soybeans, *Crop response, *Nutrients, *Fertilization, Potassium, Phosphorus, Irrigation, Irrigation effects, *Lime, *Micronutrients.

Data are available on the effects of surface applied plant nutrients on the yield, quality, oil, and protein contents of soybean seed and on the chemical composition of the soybean leaves. Very little information is available, however, on the effects of irrigation and plow sole (30.5 cm) placement of plant nutrients on these same plant characteristics. In order to determine the effects of irrigation and plow sole placement of P, K, lime, and micronutrients on the quality, yield, oil, and protein contents of soybean seeds and on the chemical composition of the leaves, a field experiment was conducted for 3 consecutive years. Soybean seed yields were increased each year with irrigation. Yields were unaffected by P and K treatments during the first 2 years, but in the thirty year, yields were lower where P and K had not been applied on the plow sole. Lime and micronutrients did not significantly affect yield. Irrigation increased the oil content but did not effect the protein content. Leaf P and K concentration were unaffected by irrigation but were affected by P and K applications. (Skogeboe-Colo St)

EFFECT OF IRRIGATION AND NITROGEN ON THE DRY MATTER AND CRUDE PROTEIN YIELDS OF 'PANGOLA' DIGITGRASS,
University of the West Indies, St. Augustine (Trinidad). Dept. of Soil Science.
L. Byam, and F. A. Gumbs.
Agronomy Journal, Vol. 67, No. 3, p 365-369, May-June 1975. 6 tab, 14 ref.

Descriptors: *Grasses, *Forage grasses, Irrigation effects, Irrigation, Crop response, Crop production, *Dry farming, Dry seasons, Fertilizers, *Fertilization, *Nitrogen, Loam, Sands, *Pangola digitgrass.

In Trinidad, West Indies, a dairy industry is being developed on Piarco fine sand/fine sandy loam soil. The soil is physically and chemically poor. The cattle obtain most of their food supply by grazing 'Pangola' digitgrass. There is an urgent need to increase grass production on this soil type. Inadequate water supply in the dry season limits grass production. Previous fertilizer trials with Pangola digitgrass on this soil type have indicated that N fertilizer is likely to give better yield response than P, K, or Ca. This trial was therefore conducted to determine the irrigation-N management for wet and dry season production of Pangola digitgrass on this soil at adequate levels of P and K. (Skogerboe-Colo St)

Institute for Research on Land and Water Resources Research, Penn State Univ., Project Technical Completion Report, Dec 1978. 98 p, 19 fig, 11 tab, 23 ref, 3 append. OWRT A-049-PA(1), 14-34-0001-8040.

Descriptors: *Flood peak, *Flooding, *Pennsylvania, Urbanization, *Maps, *Population density, *Streamflow regulation, *Flood indices, *Flood potential, Index maps, Gaged watersheds, Ungaged watersheds, Return period.

Flood-potential index maps were developed for Pennsylvania. Flood indices were computed for gaged watersheds by dividing the 100-year and the 2.33-year flood peaks by the watershed area contributing to flooding. It was found that Q2.33 is proportional to A0.8 and Q100 is proportional to A0.7. Flood indices were plotted on maps broken down into three area ranges and two return periods. A procedure was developed using the flood-potential index maps to estimate peak floods for ungaged watersheds. The square of the inverse distance to nearby flood index location is used as a weighting factor. The flood index is estimated for the 100-year and the 2.33-year return period and the corresponding flood peaks are computed. A nomograph is provided to obtain flood peaks for return periods between 2.33- and the 100-year periods. The effect of streamflow regulation on flood peaks was studied. Various approaches to correct flood indices for streamflow regulation were tried. A preliminary study of the effect of urbanization on flood peaks was also made. Population density was used as a parameter in the correction of flood indices. (Sink-Penn State)

TRANSIT LOSSES AND TRAVELTIMES OF RESERVOIR RELEASES ALONG THE ARKANSAS RIVER FROM PUEBLO RESERVOIR TO JOHN MARTIN RESERVOIR, SOUTHEASTERN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
R. K. Livingston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 129, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 78-75, September 1978. 30 p, 8 fig, 8 tab, 14 ref.

Descriptors: *Water management(Applied), *Reservoir operation, *Reservoir releases, *Streamflow, *Flow control, Computer models, Streamflow forecasting, Diversion, Water loss, Surface-groundwater relationships, Aquifer characteristics, Channel morphology, Hydrologic data, Time of travel, *Colorado, *Arkansas River reservoirs(Colo).

The volumes of reservoir releases are decreased or delayed during transit by bank storage, channel storage, and evaporation. Results from a computer model, calibrated by a controlled test release from Pueblo Reservoir, Colo., indicate that transit losses are greatest for small releases of a short duration when made during periods of low Antecedent streamflow. For equivalent releases, transit losses during the winter are about 7 percent less than losses during the summer. Based on available streamflow records, the velocity of reservoir releases ranges from about 0.6 miles per hour at the downstream end of the study reach, when antecedent streamflow is 10 cubic feet per second, to about 6.8 miles per hour at the upstream end of the study reach, when antecedent streamflow is 3,000 cubic feet per second. Consequently, the traveltime of a release increases as antecedent streamflow diminishes. Management practices that may be used to benefit water users in the study area include selection of the optimum time, rate, and duration of a reservoir release to minimize the transit losses, determination of an accurate traveltime, and diversion at several incremental rates. Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 272, Price codes: A08 in paper copy, A01 in microfiche. Second Annual Report, Prepared for Environmental Protection Agency, 1974. 35 fig, 42 tab, 53 ref, 3 append, 1 plate. EPA-68-01-2653.

Descriptors: *Montana, *Stream flow, *Sediment transport, *Fish types, *Aquatic environment, *Bathymetry, *Ice cover, Low flow, Velocity, Aquatic insects, Aquatic life, Mapping, Montana, *Tongue River(Mont).

The objective of this study included the implementation of a methodology for the recommendation of minimum streamflow on a medium sized river containing a warm water fish community; an evaluation of the suitability of the methodology; and an evaluation of flow criteria, including nonbiotic factors, used in making the flow recommendation. Flow criteria for the recommendation of minimum streamflows were established using the stonecat as an indicator species. Fish distribution as related to major habitat areas, instream flow needs, and proposed coal development were examined as were the in-stream requirements of the benthic macroinvertebrates. The Tongue River in Montana was used for the study. (Lardner-ISWS)

CONTROL OF 1973 MISSISSIPPI RIVER FLOOD,
Army Engineer District, Vicksburg, MS.
R. I. Kaufman.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 104, No. WR1, p 105-121, November 1978. 4 fig, 1 tab, 4 ref.

Descriptors: *Flood control, *Levees, *Mississippi River, Seepage, Waves(Water), Drainage, Basins, Planning, Projects, Hydrologic data, Floods, Design, Government agencies.

In 1973, a major flood occurred on the Mississippi River. Much of the alluvial valley of the river between Alton, Ill. and the Gulf of Mexico is protected against floods by Federally constructed flood control works. As some of these systems were not complete at the onset of the flood, a major flood fight was required to safeguard the valley. Many miles of levee had to be raised to provide proper protection. Other problems requiring flood-fight efforts were seepage under levees, scour at levees and structures, and riverbank failures. Even though major emergency efforts were required, the Federal flood control systems were effective and of great value in controlling the flood. The projects prevented the inundation of 26,000 sq miles (67,500 km2) of land and reduced flood damages by over $14,000,000,000. However, the losses sustained indicate the need to complete authorized works and possibly expand existing projects or initiate new projects in some areas, or both. (Bell-Cornell)

W. D. Maughan.
In: Values and Choices in the Development of the Colorado River Basin, ed by D F Peterson and A. B. Crawford, p 9-17, 1978. University of Arizona Press, Tucson. 1 fig, 9 ref

Descriptors: *River basin development, *Colorado River basin, *Saline water, *Water quality, Water utilization, Comprehensive planning, Regional development, Water management(Applied).

The climate of this great river basin, draining nearly a quarter of a million square miles, from Wyoming to Mexico, is arid to semiarid, with precipitation ranging from more than 50 inches in the higher northern mountains drown to less than 4 inches in the southern desert. The geology of the basin accounts for its tremendous salt deposits, many of which are exposed to erosion or to contact with percolating waters, thus contributing to the salt load of the river itself. It is now generally acknowledge that for all practical purposes the water supply of the river is completely depleted, since only minor quantities of essentially unusable water reach the Guld of California. While the basin has been effectively converted into an immense continental resource for man's use, increasing attention to the consequences of this use is now being paid. Unless great care is taken, the salinity problem will be amplified by actions associated with untapping the great energy resources of the upper basin, especially if mass development of oil shale and coal reserves occurs. Any long range solution to the problems of the Colorado River Basin lies outside the control of any one of the several states through which it flows, and basin-wide planning must be initiated by one means or another. Descriptors: Soils, Seepage, Reservoirs, *Seepage control, *Soil water movement, *Forecasting, *Arizona, *Hydraulic conductivity, Alkaline soils, Soil texture, Sodium adsorption ratios, Sealing(Ponds).

Permeameter experiments were performed on six Arizona soils using a solution of 12.5 meq/l and varied sodium concentrations. Hydraulic conductivities for five soils were reduced 60 to 95 percent for input solutions having maximum sodium adsorption ratios (SAR) to 25. Effective soil sealing occurred even though the soils were alkaline. Sealing with sodium appears nearly irreversible at low solution concentrations and saturated conditions. The soil having the highest initial hydraulic conductivity recovered less than 20 percent of the original conductivity upon reapplication of a calcium solution. These results are useful when considering sealing small ponds by sodium application. Hydraulic conductivity changes from increases in solution SAR were described mathematically using two empirically determined parameters that appear unique for each soil at a constant concentration. The parameters found for this study, plus those found from data of previous studies, were compared using multiple regression analysis to determine the most significant soil properties in predicting conductivity changes. Soil texture has the greatest influence on the parameters. An equation derived by combining data from eleven alkaline soils was selected as best for predicting hydraulic conductivities resulting from SAR changes. Predictions should be improved if additional soil data were available for analysis.

EFFECTS OF WATER DRAWDOWN ON THE FAUNA IN SMALL COLD-WATER RESERVOIRS,
Colorado Univ., Ft. Collins.
M. E. McAfee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 391, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, Fall 1976. 70 p, 13 fig, 8 tab, 71 ref, append. OWRT B-132-COLO(1), 14-34-0001-6062.

Descriptors: Recreation, High country reservoir, Water management(Applied), Fishery quality, *Reservoir drawdown, *Reservoir operation, *Reservoir releases, Drawdown, Flow control, Reservoir management, Primary productivity, *Fisheries management, Invertebrates, *Colorado.

Four small, cold-water reservoirs were studied to determine the effect of drawdown on their fauna. Two of the reservoirs, Idaho Springs and Urad, had stable (non-fluctuating) water levels and two, Comanche and Eaton, were completely drawn down. Observations of reservoir and drainage basin characteristics and drawdown patterns were made, and primary productivity, invertebrate abundance, and abundance and condition of fish in the reservoir were measured. No conclusive evidence of drawdown was found. The primary productivity values were very low and varied only slightly between the reservoirs. Invertebrate densities were relatively high in Idaho Springs, a stable reservoir, and in Comanche, a drawdown reservoir. Invertebrate densities were somewhat lower in Urad and Eaton. Fish densities were also higher in Idaho Springs and Comanche than in the other two reservoirs. Coefficients of condition for game fish were somewhat higher in Urad, a stable reservoir, and Eaton, a drawdown reservoir. A possible reason for these results and their implications for management are discussed.

HOST SPECIFICITY OF CERCOSPORA RODMANII, A POTENTIAL BIOLOGICAL CONTROL OF WATERHYACINTH,
Florida Univ., Gainesville. Dept. of Plant Pathology.
K. E. Conway, and T. E. Freeman.
Plant Disease Reporter, Vol. 61, No. 4, p 262-266, April, 1977. 1 tab, 14 ref. OWRT A-033-FLA(2), 14-34-0001-7020.

Descriptors: *Biocontrol, *Plant pathogens, *Water hyacinth, Aquatic weeds, *Aquatic fungi, *Cercospora rodmanii.

The host specificity of the fungus Cercospora rodmanii, a pathogen of water-hyacinth (Eichhornia crassipes), was determined. The susceptibility of 85 selected plants (58 species, some with several cultivars tested) of economic and ecological importance, representing 22 families, were evaluated by both greenhouses and field test. A modified centrifugal (related plants) and varietal (economic plants) strategy was utilized in the selection of the plants to be tested. The results showed that C. rodmanii is a pathogen of waterhyacinth with a limited host range. Therefore its usage as a biological control for waterhyacinth would not be expected to create problems either for plants grown commercially or for plants considered of ecological importance in Florida. INVESTIGATION OF NATURAL SEALING PROCESSES IN IRRIGATION CANALS AND RESERVOIRS,
Idaho Univ., Moscow.
E. Brockway.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 491, Price codes: A07 in paper copy, A01 in microfiche. PhD Dissertation March 1977. 126 p, 33 fig, 17 tab, 61 ref, 2 append. OWRT A-023-IDA(2).

Descriptors: *Seepage water, *Canals, Hydraulics, *Reservoirs, *Surface sealing, Water loss, *Sealing, Sediment transport, *Hydraulic conductivity, *Seepage control.

Laboratory and field studies of physical, organic, and chemical factors affecting the variations in seepage rates due to natural processes in canals and reservoirs under prolonged submergence were performed. Effective reduction of hydraulic conductivity due to sediment migration in three sand sizes with three sediment sizes was examined in laboratory columns. Sediment migration measured nondestructively by gamma ray scanning was compared with corresponding changes in hydraulic conductivity. A simplified equation relating the deposit ratio, or volume of sediment retained at any point in the column to the hydraulic conductivity was developed. Procedures for estimating changes in hydraulic conductivity of Portneuf silt-loam soils of southern Idaho due to soil-water-chemical effects were developed.

MULTIOBJECTIVE TRADE-OFF RISKS IN RESERVOIR OPERATION,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
T. E. Croley, II, and K. N. Raja Rao.
Preprint 2863. Paper presented at the American Society of Civil Engineers Spring Convention and Exhibit. Dallas, Texas, April 25-29, 1977. 26p, 4 fig, 5 tab, 14 ref. OWRT A-054-IA(3), 14-34-0001-6016.

Descriptors: *Management, *Multiple objective, Trade-offs, *Planning, *Reservoir operation, *Optimization, Flood control, Recreational facilities, Sedimentation, Systems engineering, Water resources.

Noncommensurate, human factor multiobjectives that are subjectively discerned and evaluated now may be included in reservoir operation determinations through trade-off techniques. Objectives are related in terms of real trade-offs with constrained optimizations and a priori estimates of objective worth are eliminated. By repeating the constrained optimizations for many synthetic realizations of inputs, it is possible to evaluate the risk or confidence associated with each trade-off level (and associated operation policy). Bases on the subjective trade-off choices and associated reliabilities, trade-off levels for reservoir operation may be selected. The optimum operation rule is then derived (for those trade-off levels) using implicit stochastic optimization techniques already available and may be tested and modified in comprehensive reservoir models. The techniques are applied to the practical problem of the Coralville reservoir, near Iowa City, Iowa for flood control and recreation objectives in a sedimenting reservoir.

GRAVITY-FLOW IRRIGATION AND THE SPREAD OF AQUATIC WEEDS IN SUDAN,
Gezira Univ., Wad Medani (Sudan). Dept. of Biological Sciences.
M. E. Beshir.
Environmental Conservation, Vol. 5, No. 2, p. 143-146, Summer, 1978. 2 tab, 5 ref.

Descriptors: *Irrigation systems, *Aquatic plants, *Canals, *Artificial lakes, Agriculture, Irrigation, Wetlands, Ponds, Sudan, Ponding, Rainfall, River systems.

The distribution of rainfall in Sudan is highly seasonal in character. The country is dependent upon its river system for perennial irrigation for reliable agricultural production. At present about 4.6 million acres (1.9 million ha) are under irrigated agriculture. In these areas, irrigation is achieved by a gravity-flow method based on hydraulic principles which take maximum advantage of land contours. It consists of hierarchies of supply and distributive canals. The lower stages of these hierarchies, called Minor-canals, produce ponding conditions and are very favorable for extensive growth of aquatic macrophytes. Mechanical methods using rakes and chains operated by hand have been used to combat weed infestations. These methods will become unfeasible and ineffective as the present plan of irrigated agricultural development in Sudan will mean a corresponding increase in Minor-canals and extended man-made aquatic habitats. Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 074, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 78-74, June 1978. 40 p, 13 fig, 4 tab, 24 ref.

Descriptors: *Potential water supply, *Springs, *Streams, *Surface-groundwater relationships, *Saline water intrusion, Hydrogeology, Water supply, Aquifers, Potentiometric level, Flow nets, Diversion, Saline water-freshwater interface, Evaluation, Projections, *Florida, *Gulf coast, Citrus County(Fla), Hernando County(Fla).

Coastal springs and seeps, including Rainbow Springs, a tributary of Withlacoochee River, discharge as much as a billion gallons of water per day to low-lying coastal swamps and estuarine marshes along the Guld Coast of Citrus and Hernando Counties, Florida. Although Weeki Wachee Spring has long been regarded as an obvious source of freshwater supply, long-term diversion of large volumes of water from Weeki Wachee River will cause encroachment of brackish water throughout the residential canals in the lower reach of the river to about 4.4 miles below Weeki Wachee Spring. Weeki Wachee Spring is analogous to a flowering well tapping an artesian aquifer. Flow characteristics of Withlacoochee River and Rainbow Springs indicate that about 600 cubic feet per second is available on a perennial basis, disregarding the downstream requirements for control of saltwater encroachment. PRELIMINARY APPRAISAL OF THE GEOHYDROLOGIC ASPECTS OF DRAINAGE WELLS, ORLANDO AREA, CENTRAL FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. O. Kimrey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 136, Price codes: A02 in paper copy, A01 in microfiche. Water-Resources Investigations 78-37, May 1978. 24 p, 8 fig, 1 tab, 8 ref.

Descriptors: *Groundwater recharge, *Hydrogeology, *Drainage wells, *Aquifer characteristics, *Water quality, Aquifer management, *Florida, *Orlando area(Fla), *Floridan aquifer.

The Floridan aquifer contains two highly transmissive cavernous zones in the Orlando area: an upper producing zone about 150-600 feet below land surface and a lower producing zone about 1,100-1,500 feet below land surface. Natural head differences are downward and there is hydraulic connection between the two producing zones. Drainage wells are finished open-end into the upper producing zone and emplace surface waters directly into that zone by gravity. Quantitatively, their use constitutes an effective method of artificial recharge. Their negative aspects relate to the probably poor, but unknown, quality of the recharge water. Caution is suggested in drawing definite and final conclusions on the overall geohydrologic and environmental effects of drainage wells prior to the collection and interpretation of a considerable quantity of new data. Though few ground-water pollution problems have been documented, the potential for pollution should be seriously considered in light of the probable continuing need to use drainage wells; the probable volumes and quality of water involved; and the hydraulic relations between the two producing zones. Available from OFSS, Box 25425, Denver, CO 80225; microfiche, $3.50; paper copy, $25. Open-file report 78-826, September 1978. 3 p, 1 fig, 1 tab.

Descriptors: *Groundwater, *Pumping, *Water utilization, *Irrigation, Withdrawal, Estimating, Electricity, Electric motors, *California, *San Joaquin Valley(Calif), Groundwater pumpage.

Agricultural ground-water pumpage data are presented for 1974-77 for the area on the west side of the San Joaquin Valley in parts of Fresno, Kings, and Madera Counties, Calif., which has approximately the boundaries of the Westlands Water District. The method of estimating pumpage was based on electric-power consumption at the agricultual wells. (Woodard-USGS)

FEASIBILITY OF WATER-SUPPLY DEVELOPMENT FROM THE UNCONFINED AQUIFER IN CHARLOTTE COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. M. Wolansky.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 220, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 78-26, April 1978. 34 p, 13 fig, 3 tab.

Descriptors: *Groundwater resources, *Water resources development, *Water supply, *Hydrogeology, *Water quality, Evaluation, Aquifer characteristics, Groundwater movement, Transmissivity, Groundwater recharge, Shallow wells, Water yield, Water table, *Florida, Charlotte County(Fla).

The unconfined aquifer in Charlotte County contains some potable water over most of the county, and represents a potential source of water supply to help satisfy the increasing demands of development. An estimated 150 billion cubic feet of relatively good quality water is stored in the unconfined aquifer. Transmissivity of this aquifer averages about 500 square feet per day, ranging from 100 to 7000 feet per day. Although recharge is primarily from rainfall, a significant amount occurs by upward movement of water from underlying confined aquifers through abandoned and flowing irrigation wells. Average annual recharge is estimated at 12 inches per year, and ranges from less than one inch to 16 inches per year. Chemical quality of the water is variable. However, chloride concentrations of water from the unconfined aquifer generally are less than 50 milligrams per liter. The area of greatest potential yield is located east of Telegraph Swamp in eastern Charlotte County. (Woodard-USGS)

NICOMEKL-SERPENTINE BASIN STUDY, BRITISH COLUMBIA,
Department of Fisheries and Environment, Vancouver (British Columbia). Water Resources Branch.
E. C. Halstead.
Scientific Series No. 94, 1978, 36 p, 24 fig, 3 maps, 9 ref, 4 tab.

Descriptors: *Artesian wells, *Watersheds(Basins), *Groundwater, *Irrigation, *Movement, Methodology, Investigations, Climatology, Hydrology, Geology, Chlorides, Chemical analysis, Stratigraphy, Bedrock, Glaciology, *Canada, *Nicomekl-Serpentine drainage basin(B C), *British Columbia.

The Nicomekl-Serpentine drainage basin covers an area of 322 sq. km. (124 sq mi) of which 57 sq km (22 sq mi) are lowlands below elevations of 1 m (3 ft). The lowlands occupy a former embayment of the sea that is filled with more than 300 m (1000 ft) of unconsolidated Quaternary deposits. All of the wells drilled within the lowlands are flowing artesian, but the geology does not indicate a classical artesian basin. The groundwater movement within the drainage basin has been defined using geochemistry. Local flow systems that occur in the upland areas become integrated into major flow systems, the discharge end of which occupies the lowlands. The high total dissolved solids and hydrochemistry of the groundwater within the lowlands suggest that groundwater movement is controlled in part by (1) flow reversals caused by semidiurnal tidal fluctuations; (2) decreased permeabilities owing to facies changes inherent in the sediments that were deposited in a fluvial, glaciofluvial and glaciomarine environment; and (3) flow restrictions caused by the confluence of regional flow systems. Since a relatively high NaCl concentration is characteristic of the quality of much of the groundwater, a map showing isochlors, or lines of equal chloride concentrations, is included in this report as well as a classification using sodium criteria as a guide to illustrate the suitability of the groundwater for irrigation. Descriptors: *Groundwater, Hydraulics, *Wyoming, Groundwater movement, Geohydrology, Potable water, Dissolved solids, Calcium, Magnesium, Bicarbonates, *Sites(Water wells), *Casper aquifer(Wyo), Laramie(Wyo).

The Casper aquifer is defined as the saturated part of the Casper and Fountain formations in the vicinity of Laramie, Wyoming. Faults provide lateral and vertical zones of large transmissivity, and are hydraulic drains that collect westward-flowing ground water and shunt it to springs near the Casper-Satanka contact. Recharge to the aquifer over a 79 sq. mi. intake area is estimated to be 1.4 inches/year. The Casper aquifer contains potable water that has a total dissolved solids range of 139 to 285 milligrams/liter. The chemical character of Casper water is calcium-bicarbonate in elevated parts of the recharge area but becomes a calcium-magnesium-bicarbonate water down-grandient.

DUG-WELLS, DUG-CUM-BORE WELLS, AND TUBEWELLS,

Central Groundwater Board, Nagpur (India).
P. G. Adyalkar.
Indian Farming, p 13-16, March, 1975.

Descriptors: *Dug wells, *Water wells, *Water supply, *Shallow wells, *Water yield, Water sources, Groundwater, Groundwater mining, Water table, Well data, Permeability, Wells, Hydrogeology, Boreholes, Soil texture, Recharge, Soil types, Aquifers, Surveys, Water resources, Dug-cum-bore wells, *Tubewells, *India.

For optimum potential, dug wells should have a large diameter, adequate water column, high permeability and low hydraulic gradient. In non-arid regions their depth is limited to 60 m, and in Maharashtra and Madhya Pradesh in India, the dug-wells are generally limited to 20 m. A water column of about 5 m in the lean part of the year should be adequate. There is good reason to put a bore in an existing well (dug-cum-bore wells) when: (1) the formation tapped in the open well is fine-grained or poor in productivity, and there is a good chance of encountering a coarse-grained or productive formation below a depth of 15 m; (2) the formation tapped in the open well is limited in depth but underlain by an effective confining bed followed in depth by a good confined aquifer; or (3) the potential productive water table zone is tapped fully in the existing due well by improvement in respect to increased depth, diameter and water column. A tubewell taps a potential confined aquifer below a confining layer and therefore effectiveness of the tubewell will depend upon the effectiveness of the confining bed. (Robinett-Arizona)

4C. Effects On Water Of Man's Non-Water Activities

EFFECT OF TILLAGE SYSTEMS ON RUNOFF LOSSES OF NUTRIENTS, A RAINFALL SIMULATION STUDY,
Iowa Natural Resources Council, Des Moines.
S. G. Barisas, J. L. Baker, H. P. Johnson, and J. M. Laflen.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 5, p 893-897, September-October 1978. 6 fig, 1 tab, 23 ref.

Descriptors: *Soil erosion, *Runoff, *Nutrients, *Farm management, Soil conservation, Crops, Corn, Mulching, Rainfall, Simulated rainfall, Soils, Soil types, Sediments, Phosphorus, Nitrogen, Nitrates, Ammonia, Phosphates, Water pollution, Agriculture, *Tillage practices, Residue cover.

The objective of this study was to evaluate the effects of different tillage practices on the loss of N and P in runoff and sediment from experimental plots using simulated rainfall. Twelve plots on each of 3 different Iowa soils were planted to corn, and 6 tillage practices were used. Simulated rainfall was applied to the plots, and surface runoff samples were collected. The water fraction of the runoff was analyzed for NO3-N, NH4-N, and PO4-P; the sediment was analyzed for total nitrogen and available phosphorus. At all sites, the available P content of the eroded soil increased with residue cover; however, decreased soil loss with increased residue cover offset the higher available P content of the eroded soil. Loss of total N with sediment was inversely related to the percentage of soil covered with residue. Losses of NO3-N, NH4-N, and PO4-P with water were small as compared with N and P losses with sediment. Soluble nutrient concentrations were positively correlated with the amounts of soil surface covered with residue. Conservation tillage practices are ineffective in reducing the loss of water soluble nutrients; however, they did reduce total nutrient loss by controlling erosion. (Sims-ISWS)

HISTORICAL LAND USE CHANGES AND IMPACTS IN LAKE CHAMPLAIN WETLANDS (1941/42, 1962, 1974),
New England River Basins Commission, Burlington VT. Lake Champlain Basin Study.
E. Barber, D. J. Bogucki, G. K. Gruendling, and M. Madden.
June, 1977. 80 p, 3 tab, 5 ref, 2 append.

Descriptors: *Wetlands, *Land use, *History, *Lake Champlain, Marshes, Lakes, Land development, Marsh management, Agriculture.

Historical trends in land use change and impacts were analyzed from the early 1940's through 1974 for land both in and adjacent to 12 selected or priority Lake Champlain areas. This has changed little except for a slight tendency towards abandonment of cultivated areas since 1939-42. Only a few places have been developed residentially or industrially to any extent, and these are all located in close proximity to urban areas. Wetlands with gentle slopes from the terrestrial to the wetland environment (primarily deltaic and bayhead) are apparently much more subject to man-related pressures. In addition, these wetlands are more prone to be state conservation agencies' sites of habitat modification for waterfowl management and recreational complexes. (Steiner-Mass)

Descriptors: *Cycling nutrients, *Water budget silviculture, *Productivity, Coniferous forest, Deciduous forest, *Southern Appalachian Mountains region, *North Carolina.

A research program at the Coweeta Hydrologic Laboratory, North Carolina, is investigating effects of perturbation or manipulations on nutrient cycling and productivity of forested watersheds. The experimental approach is to explain whole ecosystem behavior, as revealed by watershed nutrient and water budgets, by reference to internal ecosystem processes. Research is designed to examine the emergence of higher level ecosystem properties from lower level component processes. This report describes the general scope of the research at process levels and relates dynamics of internal processes to ecosystem level response. The research is organized around a general theory of ecosystem relative stability, based on the complementary aspects of resistance to disturbance and resilience following disturbance. The research is a cooperative effort between the U. S. Forest Service and the University of Georgia. (Forest Service)

In: Watershed Research in Eastern North America: A workshop to compare results, February 28-March 3, 1977, Edgewater, Maryland, Chesapeake Bay Center for Environmental Studies, Smithsonian Institute, Tidemark Printing, Inc., Edgewater, Vol. I, p. 767-789. 1977 5 fig, 2 tab, 19 ref.

Descriptors: *Nitrogen cycle, *Productivity silviculture, Forest practices, Coniferous trees, Deciduous trees, Southeastern ecosystems.

Research at the Coweeta Hydrologic Laboratory is examining effects of management practices on elemental cycles in forested watersheds. Forest harvesting methods may alter both quality of streamwater draining forested lands (the off-site response) and sustainable productivity of forest being managed (the on-site response). Results from Coweeta suggest that long-term changes in water-quality are not likely to result from current management practices, but effects on sustainable yield are unknown. Simulation models of nitrogen cycling were used to assess potential effects of several management alternatives on sustainable productivity and elemental cycling. Responses of nitrogen dynamics in oak-hickory and loblolly pine forest to simulated merchantable-stem and complte-tree harvests with several rotation lengths were examined. Results suggest that some management practices may lead to long-term alterations of nitrogen cycling and productivity, and that conclusions from such simulation studies will depend on how elemental cycling models are conceptualized. Discussions emphasize the importance of evaluating land-management alternatives in the context of current knowledge of forest elemental cycling processes. (Forest Service)

NUTRIENT BUDGETS FOR UNDISTURBED AND MANIPULATED HARDWOOD FOREST ECOSYSTEMS IN THE MOUNTAINS OF NORTH CAROLINA,
Southeastern Forest Experiment Station, Franklin, NC. Coweeta Hydrologic Lab.
W. T. Swank, and J. E. Douglass.
In: Watershed Research in Eastern North America: A workshop to compare results, Feb 28-Mar 3, 1977, Edgewater, Maryland, Chesapeake Bay Center for Environmental Studies, Smithsonian Institute, Tidemark Printing, Inc., Edgewater, Vol. I, p 343-363. 1977 2 fig, 7 tab, 16 ref.

Descriptors: *Forestry practices, *Water quality, Chemical properties, *Cycling nutrients, Silviculture, Coniferous forest, Deciduous forest, *Southern Appalachian Mountains, *North Carolina.

Stream chemistry was monitored for 8 mature hardwood ecosystems and 16 forested systems that were altered by cutting, species conversions, and changes in land use. Net budgets (input minus output) of NO3-N, NH4-N, PO4-P, Cl-, K+, Na+, Ca++, Mg++, SO4=, and SiO2 were estimated for 15 ecosystems based on dissolved ion concentrations and the quantity of precipitation and streamflow. None of the manipulations produced long-term nutrient discharges that would adversely affect water quality for municipal or fishery use. Of the nutrients studied, NO3-N provided the most sensitive index of ecosystem disturbance. When the forests were cut and in various stages of revegetation, elevated NO3-N discharge was observed at least 13 years after cutting, but appeared to return to baseline levels 20 years after treatment. No changes in the discharge of NH4-N and PO4-P were observed for any of the watersheds; all ecosystems showed very large accumulations of SO4=. A grass-to-forest succession watershed that had been fertilized, limed, and herbicided showed large nutrient losses. Conversion of deciduous forests to eastern white pine reduced the loss of most nutrients, and net budgets of young coppice forests indicated nutrient cycles that wer as closed or tight as mature hardwood forests. Results demonstrate the importance of both hydrologic and biologic processes in evaluating ecosystem response. (Forest Service)

A MULTIOBJECTIVE APPROACH TO MANAGING A SOUTHERN ARIZONA WATERSHED,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
A. Goicoechea, L. Duckstein, and M. Fogel.
In: Hydrology and Water Resources in Arizona and the Southwest. Proceedings of the 1976 Meetings of American Water Resources Assn. and Arizona Academy of Sciences, Tucson, Arizona, April 29-May 1 1976, p 233-242 (1976). OWRT B-043-ARIZ(10), 14-31-0001-5056.

Descriptors: Decision making, Natural resources, *Arizona, *Watershed management, *San Pedro River watershed(Ariz), Mathematical programming, *Multiobjective management.

The case study of an Upper San Pedro River watershed is developed to show how a multiple objective approach to decision-making may be used in watershed management. The effects of various land treatments and management practices on water runoff, sediment, recreation, wildlife levels, and commercial potential of a study area are investigated while observing constraints on available land and capital. The example involves the optimization of five objective functions subject to eighteen constraints. In an iterative manner, the decision-maker proceeds from one noninferior solution to another, comparing sets of land management activities for reaching specified goals, and evaluating trade-offs between individual objective functions. This technique, which involves the formulation of a surrogate objective function and the use of the cutting plane method to solve the general nonlinear problem, hopefully provides a compromise between oversimplified and computationally intractable approaches to multiobjective watershed management.

5. WATER QUALITY MANAGEMENT AND PROTECTION

MICROBIAL DEGRADATION OF PESTICIDES,
Cornell Univ. Agricultural Experiment Station, Ithaca, NY. Dept. of Agronomy.
M. Alexander.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-047 675, Price codes: A08 in paper copy, A01 in microfiche. Office of Naval Research, Department of the Navy, Contract Numbers N00014-76-C-0019, N00014-67-A-0077-0027, 159 p, 1977. 29 fig, 38 tab, 142 ref.

Descriptors: *DDT, *Microbial degradation, *Bacteria, *Fungi, *Metabolism, Biodegradation, *Pesticide residues, *Chlorinated hydrocarbon pesticides, *Pesticides, Chemical reactions, Pesticide kinetics, DDD, DDE, Organophosphorus pesticides, Chemical analysis, Enzymes, Organic compounds, Aquatic algae.

Microbial degradation of various organochlorine, organophosphorus and carbamate pesticides by aquatic and soil microorganisms was studied. Bacteria, fungi, and an alga (Cylindrospermum sp.) metabolized DDT to water-soluble products. 1,1-dichloro-2,2-bis(P-chlorophenyl)ethane, 1,1-dichloro-2,2-bis(P-chlorophenyl)ethylene, DDD, DDE, DDM, DBH, DBP and PCPA were detected. The degradation of DDT metabolites yielded: DDM, DBH and DBP from DDA; DBH and DBP from DDM; and DBH from DBP. DDT and its breakdown products had no significant effect on respiration of microbial communities or algal productivity. The biodegradability of DDT analogs was related to their chemical structure. Studies of resting-cell suspensions and cell-free enzyme extracts of two organophosphate-and one carbamate-utilizing bacteria indicated that both constitutive and induced broad, substrate-specific enzymes were responsible for organophosphate and carbamate metabolism. The metabolites of various organophosphates were: dimethyl and diethyl phosphate and thiophosphate, indicating hydrolytic attack on the parent compound by phosphatases. (EIS-Deal)

5A. Identification Of Pollutants

EVALUATION OF THE MC-300A SOIL MOISTURE METER TO DETERMINE IN-PLACE MOISTURE CONTENT OF REFUSE AT LAND DISPOSAL SITES,
Environmental Protection Agency, Cincinnati, OH. Solid Waste Management Office.
R. J. Wigh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 359, Price codes: A02 in paper copy, A01 in microfiche. Progress Report No. SWR-91, 1971. 24 p, 2 fig, 1 tab, 8 ref, 1 append.

Descriptors: *Soil moisture meter, *Landfills, *Degradation, *Moisture content, Solid waste disposal, Waste dumps, Liquid wastes, Sludge, Solid wastes, Moisture meters, Laboratory tests, Testing procedures, Wastes, Municipal wastes.

Preliminary results of a laboratory investigation of the portable soil moisture meter, MC-300A, to determine the in-place moisture content of refuse at land disposal sites are presented. Several samples of fresh and composted refuse with varying moisture contents were prepared, moisture probes were inserted into the samples, meter readings were obtained, and calibration curves were drawn relating the moisture content to the meter readings. The discrepancies noted during the investigation indicated that the instrument was less accurate than first assumed, so that its usefulness is limited to noting changes in moisture rather than specific changes in moisture content. This instrument could be useful for studying movement of moisture fronts, but not for the correlation of moisture content and gas production or temperature. The instrument is further limited by the changing moisture properties due to decomposition, and data obtained should be considered qualitative rather than quantitative. (Davison-IPA)

INVESTIGATION OF ISOTHIOCYANATOPENTAAQUOCHROMIUM (III) AS A REAGENT FOR THE SEPARATION AND IDENTIFICATION OF NANOGRAM QUANTITIES OF MERCURY (I), MERCURY (II), AND METHYLMERCURY (II),
North Dakota Univ., Grand Forks. Dept. of Chemistry.
R. J. Baltisberger, and C. L. Knudson.
Analytical Chemistry, Vol. 47, No. 8, p 1402-1406, July 1975, 1 fig, 5 tab, 22 ref. OWRT B-020-NDAK(3), 14-31-0001-3922.

Descriptors: Analytical techniques, Water analysis, *Mercury, Separation techniques, *Pollutant identification, *Methylmercury, Isothiocyanatopentaaquochromium(III), Mercury complexes, Identification, Separation of mercury species.

The reagent, isothiocyanatopentaaquochromium (III) (CrNCS2+), forms polynuclear species with CH3Hg+, Hg2+, and Hg22+ with the stoichiometry (CrNCS)nMex+ where n equals 1 or 2. An ion exchange procedure was investigated for the separation of nanogram quantities of Me equal to Ch3Hg+, Hg22+, and Hg2+ in water based on the formation of the (CrNCS)nMe complex ions. The three mercury species can be isolated by variation of the eluent acidity. Possible analytical applications for samples containing down to 20 nanograms of mercury are discussed.

Group 5A—Identification Of Pollutants

This research addresses the need for an assessment of field conditions and in-plant effluent toxicity in water-quality management efforts. It develops a sensitive, easily performed test which does not require elaborate facilities or great expense of time or money. It evaluates the toxic effect of selected heavy metals and insecticides on mosquito larvae (Aedes aegypti) by using inhibition of swimming ability to indicate poisoning of the central nervous system. The research describes a photomigration procedure, which differs from standard acute mortality tests, and uses an inexpensive multi-unit apparatus consisting of four glass troughs perpendicular to a uniform light source. Inhibition of larval ability to swim away from light was used as the parameter for determining toxicity. The toxicants tested were the heavy metals copper, cadmium, and hexavalent chromium; and the pesticides carbofuran, methomyl, fenitrothion, fonofos, and phosmet. Results showed that, of the metals, cadmium was most toxic, followed by copper and then chromium. Of the insecticides evaluated, fenitrothion, fonofos, and phosmet were most toxic. The procedure described represents a sensitive means of assessing water quality rapidly and economically.

CATHODIC STRIPPING METHODS FOR THE DETERMINATION OF PHOSPHATE AND ARSENATE IN NATURAL WATERS,
Southern Illinois Univ. at Carbondale.
C. Kuo-hsien.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 382, Price codes: A08 in paper copy, A01 in microfiche. PhD Dissertation, December 1977. 137 p, 37 fig, 10 tab, 83 ref. OWRT A-087-ILL(5), and S-033-ILL(1).

Descriptors: Chemical analysis, Electrochemistry, *Phosphates, *Water analysis, *Arsenate, Ion selective membranes, Trace analysis(Inorganic), Pollutant identification, *Cathodic stripping method.

The oxidation of Fe(II) at a carbon electrode in the presence of phosphate and/or arsenate results in a film of Fe(III) salts of those anions on the electrode surface. Accumulation of the film under controlled conditions occurs in direct proportion to the concentrations of those anions. Subsequent electrochemical reduction of the salt film provides a current which can readily be related to the orignial solution concentration. In this manner phosphate and arsenate can be determined down to 10 micrograms per liter (ppb). Natural water contains several species which can interfere with this method. Hence, a simple pretreatment method which utilizes Donnan dialysis (transfer through an anion exchange membrane) was developed for studies on such samples. The resulting approach, Donnan dialysis followed by electrochemical stripping analysis, provides statistically identical results to those obtained by use of standard methods for the determination of phosphate and arsenate in water and wastewater. Test samples included lake water, river water, and sewage effluent from several sources. The method is more rapid, more sensitive, and less subject to interference.

TECHNIQUES FOR SAMPLING AND ANALYZING THE MARINE MACROBENTHOS,
Corvallis Environmental Research Lab., OR.
R. C. Swartz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 631, Price codes: A03 in paper copy, A01 in microfiche. Report EOA-600/3-78-030, 34 p, March 1978. 2 tab, 18 ref.

Descriptors: *Sampling, *Analytical techniques, *Biological communities, *Benthic fauna, Mathematical studies, Aquatic populations, Data collections, On-site data collections, Monitoring, Testing procedures, Bottom sampling, Water analysis, Chemical analysis, Biomass, *Methodology, *Species diversity, *Tissue analysis.

This report presents guidelines for the quantitative assessment of the effects of marine pollution on benthic community structure and population dynamics. The sampling design addresses the number and location of stations, survey frequency, sampling gear, replication of samples, screening and preservation of biological samples, and the collection of abiotic data. Recommendations are given for the sorting, identification, enumeration, and weighing of benthic specimens. The section on data analysis suggests indices for detecting changes in species composition, density, dispersion, diversity, richness, dominance, spatial-temporal faunal homogeneity. (EIS-Deal)

DETERMINATION OF ALKYLMERCURY COMPOUNDS IN LAKE SEDIMENTS BY STEAM DISTILLATION-FLAMELESS ATOMIC ABSORPTION,
Purdue Univ., Lafayette. Dept. of Agronomy.
M. Floyd, and L. E. Sommers.
Analytical Letters Vol 8 No 8, p. 525-535, 1975. 3 tab, 10 ref. OWRT A-023-IND(3).

Descriptors: *Mercury, *Lake sediments, Water pollution, Gas chromatography, *Pollutant identification, *Alkymercury compounds, Methylmercury, Dimethylmercury, Steam distillation, Atomic absOrption.

Organic mercury compounds in lake sediments were separated into dialkyl- and monoalkylmercury fractions by steam distillation and subsequently quantified by flameless atomic absorption. The method recovered nearly all CH3HgCh3 and Ch3HgCl added to diverse sediments. Parameters influencing the efficacy of the procedure, i.e., Hg concentration, sample size and distillation time, were evaluated.

A bell jar chamber with a clock-driven release mechanism was designed to collect samples of water trapped over undisturbed sediments. Samples taken at 3-h intervals over 24 h were analyzed for dissolved oxygen, carbon dioxide, and total phosphorus, and in situ flux across the subtidal sediment surface was calculated. (Sims-ISWS)

LAKE PROCESS MODELS APPLIED TO RESERVOIR MANAGEMENT,
URS Corp., San Mateo, CA.
W. L. Bradford, and D. J. Maiero.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 104, No. EE5, p 981-996, October 1978. 3 fig, 8 tab, 22 ref.

Descriptors: *Lakes, *Reservoirs, *Management, *New York, *New Jersey, *Pennsylvania, *Trophic level, *Model studies, Eutrophication, Loading, Impoundment, Phosphorus, Predictions, Dissolved oxygen, Mesotrophy, Equations, Simulation analysis, Systems analysis.

Two simplified models of lake processes have been used to predict the trophic state of the proposed Tocks Island Lake to be constructed on the Delaware River, north of Trenton, New Jersey. Using independent estimates of phosphorus entering the lake area via the river, both models predicted that the lake would be eutrophic with hypolimnetic dissolved oxygen demands exceeding 5 mg/l and midsummer Secchi Disk transparency depths as low as 0.6 m. Point source phosphorus loads to the basin were estimated from known wastewater discharges, and nonpoint loads from known land uses and area loading factors. Then proposed measures to reduce the phosphorus load were tested for effectiveness by calculating the proportional decrease in load brought about by each measure and applying the proportion to the phosphorus load entering the lake area. The new load was then used with the models to predict the new trophic state. It was found that very stringent controls would be required to bring a significant change in the trophic state toward mesotrophy. (Bell-Cornell)

NON-POINT SOURCE WATER QUALITY MONITORING, INYO NATIONAL FOREST, 1975,
California Univ., Los Angeles. Environmental Science and Engineering.
A Progress Report, Contribution No. 156, California Water Resources Center, University of California, Davis, March 1976. 138 p, 69 fig, 82 ref, append. Bass, J., Westerdahl, F.D., and Perrine, R.L., Eds.

Descriptors: *Water quality, *Monitoring, *National forests, *California, *Non-point sources, Recreation areas, Wilderness areas, Evaluation, Sampling, Natural environment, Human use, Physical measurements, Chemical analyses, Bacteriological observations.

Presented are the results of a study focused on the impact of non-point sources on water quality in wilderness and recreational areas within the Inyo National Forest in California. One objective was to asses water quality with regard to physical, chemical and bacteriological parameters in a manner permitting evaluation of area-wide sources. A second objective, as an ongoing part of the Center's studies, was to develop improved test methods for continuing water quality monitoring and protection in such areas. Concern was given to increasing understanding of relationships between water quality, the natural environment and human use. The principal effort in these studies involved a monitoring program in which 34 sites selected by the U.S. Forest Service were sampled one or more times during the summer and fall, 1975. (Most sites can be characterized as high altitude, alpine lakes of small to moderate size, or streams, snow-fed from granite basins). All sites represented areas frequented by recreational visitors, and were sampled with their use as a primary concern. Physical measurements included air and water temperature, dissolved oxygen, pH, and total dissolved solids. Chemical analysis included tests for sulfates, nitrate-nitrogen, Kjeldahl nitrogen, chloride, phosphates, total phosphorus and methylene blue active substances. Bacteriological observations included total and fecal coliform organisms and Yersinia enterocolitica. Additional sampling concerned algae in a portion of the lakes studied. A separate research effort by means of laboratory-scale experimental investigation looked into the means of transport of bacteria from sites at which they might be deposited to a nearby water body. (Bell-Cornell)

ENVIRONMENTAL PARAMETERS OF THE TENNESSEE RIVER IN ALABAMA: II. PHYSICAL, CHEMICAL, AND BIOLOGICAL PARAMETERS,
Alabama Univ., in Huntsville. School of Graduate Studies and Research.
L. M. Rosing.
UAH Research Report No. 173, June 1976. 283 p, 163 fig, 16 tab, 17 ref, 3 append. NASA NAS8-30772.

Descriptors: *Alabama, *Tennessee River, *Water quality, *Sampling, *On-site investigations, Data processing, Chemical properties, Biological properties, Physical properties, Chemicals, Hardness(Water), Metal, Water temperature, Fish, Turtles, Benthic fauna, Pollutants, Monitoring, Rivers, Water pollution.

Physical, chemical, and biological data from 5 sites in the Tennessee River, 2 in Guntersville Reservoir and 3 in Wheeler Reservoir, Alabama, were correlated with climatological data for 3 annual cycles. Two of the annual cycles were for the years prior to the Browns Ferry Nuclear Power Plant operations, and one was for the first 14 months of Plant operations. A comparison of the results of the annual cycles indicated two distinct physical conditions in the reservoirs, one during the warm months when the reservoirs are at capacity and one during the colder winter months when the reservoirs have been drawndown for water storage during the rainy months and for weed control. The wide variations of physical and chemical parameters to which the biological organisms are subjected on an annual basis control the biological organisms and their population levels. Comparison of the parameters of the site below the powerplant indicated that the heated effluent from the plant operating with 2 of the 3 reactors has not had any effect on the organisms at this site. Recommendations included the development of prediction math models for the physical and chemical parameters under specific climatological conditions which affect biological organisms. Recommendations also included continuing the weekly sampling at the Wheeler and Browns Ferry site to determine the long-range effect of the Browns Ferry Nuclear Power Plant. (Sims-ISWS)

DETOXIFICATION OF METALS BY MARINE BIVALVES: AN ULTRASTRUCTURAL STUDY OF THE COMPARTMENTATION OF COPPER AND ZINC IN THE OYSTER OSTREA EDULIS,
Institute of Marine Biochemistry, Aberdeen (Scotland).
S. G. George, B. J. S. Pirie, A. R. Cheyne, T. L. Coombs, and P. T. Grant.
Marine Biology, Vol. 45, p 147-156, 1978. 3 fig, 4 tab, 25 ref.

Descriptors: *Metals, *Copper, *Zinc, *Oysters, *Toxicity, *Electron microscopy, *Biological membranes, *Enzymes, *Animal metabolism, Cytological studies, Path of pollutants, Mollusks, Pathology, Animal physiology, *Detoxification, Vesicles, *Tissue analysis, *Bioaccumulation.

An investigation of the mechanisms of detoxification of copper and zinc by the oyster has been carried out using naturally occurring 'green-sick' (contaminated by copper) and unpolluted oysters. Electron microprobe x-ray analysis of tissues in the electron microscope gives direct evidence for the structural compartmentation of copper and zinc in separate, specific, granular amoebocytes. The metals are immobilized in membrane-limited vesicles as different chemical compounds, copper being associated with sulphur and zinc with phosphorus. Chemical analysis of serum and tissues of normal and 'green-sick' oysters indicate that (1) Cu and Zn are accumulated independently, (2) the Cu and Zn in the serum, while higher than in the surrounding sea water, are maintained at a 10-fold smaller level than the tissues, (3) toxicity is reduced by active uptake from the serum into granular amoebocytes, where it is further reduced by compartmentation in membrane-limited vesicles. It is calculated that the individual cell types may contain as much as 13,000 ppm Cu and 25,000 ppm Zn. (EIS-Deal)

APPLICABILITY OF EXISTING METHODS FOR THE DETERMINATION OF THE BIOCHEMICAL OXYGEN DEMAND (BOD) OF INCINERATOR QUENCH WATER,
Bureau of Solid Waste Management, Cincinnati, OH.
D. L. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 946, Price codes: A03 in paper copy, A01 in microfiche. 1970. 41 p, 4 fig, 9 tab, 11 ref, 1 append. EPA-RS-03-68-18.

Descriptors: *Water pollution, *Biochemical oxygen demand, *Water analysis, *Dissolved oxygen analyzers, Laboratory equipment, Sampling, Measurement, Liquid wastes, Incinerators, Water pollution sources, Pollutant identification, Bioindicators, Bioassay, Microorganisms, Winkler test, Quenching, Analytical techniques, Alsterberg(Azide), Modifications, Cooling water.

An investigation of the Alsterberg (Azide) modification of the Winkler (Dissolved Oxygen) method and the Weston and Stack (DO) Analyzer, model 300-B, to assess their applicability in determining the Biochemical Oxygen Demand (BOD) of incinerator quench water is discussed. The interfering substances found were many of the same ones found in samples of lakes, rivers, streams, sewage and industrial waste waters, but they were in lower concentrations. It was found that quench water samples had BOD values ranging from 100 to 300 ppm on a 5-day basis. These samples required a dilution factor to 2.5%, and it is suggested that the analyst use more samples to reduce possible errors in the BOD result. Modification of existing methods was unnecessary, but immediate DO analysis or the seeding technique are not recommended. It is concluded that properly interpreted BOD measurements can serve as an index to water quality. The Alsterberg (Azide) modification of the Winkler method was unsatisfactory for determining BOD measurements on the samples of quench water that were tested. The Weston and Stack Do Analyzer, model 300-B, analyzed the BOD content of the quench water samples successfully. A detailed method for the application of this instrument was written, which includes a newly developed procedure for an easy, fast field calibration check on a properly calibrated DO analyzer. Qualitative tests to determine the applicability of the modified Wenkler method on field samples are included. (Davison-IPA)

DENITRIFICATION IN A MASSACHUSETTS SALT MARSH,
Boston Univ., MA. Dept. of Biology.
W. Kaplan.
PhD Dissertation, 1977. 78 p.

Descriptors: *Salt marshes, *Massachusetts, *Denitrification, Wetlands, Coastal marshes, Tidal marshes, Marsh plants, Aquatic bacteria, Cyanophyta, Nitrates, Ammonia, Nitrogen cycle, Groundwater.

The rate of gaseous nitrogen flux from salt marsh sediments during denitrification was studied using fertilized plots. In all plots, rates of denitrification increased 2 to 3 fold during the summer. There was also fertilized-induced increases in denitrification, particularly in sediments of low marsh Spartina alterniflora. Rates of denitrification ranged from 1.5 g N/sq m/year for control plots to 3.8 g N/sq m/year for fertilized plots. Rates of denitrification in various habitats of the marsh (tidal creek bottoms, panes, high marsh) also increased during the summer months. The most striking increases occurred between sediments of creek bank and high marsh S. alterniflora. Groundwater discharge from surrounding fresh water springs contained high concentrations of nitrate and could be a major source of oxidized nitrogen compounds used in denitrification. The total annual amount of N lost during denitrification was equal to the annual NO3(-) and NO2(-)-N input by groundwater. The potential of marsh sediments to generate nitrate during the oxidation of NH4(+) to NO3(-) was quite high, but these rates will only be realized at depths where oxygen is able to diffuse into the mud from Spartina roots. Under most circumstances, nitrate was rapidly removed from these anoxic sediments. (Steiner-Mass)

ANALYSIS AND CHARACTERIZATION OF TRACE ELEMENTS IN SHALE OIL PRODUCTS BY INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS,
Missouri Univ.-Columbia. Dept. of Chemistry.
P. Shaw.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 421, Price codes: A06 in paper copy, A01 in microfiche. MA Thesis, December 1978. 109 p, 12 fig, 21 tab, 71 ref. OWRT A-106-MO(1), 14-34-0001-8027.

Descriptors: *Instrumental neutron activation analysis, *Trace elements, *Shale oil products, *Oil shale, Water pollution, Heavy metals, Arsenic, *Pollutant identification, Missouri, Green River(MO), Aluminum, Antimony, Bromine, Cerium, Chlorine, Chromium, Cobalt, Copper, Gallium, Gold, Iodine, Iron, Manganese, Mercury, Molybdenum, Potassium, Selenium, Sodium, Sulfur, Tungsten, Vanadium, Zinc.

Trace elements and their mobilization constitute an important consideration in the development of new fossil fuel technologies. Shale oil produced by in situ retorting of soil shale is an alternative fossil energy source. This study deals with the analysis of trace elements in various shale oil products using instrumental neutron activation analysis (INAA). INAA offers several advantages for those elements for which it is applicable. The greatest advantage is the lack of sample preparation prior to analysis, which greatly simplifies the process and prevents sample contamination. The elements for which analyses are reported in this study are aluminum, antomony, arsenic, bromine, cerium, chlorine, chromium, cobalt, copper, gallium, gold, iodine, iron, manganese, mercury, molybdenum, potassium, selenium, sodium, sulfur, tungsten, vanadium, and zinc.

LONG-TERM ASPECTS OF THE ENVIRONMENTAL BURDEN FROM ENERGY PRODUCTION: CO2 AND 3H, (IN GERMAN),
Kernforschungsanlage Juelich G.m.b.H. (West Germany). Programmgruppe Systemforschung und Technologische Entwicklung.
F. Niehaus.
Report Jul-1165, February 1975. 171 p, 69 fig, 12 tab, 149 ref.

Descriptors: *Powerplants, *Air pollution, *Pollutants, *Water cycle, Carbon dioxide, Tritium, Water pollution, Water pollution sources, Model studies, Mathematical models, Electric power, Electric power industry, Electric powerplants, Thermal powerplants, Nuclear powerplants, Energy, Foreign research, Atmosphere, Fossil powerplants.

The subjects of this study were the carbon dioxide and tritium emissions from fossil or nuclear power plants. The analysis of possible effects of alternative strategies to meet future energy demand on the temperature of the atmosphere depends on the mathematical model of the global carbon dioxide cycle whih uses nonlinear differential equations. As there have to be substitutions of fossil power plants by nuclear facilities, another model was constructed to simulate the water cycle of the northern and southern hemispheres. The model makes it possible to compute the effects of tritium emissions in the future. (Sims-ISWS)

TRACE METALS IN SOME FISH SPECIES OF SOUTH CAROLINA,
South Carolina State Coll., Orangeburg. Dept. of Natural Sciences.
A. K. Koli, S. S. Sandhu, W. T. Canty, K. L. Flex, and R. J. Reed.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 328-331, 1978. 1 tab, 5 ref.

Descriptors: *Metals, *Fish physiology, Animal metabolism, *Copper, *Iron, *Zinc, Manganese, *Cadmium, *Mercury, Brown trout, Shrimp, White bass, Catfishes, Freshwater fish, Marine fish, Fish behavior, *Tissue analysis.

Samples of fish from freshwater and saltwater sources of ocean, rivers, and lakes over the state of South Carolina were collected. The fish collected were Shrimp, Silver Snapper, White Bass, Catfish, Mudfish, and Trout. Triplicate samples of fish muscle tissue were analyzed by wet digestion and dry digestion methods. A significant finding of this report is that saltwater fish have more trace metal levels than freshwater fish, and larger fish have higher trace metal levels than smaller fish. Iron and zinc levels were much higher in Shrimp than any other species analyzed. (EIS-Deal)

CADMIUM AND ZINC CONTENT OF FISH FROM AN INDUSTRIALLY CONTAMINATED LAKE,
Purdue Univ., Lafayette. IN. Dept. of Bionucleonics.
B. R. Murphy, G. J. Atchison, A. W. MacIntosh, and D. J. Kolar.
Journal of Fish Biology, Vol. 13, p 327-335, 1978. 2 fig, 3 tab, 27 ref.

Descriptors: *Cadmium, *Zinc, *Sunfishes, *Bass, Industrial wastes, Metals, Fish physiology, Animal metabolism, Chemical wastes, Fish populations, Lakes, Effluents, Path of pollutants, Trophic levels, Size, Spectrophotometry, Chemical analysis, Indiana, *Bioaccumulation, *Tissue analysis, Palestine Lake.

Eleven species of fish from an industrially-contaminated lake were analyzed for whole body cadmium and zinc content by atomic absorption spectrophotometry. Cadmium and zinc content of fish were species related, and most species accumulated these trace metals to levels significantly higher than background. Cadmium content was much more variable than zinc content. Distributions of concentrations of both cadmium and zinc in fish were lognormal, and concentrations of both metals tended to decrease in higher trophic levels. Zinc concentrations significantly decreased as total length increased in three species. (EIS-Deal)

RAPID METHOD FOR DETERMINING CONCENTRATIONS OF BAYER 73 IN WATER DURING LAMPRICIDE TREATMENTS,
Fish and Wildlife Service, La Crosse, WI. Fish Control Labs.
V. K. Dawson, P. D. Harman, D. P. Schultz, and J. L. Allen.
Journal of the Fisheries Research Board of Canada, Vol. 35, p 1262-1265, 1978. 2 fig, 7 ref.

Descriptors: *Lampreys, *Pesticides, *Chemical analysis, *Pollutant identification, Pesticide residues, Chemical properties, Water analysis, Laboratory tests, Testing procedures, Analytical techniques, Great Lakes, Water chemistry, *Lampricides, Bayer 73, *TFM

Two, simple, rapid, sensitive methods were developed for determining the concentration of the lampricide Bayer 73 in stream water. Bayer 73 was extracted from acidified water samples with chloroform and then hydrolyzed to CNA with either acid or base. The CNA was diazotized with sodium nitrite, and an azo dye was formed with either N-(1-naphthyl) ethylenediamine dihydrochloride (after acid hydrolysis) or 1-naphthol (after base hydrolysis). APPLICATION OF HIGH PERFORMANCE LIQUID CHROMATOGRAPHY TO THE STUDY OF DISSOLVED ORGANIC PHOSPHORUS COMPOUNDS RELEASED BY ALGAE,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
S. W. Hixson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 493, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis 74 p, 23 fig, 13 tab, 39 ref. OWRT A-035-TENN(1).

Descriptors: *Chromatography, *Algae, *Phosphates, Analytical techniques, *Dissolved organic phosphorus, *Pollutant identification.

An analytical technique utilizing high performance liquid chromatography (HPLC) for separating the

inositol phosphates was studied. Commercial inositol hexaphosphate (IHP) and inositol monophosphate (IMP) were adequately separated on Aminex A-27 resin with ammonium bicarbonate as the eluent. A breakdown of the organic bound phosphorus to orthophosphate occurred while on the HPLC column. This breakdown procedure could be due to an alkaline hydrolysis process. Chromatograms of solutions initially containing only IHP yielded four peaks which appear to be best ascribed to residual IHP and the intermediate inositol phosphates containing 5, 4, and 2 phosphate groups per molecule. IMP was not an intermediate of IHP hydrolysis on the LC column. Dissolved organic phosphorus compounds released by the culture Chlamydomonas reinhardtii were subjected to preliminary separation on Sephadex G-25. Sephadex G-25 fraction, which was equal to the inositol phosphate elution position, was chromatographed on the HPLC and resulted in only the orthophosphate peak being identified. This HPLC chromatogram showed that a clean-up procedure was needed prior to HPLC separation. Alkaline bromination was chosen since all the non-inositol phosphates would be oxidized. Samples from the culture study were subjected to alkaline bromination and then chromatographed on sephadex G-25 before being placed on the HPLC. The results showed three major peaks which did not match any of the inositol phosphate standards. Alkaline bromination followed by re-chromatographing the Sephadex fractions resulted in one peak at the elution position of IMP, thus providing marginal evidence for the presence of this compound in the culture solution.

CHROMATOGRAPHIC STUDIES OF DISSOLVED ORGANIC PHOSPHORUS COMPOUNDS RESULTING FROM ALGAL CULTURES,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
C. L. McEntyre.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 550, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, August 1976, 125 p, 82 fig, 6 tab, 65 ref, 3 append. OWRT A-035-TENN(2).

Descriptors: *Chromatography, *Algae, *Phosphorus, Compounds, Orthophosphates, *Dissolved organic phosphorus, *Pollutant identification.

Each of the four algae studied released significant amounts of dissolved organic phosphorus (DOP) into the surrounding water. In some instances the amount of DOP exceeds the amount of dissolved inorganic phosphorus (DIP) in the culture system. The DOP produced is a complex mixture of compounds as shown by the number of peaks on some Sephadex profiles and the large number of spots on the thin layer chromatography (TLC) plates of algal samples. The fact that 16 non-DIP peaks appear on the Sephadex profile of this sample, reinforces the conclusion that each peak in a Sephadex profile can be composed of many different compounds. The number of compounds comprising the DOP increases with culture age and then levels off as the culture leaves the log-growth phase and then starts declining in a closed system such as was used in this study. TLC studies of unfractionated algal culture samples indicate that some of the same compounds are released by each of the four algal species. Some of the DOP compounds persist for several weeks in the culture media. These compounds may either by resistant to degradation and/or reutilization by the algae or they may be continually taken up and replaced by further release by the algae. If the first reason is true, the persistent compounds could possibly be metabolic end-products which are relatively refractory. Even if this is so, they may be readily utilizable by other algal species or by bacteria. IMP is one of the compounds which appear to be present in the DOP produced by all four algal species. It also seems to persist in the DOP for several weeks. IHP does not appear to be present in the DOP produced by the four algae at any time during the culture growth periods examined.

THE EFFECT OF ORGANIC CARBON ON THE CONCENTRATIONS OF IRON AND HYDROGEN SULFIDE IN GROUND WATER,
Missouri Univ.-Columbia. Dept. of Geology.
R. N. Stoufer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 555, Price codes: A05 in paper copy, A01 in microfiche. M. A. thesis December 1975. 85 p, 18 fig, 10 tab, 54 ref, append. OWRT B-077-MO(3), 14-31-0001-3608.

Descriptors: Groundwater, *Iron, *Organic carbon, *Sulfides, Microorganisms, *Oxidation-reduction potential, *Missouri, Water supply, Water wells, *Sulfur-reducing bacteria, Ions, Sampling, Dissolved solids, Water pollution.

Twenty water supply wells in northern Missouri were sampled to determine the relationships between dissolved organic carbon and microorganisms on iron and sulfide concentrations in unpolluted ground water. The concentrations of ferrous iron, sulfide, organic carbon, major ions and the pH and Eh were determined on each water sample. Organic carbon and dissolved ferrous iron were readily measureable in samples. Organic carbon was generally present at low levels (2 mg/l). Even though thee was no evidence of coliform or streptococcus microorganisms none of the water samples was sterile. Two to six genera of non-pathogenic bacteria were present in each sample, the majority being nitrate reducers. Sulfate-reducing bacteria were detected in half of the samples. The data suggest that there is a poor correlation between the redox potential and dissolved organic carbon in ground water. The organic carbon content of the rocks appears to be a more important factor in controlling the redox potential of ground water. The data for nitrate-ammonia and sulfate-sulfide indicate that many of the water samples were not in internal equilibrium with respect to oxidation-reduction reactions. (Carpenter-Missouri)

ATRAZINE PERSISTENCE IN A VALENTINE LOAMY FINE SAND PROFILE,
Nebraska Univ., Lincoln. Dept. of Agronomy.
R. H. Hammons.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 492, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, May 1977. 48 p, 1 fig, 17 tab, 42 ref. OWRT B-030-NEB(4), 14-34-0001-5087.

Descriptors: Water quality, *Herbicides, Irrigation, *Atrazine, *Loam, Soil profiles, Sands, Pesticide residues, Path of pollutants, Water pollution.

The persistence data indicate that atrazine dissipation in irrigated Valentine loamy fine sand occurs at a rate greatly exceeding that expected for this soil texture. Atrazine is rapidly degraded in the top 6 inches of soil and mobility data show that the major portion of surface applied atrazine remains in this layer. Atrazine losses by volatilization seemed to occur most prevalently within 1 or 2 days after the initial application. These losses appear to be very dependent on soil moisture and soil temperature. Conversion of atrazine to hydroxyatrazine by photodecomposition or hydroxylation did not seem to cause a major portion of the dissipation of atrazine. The low amount of hydroxyatrazine formation may be related to the fact that this soil has a low exchangeable hydrogen, clay and organic matter content. Therefore, this conversion would not occur readily. The primary factor of atrazine dissipation in these studies has not been clearly shown. The addition of water enhances this dissipation, possibly by increasing or stimulating the microbial population of the soil, or by influencing chemical conversion of atrazine to forms other than hydroxyatrazine. Therefore, in irrigated sandy soils, it appears that contamination of soil or groundwater is not a major problem when recommended rates of atrazine are used.

CHEMICAL ANALYSIS OF MINE DRAINAGE WATERS,
Colorado School of Mines, Golden. Dept. of Chemistry; and Colorado School of Mines, Golden. Dept. of Geochemistry.
T. R. Wildeman, A. J. Wildeman, and R. Ramirez.
In: Molybdenum in Environment, Vol. 2, W. R. Chappell and K. K. Petersen eds., Marcel Dekker Inc., p. 739-751, 1977.

Descriptors: *Pollutant identification, Water pollution, Mine drainage, Water quality, Water chemistry, *Chemical analysis, *Iron, *Sulfates, Analytical techniques, *Colorado(Front range).

A scheme is described for the analysis of the constituents in mine drainage waters, with particular attention being paid to the problems that the high iron and sulfate concentrations might cause in standard analytical methods. Iron, manganese, zinc, copper, sodium, potassium, magnesium, cadmium, and lead can be accurately analyzed in mine drainages using direct analysis by atomic absorption specrometry. However, the matrix can interfere in the analysis of calcium and methods for eliminating the interference using different chelating agents met with only limited success. The analysis of trace amounts of copper, lead, and cadmium in mine drainage by anodic stripping voltammetry appears to be a promising alternate method when solvent extraction cannot be used.

CHEMICAL LIMNOLOGY OF THE NORTH CHANNEL, 1974,
Department of Fisheries and Environment, Burlington (Ontario). Water Quality Branch.
N. D. Warry.
Scientific Series No. 92, 1978, 12 p., 4 fig., 8 ref., 4 tab.

Descriptors: Limnology, *Water chemistry, *Chemical analysis, *Water quality, *Trace elements, Seasonal, Sampling, Data collections, Parametric hydrology, *Canada, Lake Huron, Georgian Bay, *North Channel, *St. Mary's River, *Water exchange.

Analysis of North Channel water collected on seven surveys between April and December 1974 permitted a comprehensive chemical definition of this water body. Using these data, it was possible to define three distinct areas of water in the North Channel. It also was found that the chemical quality of the North Channel is determined mostly by the water quality of the St. Marys River. An estimate of water exchange between the North Channel and Lake Huron was calculated using the chemical data. It indicated that 17% of the total volume of the North Channel may be exchanged during a one-year period. The North Channel is small enough that man's impact on the water chemistry can be seen. This is best demonstrated by its elevated ammonia concentrations. Soluble trace metal concentrations exhibit a seasonal variation in the North Channel, very similar to that observed in Georgian Bay. CHEMICAL LIMNOLOGY OF GEORGIAN BAY, 1974,
Department of Fisheries and Environment, Burlington (Ontario). Water Quality Branch.
N. D. Warry.

Scientific Series No. 91, 1978, 13 p, 6 fig, 19 ref, 4 tab, append.

Descriptors: Limnology, *Nutrients, *Chemicals, *Silicates, *Ions, Alkalinity, Variability, Surface waters, Trace elements, Watersheds(Basins), Epilimnion, Hypolimnion, Data collections, *Canada, *Georgian Bay, *Lake Huron.

Seven complete chemical surveys of Georgian Bay were conducted between April 28 and December 6, 1974. The observed distributions and open water concentrations of seven major ions (Ca, Mg, Na, K, Cl, SO42, alkalinity), six trace metals (Cu, Ni, Fe, Pb, Mn, Zn), and six nutrients (total P, dissolved reactive P, total dissolved P, NO3 + NO2, NH3 and reactive silicate) are presented. Comment on the probable causes of the observed concentrations and their distribution patterns has been included. In addition, the overall chemical composition of Georgia Bay is discussed in terms of its controlling variables. In order of importance these are (1) exchange with Lake Huron, (2) lithology of the drainage basin, (3) the effect of the Frech River, (4) exchange with North Channel and (5) human activity in the drainage basin. THE DETECTION OF HEIGHTENED SEA-WATER COPPER CONCENTRATIONS BY THE MUSSEL MYTILUS EDULISL,
Natural Environment Research Council, Bangor (Wales). Marine Invertebrate Biology Unit.
J. Davenport, and A. Manley.
Journal of the Marine Biological Association of the United Kingdom, Vol. 58(4) 1978; p 843-850, 3 tab, 3 fig, 11 ref.

Descriptors: *Metals, *Copper, Bioassay, Toxicity, Mortality, *Mussels, Molluscs, Animal behaviour, *Laboratory tests, Animal physiology, Water pollution effects, Methodology, Laboratory equipment, *Behavioral reactions, Mytilus edulis.

An acute toxicity threshold of 0.09-0.10 ppm added copper was determined for specimens of Mytilus edulis from the Menai Strait which were exposed to copper (as CuSO4)in a flowing sea-water system. Results are presented which show that the closure response of the mussel to added copper is a three-part process. First, a sharp adduction of the shell valves is seen at a mean total copper concentration of only 0.021 ppm, then as the copper concentration rises, 'testing' behaviour is observed and finally the shell valves close to isolate the animal from its environment. The complete valve closure mechanism only operates at added copper concentrations of 0.2 ppm or more. The initial behavioural reaction of valve adduction at low concentration occurred at a significantly higher mean total copper concentration (0.16 ppm) in mussels which had been previously acclimated to 0.02 ppm total copper in sea water for 10 days. (EIS-Katz)

PLANT COMPETITION FOR ATRAZINE,
Nebraska Univ., Lincoln. Dept. of Agronomy.
D. W. Hoffman.
Available from the National Technical Information Service, Sprinfield, VA 22161 as PB-291 556, Price codes: A04 in paper copy, A01 in microfiche. Ph.D. Dissertation, December 1976. 49 p, 6 fig, 18 tab, 21 ref. OWRT B-030-NEB(3), 14-34-0001-5087.

Descriptors: *Herbicides, *Atrazine, *Bioassay, Pesticide residues, Soil analysis, Plant population, Oats, Soybeans.

Greenhouse plant bioassays were initiated to study the effects of plant competition for herbicide residues present in soil. Oats and soybeans were grown in studies to determine the effects of plant population on bioassay sensitivity. Improved bioassay sensitivity to trace levels of atrazine was found by decreasing the number of plants per pot. Optimum sensitivity observed on 450 g of Sharpsburg silty clay loam was at 0.06 ppmw atrazine using five oat plants per pot. The lowest detectable atrazine concentration using soybeans was 0.1 ppmw when 1 or 2 plants were grown per 450 g Keith silty loam. At high plant populations, a loss of sensitivity occurred. However, when higher atrazine concentrations were present in soil, increased plant populations allowed these high levels to be quantitatively measured. A 14C-labeled atrazine study showed that by increasing plant populations from 1 to 6 per pot, atrazine uptake was decreased 50% on a per plant basis. This indicated that plants within the pot were competing for the available atrazine.

5B. Sources Of Pollution

THE CONTAMINATION OF GROUNDWATER BY HEAVY METALS FROM THE LAND DISPOSAL OF FLY ASH,
Notre Dame Univ., IN. Dept. of Civil Engineering.
T. L. Theis, and J. J. Marley.
Report No. TID-27019, December 1975. 7 p, 2 fig, 2 tab. E-(11-1)-2727.

Descriptors: *Water quality control, *Water pollution sources, *Heavy metals, *Groundwater, Mercury, Cadmium, Zinc, Fly ash, Adsorption, Soil chemical properties, Acidity, Alkalinity, Air pollution effects, Sorption, Desorption, Hydrogen ion concentration.

The continuing investigation of heavy metal sorption onto various soils is reported. Emphasis is on the effect of environmental variables in groundwater on the adsorption of heavy metals. An illustration of the effect of pH for cadmium and zinc isotherms show variations suggesting that neutral pH's favor formation of hydroxides, and in doing so, enhance sorption onto soil particle surfaces. Ash type and solution pH influence the desorption of metals from ash particles, and it is concluded that the greater the adsorption tendency of a given metal onto the soil particles, the less its tendency to desorb from the ash. Results of the investigation of mercury release from fly ash show that most ashes released very little mercury over the one day test period, however, several showed that the released mercury was in the elemental form. This mercury is volatile and could disappear from fly ash disposal sites before entering the groundwater environment. The total amount of mercury released for fly ash no. 6 was less than 1% of the total amount contained in the ash. (Davison-IPA)

A REPORT ON THE CONCENTRATION, DISTRIBUTION AND IMPACT OF CERTAIN TRACE METALS FROM SEWAGE TREATMENT PLANS ON THE CHESAPEAKE BAY,
Chesapeake Research Consortium, Inc., Annapolis, MD.
R. J. Huggett, O. P. Brucker, G. R. Helz, and S. E. Sommer
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 735, Price codes: A02 in paper copy, A01 in microfiche. Report No. NSF-RA-E-74-030, CRC No. 31, Virginia Institute of Marine Science Contribution No. 628, June 1974. 19 p, 2 fig, 5 ref. GI-38973.

Descriptors: *Sewage treatment, *Chesapeake Bay, *Trace metals, *Shellfish, Ecosystems, Biota, Effluents, Design criteria, Toxins, Water pollution, Sediments, Sediment rates, Deposition, Sediment yield, Sewage treatment plant sites, Water pollution sources, Oysters, Cadmium, Copper, Chromium, Lead, Zinc.

Preliminary findings of research directed towards ascertaining the impact of metals from sewage treatment plants on the Chesapeake Bay ecosystem, and towards defining the physical-chemical-biological dynamic of these metals once in the estuarine environment are summarized. Metals in sewage and receiving waters, sewage metals in bottom sediments, and sewage metal uptake by oysters are discussed. Trace metals are now entering the Chesapeake Bay from sewage treatment plants in quantities which rival nature. It is recommended that inputs of the potentially toxic metals, cadmium, copper, chromium, lead and zinc, be considered in the design and siting of sewage treatment plants on the Chesapeake Bay. Processes for removing these metals from sewage should be incorporated into treatment designs for plants constructed near production shellfish beds, because accumulations of these metals in the shellfish may render them unusable by man. CHARACTERIZATION AND EVALUATION OF WASTEWATER SOURCES, UNITED STATES STEEL CORPORATION, IRVIN PLANT, PITTSBURGH, PENNSYLVANIA, AUGUST 18-28, 1975.
National Enforcement Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 588, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-330/2-75/012, December 1975. 73 p, 5 fig, 9 tab, 7 ref, 4 ap.

Descriptors: *Industrial wastes, *Steel plants, *Monogahela River, *Water quality, Effluents, Water pollution, Organic compounds, Oil, Water pollution sources, Outfall sewers, Monitoring, On-site investigations, Waste water treatment, Neutralization, United States Steel Corporation, Coagulation, Filtration, Oil wastes, Domestic wastes, Pennsylvania, Organic compounds.

United States Corporation's (USSC) Irvin Plant, primarily a steel finishing operation, uses an estimated maximum of 70 mgd of process water from the Monogahela River. Waste water is discharged to the river from two permit discharge points designated as 005 and 006. Waste water treatment facilities located at this plant consist of acid neutralization treatment, waste oil treatment, and domestic waste water treatment. Waste oil treatment effluent is discharged through outfall 005 and domestic effluent through outfall 006. Acid neutralization wastes are transported by railroad tank car to an approved dump for disposal. Waste water discharges from outfalls 005, 006, 106, 306 and 406 were monitored; raw and treated water from the Monogahela were sampled to ascertain the net pollutant concentrations discharged; influent and effluent from the oil waste treatment system was sampled; and flow was measured and pollutant loads calculated for each outfall excepting the oily waste treatment system. During the National Enforcement Investigations Center (NEIC) monitoring period, flows ranged from 13.5 to 18.9 mgd; company self-monitored data was reported at 6.6 to 12.5 mgd. USSC proposed effluent limitations for total suspended solids, oil, grease and dissolved iron are compared with the survey data. Monitoring results and requirements for all outfalls are examined. Descriptors: *Forest management, *Water quality, Chemical properties, *Stream pollution, Road construction, Road design, Reforestation, Sheet erosion, Turbidity, *Piedmont, *Southern Appalachian Mountains, North Carolina, South Carolina.

Soil and nutrient pollution of streams caused by woods roads, log skidding, mechanical site preparation, and prescribed burning are being studied in the Piedmont and Appalachian Mountains of the Carolinas. Stormflow from disturbed areas is measured by 1-foot H-flumes. Proportional samples for sediment and nutrient analysis are collected by 2-foot Coshocton wheels. Objectives of nonpoint source pollution studies are to establish baseline levels of soil and nutrient loss, determine increases in losses due to certain forestry practices, and develop methods of estimating losses for other practices and other locations. WATER QUALITY ASSESSMENT MODEL - OXYGEN DYNAMICS MODEL FOR LOW-FLOW STREAMS,
Civil and Environmental Engineering Development Office, Tyndall AFB, FL.
S. P. Shelton.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-045 463, Price codes: A03 in paper copy, A01 in microfiche. Air Force Systems Command, Report CEEDO-TR-77-15, March, 1977, NTIS, 27 p, 23 ref.

Descriptors: *Mathematical models, *Water quality, *Oxygen, Mathematical studies, *Streams, Stream flow, Biochemical oxygen demand, Water pollution effects, *Waste assimilative capacity, Waste dilution, Waste water disposal, Oxygen demand, Oxygen requirements, Oxygenation, Low-flow nitrogen compounds.

This investigation was undertaken to develop a low-flow stream waste assimilation model to determine the effect of point source discharges at selected Air Force installations. The impetus for this study was the lack of available low-flow stream models and the AF need to evaluate low-flow streams that traverse their installations. From data acquired by this and previous investigations, an analysis of oxygen sinks and sources, unique in their level of significance for low-flow streams, was undertaken. Oxygen sources and sinks considered were carbonaceous BOD, nitrogenous BOD, stream reoxygenation, benthic oxygen demand, and photosynthesis/respiration. In addition to these, the effects of toxic pollutants upon biological reaction rates and waste assimilative capacity were also explored. Techniques employed in this investigation may be considered as one approach to determine waste assimilation capacity and to simulate variations in the oxygen profile caused by point source wastewater discharges into a low flow stream. The validity and limitations of the overall approach, the ability to extrapolate oxygen profiles, and the ability to transpose conditions to facilitate prediction of future conditions is, at this time, not fully substantiated; however, positive indications have been obtained in model verification that lend credence to the procedures adopted. Future studies should be directed toward validation and improvement of the proposed model and sensitivity analysis to define confidence intervals. (EIS-Katz)

CONCENTRATIONS OF TEN HEAVY METALS IN SOME SELECTED LAKE POWELL GAME FISHES,
New Mexico Univ., Alburguerque. Dept. of Biology.
R. E. Bussey, D. E. Kidd, and L. D. Potter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 026, Price codes: A05 in paper copy, A01 in microfiche. Lake Powell Research Project Bulletin No 34, J. M. Varady, Ed., 72 p, November 1976, 9 tab, 13 fig, 37 ref.

Descriptors: *Metals, *Freshwater fishes, *Iron, Arsenic compounds, *Cadmium, Calcium, *Chromium, *Copper, *Lead, *Magnesium, *Selenium, *Zinc, Public health, Path of pollutants, Water pollution effects, New Mexico, Rainbow trout, Bass, *Lake Powell.

Ten tissue samples from each of four species of fishes--large-mouth bass, black crappie, walleye, and rainbow trout--from Lake Powell were analyzed and compared for the presence of concentrations of ten heavy metals: iron, calcium, magnesium, copper, chromium, cadmium, zinc, arsenic, selenium, and lead. Samples were digested with nitric and perchloric acids, and analyses were performed by atomic absorption spectrophotometry. Concentrations were expressed on a dry-weight basis for all tissues and were not corrected for percent recovery. Since cadmium, lead, arsenic, and selenium are toxic to humans, the concentrations of these heavy metals in the edible portions of Lake Powell fishes were compared to the maximum safety threshold levels established in several independent studies. At this time, none of the metals, aside from selenium, appears in concentrations high enough to pose a health hazard and should not be cause for concern. However, the high selenium levels in fish flesh may constitute a possible health hazard, although little is known of the factors influencing selenium assimilation in humans. (EIS-Katz)
W79-02582

CONSEQUENCES OF LEACHING FROM PULP AND PAPER MILL LANDFILL OPERATIONS.
Econotech Services Ltd., New Westminster (British Columbia).
Canadian Forestry Service, Ottawa, Ontario K1A OH3, Cooperative Pollution Abatement Research (CPAR) Project Report 363-1, Progress Report to March 31, 1976, 176 p. 2 fig, 21 ref, 48 tab, 2 append.

Descriptors: *Pulp wastes, *Solid wastes, *Landfills, *Leaching, Wastes, Industrial wastes, Waste disposal, Bark, Sludge, Fuels, Sawdust, Leachate, Hydrogen ion concentration, Metals, Ions, Biochemical oxygen demand, Color, Carbon, Methane, Hydrogen sulfide, Wood, Pulp and paper industry, Water pollution sources, Toxicity, Fish, Gases.

Nine paper-industry solid wastes (Douglas-fir bark, western red-cedar bark, biological sludge, several clarifier solids, salt water dredgings, and sawdust hog fuel) were placed in specially designed lysimeters to determine the characteristics of leachates from a simulated 100-inch annual rainfall. Results showed considerable differences between leachates from various sources. Depending on landfill material, leachates can have highly undesirable characteristics, such as low pH and high metal ion content, fish toxicity, total organic carbon, BOD, and color. Some mateials evolve considerable quantities of methane and hydrogen sulfide. With some exceptions, most of the undesirable properties diminished considerably over the first year of study. Settling rates were determined for all materials. Certain soils were effective in removing many undesirable characteristics, but this limited experiment did not include measurement of soil capacity. Overall results clearly indicate that severe leachate problems may arise from landfill disposal of pulp and paper mill waste products or from storage of bark and wood; leachates from bark or wood can be equally undesirable. Biodegradability can vary considerably between leachates. Results of field studies were analyzed in the light of pilot-plant data. The worst material studied, particularly with respect to long-lasting adverse characteristics, was combined clarifier solids from a bleached kraft operation. (Brown-IPC)

Studies on the fate of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) have been conducted on biodegradation plots and field test areas that have received

massive quantities of Orange herbicide. From the studies reviewed in this report, it is apparent that (1) although TCDD may persist in the environment for long periods of time (greater than 12 years) when initially present in high concentrations on the soil surface, it may be degraded by soil microorganisms, especially when in the presence of other chlorinated hydrocarbons: (2) TCDD may accumulate in the tissues of rodents, reptiles, birds, fish, and insects when these organisms are exposed to TCDD contaminated soils (however, the levels of TCDD in the tissues apparently do not exceed the levels of TCDD found in the environment; and (3) rodents, reptiles, birds, fish and insects may tolerate, i.e., based on no observed deleterious effects in field studies, soil levels between 10-1,500 ppt TCDD. IMPACT OF FLOW REGULATION AND POWER PLANT EFFLUENTS ON THE FLOW AND TEMPERATURE REGIMES OF THE CHATTAHOOCHEE RIVER -- ATLANTA TO WHITESBURG, GEORGIA,
Geological Survey, Doraville, GA. Water Resources Div.
R. E. Faye, H. E. Jobson, and L. F. Land.
Open-file report 78-528, 1978. 92 p, 31 fig, 10 tab, 21 ref.

Descriptors: *Regulated flow, *Streams, *Powerplants, *Heat flow, *Water temperature, Model studies, Mathematical models, Heat transfer, Unsteady flow, Thalweg, Mannings equation, Roughness(Hydraulic), Diurnal distribution, Temperature, *Georgia, *Chattahoochee River(Geo).

A calibrated and verified transient-flow temperature model was used to evaluate the effects of flow regulation and powerplant loadings on the natural temperature regime of the Chattahoochee River in northeast Georgia. Estimates were made of both instantaneous and average natural temperatures in the river during an 8-day period in August 1976. Differences between the computed average natural temperature and an independent estimate of natural temperature based on observed equilibrium temperatures were less than 0.5C. The combined thermal effects of flow regulation and powerplant effluents resulted in mean daily river temperatures downstreams of the powerplants about equal to or less than computed mean natural temperatures. The range and rates of change of computed natural diurnal temperature fluctuations were considerably less than those presently observed (1976) in the river. Except during periods of peak water-supply demand, differences between computed year 2000 river temperatures and observed present-day temperatures were less than 2C. (Woodard-USGS)
W79-02648

EFFECTS OF BOTTOM SEDIMENTS ON INFILRATION FROM THE MIAMI AND TRIBUTARY CANALS TO THE BISCAYNE AQUIFER, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
W. L. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 080, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 78-36, May 1978. 63 p, 29 fig, 6 tab, 20 ref.

Descriptors: *Groundwater recharge, *Surface waters, *Infiltration, *Water quality, *Canals, Water supply, Aquifers, Withdrawal, Water wells, Saline water intrusion, Drawdown, Bottom sediments, Effects, Canal seepage, Data collections, Water analysis, Chemical analysis, Path of pollutants, *Florida, Dade County(Fla), *Biscayne aquifer(Fla).

Infiltration from the Miami Canal and its tributaries is an important source of recharge to the Biscayne aquifer in the vicinity of the Miami Springs-Hialeah well fields. Estimates of pumpage contributed by canal infiltration decreased from nearly 100 percent in the late 1940's to 50 percent in May 1973 while well field pumpage increased from less than 50 Mgal/d to 120 Mgal/d. As increased withdrawals enlarge the well field's cone of depression, the threat of saltwater intrusion during dry periods has been increased. Data on water quality, water levels, and canal bottom sediments indicate that sediments greatly impede infiltration from the canals in the areas most affected by pumping. Bottom sediments reduce coliform bacteria, pesticides, PCB, metals, and other suspended materials infiltrating canal water. (Woodard-USGS)

BACTERIOLOGICAL WATER QUALITY OF TULPEHOCKEN CREEK BASIN, BERKS AND LEBANON COUNTIES, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
J. L. Barker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 403, Price codes: A02 in paper copy, A01 in microfiche. Water-Resources Investigations 78-53, April 1978. 25 p, 5 fig, 5 tab, 10 ref.

Descriptors: *Water quality, *Baseline studies, *Water pollution sources, *Coliforms, *Bacteria, Livestock, Surface waters, Runoff, Water analysis, Evaluation, *Pennsylvania, *Tulpehocken Creek basin(Penn), Proposed lake site.

A four month intensive study of the bacteriological quality of water in the Tulpehocken Creek basin in southeast Pennsylvania indicates that (1) the streams localy contain high densities of bacteria indicative of fecal contamination, (2) nonpoint waste sources, particularly livestock, are the dominant influence in the excessive bacteriological-indicator counts observed, and (3) retention time of water in the proposed Blue Marsh Lake is believed sufficient to reduce bacteria densities to acceptable levels except following intense rainfall and runoff events during normally low-flow periods. Descriptors: *Water quality, *Urban runoff, *Sewage effluents, *Storm runoff, *Water analysis, Dissolved solids, Dissolved oxygen, Hydrogen ion concentration, Ammonia, Nitrogen, Phosphorus, Biochemical oxygen demand, Bacteria, Coliforms, Metals, Trace elements, Water temperature, Path of pollutants, *Illinois, *Sugar Creek(Ill), Bloomington, Normal(Ill).

Urban runoff and overflows from combined sewers affect water quantity and quality in Sugar Creek within the twin cities of Bloomington and Normal, Illinois. Water-quality data from five primary and eight secondary locations showed three basic types of responses to climatic and hydrologic stresses. Stream temperatures and concentrations of dissolved oxygen, ammonia nitrogen, total phosphorus, biochemical oxygen demand, and fecal bacteria showed seasonal variations. Specific conductivity, pH, chloride, and suspended solids concentrations varied more closely with stream discharges. Total organic carbon, total nitrogen, total phosphorus, biochemical oxygen demand, and fecal coliform and fecal streptococcal bacteria concentrations exhibited variations indicative of intial flushing action during storm runoff. Selected analyses for herbicides, insecticides, and other complex organic compounds in solution and in bed material showed that these constituents were coming from sources other than the municipal sanitary treatment plant effluent. Analyses for 10 common metals: arsenic, cadmium, chromium, copper, iron, lead, manganese, mercury, nickel, and zinc showed changes in concentrations below the municipal sanitary plant outfall. Descriptors: *Nitrates, *Fluorides, *Groundwater, *Water quality, *California, *East Highlands, San Bernardino County(Calif).

In the Highland-East Highlands area of southern California, concentrations of nitrate in water from many wells exceed the U.S. Environmental Protection Agency's and the California Department of Health's recommended limit for public water supplies. The nitrate standards for public water supplies in the study area are commonly met by blending the high-nitrate water with low-nitrate water before distribution; however, some of the low-nitrate water sources have fluoride concentrations that exceed the optimum level, or in a few cases exceed the maximum level recommended by the California Department of Health. Nitrate-nitrogen concentrations in the study area are generally between 1 and 20 milligrams per liter. In general, nitrate-nitrogen concentrations exceeding 10 milligrams per liter are found in water from wells perforated at depths of less than 500 feet. (Woodard-USGS)

PRELIMINARY HYDROLOGIC BUDGET OF THE SAND-AND-GRAVEL AQUIFER UNDER UNSTRESSED CONDITIONS, WITH A SECTION ON WATER-QUALITY MONITORING, PENSACOLA, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. Trapp, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 183, Price codes: A04 in paper copy, A01 in microfiche Water-Resources Investigations 77-96, 1978. 57 p, 8 fig, 1 tab, 24 ref.

Descriptors: *Computer models, *Aquifer characteristics, *Hydrogeology, *Water quality, *Path of pollutants, Hydrologic budget, Sewage effluents, Groundwater movement, Potentiometric pollut-

ants, Hydrologic budget, Sewage effluents, Groundwater movement, Potentiometric level, Transmissivity, Confined water, Water analysis, Nutrients, Biochemical oxygen demand, Water wells, Withdrawal, Groundwater recharge, *Florida, *Escambia County, *Pensacola(Fla), *Trescott-Pinder model, Sand-and-gravel aquifer, Effluent-spray disposal.

The sand-and-gravel aquifer is the only freshwater aquifer in southern Escambia County, Fla. Problems related to the development of the aquifer include sustained yield, contamination, and saltwater intrusion. A digital model was applied to the sand-and-gravel aquifer in central and southern Escambia County treating the aquifer's 'main producing zone' as a discrete, leaky, confined aquifer. Under conditions of no pumping, most values for the final-head matrix agreed with assumed values within 4 feet in the area of principal interest. Discharge per unit land area was 1.04 cubic feet per second per square mile, in close agreement with the base runoff streams maintained by the aquifer. Total natural aquifer discharge within the area of principal interest determined by the model was 159 million gallons per day. The applicability of the present non-unique calibration for predicting the effects of pumping is questionable; a multilayered model may be required. Effluent infiltrating from holding lagoons for spray irrigation at the Scenic Hills Sewage Plant may have affected the quality of local perched ground water in the sand-and-gravel aquifer. Observation wells drilled near areas of heavy pumping around Bayou Chico indicated no saltwater intrusion. (Woodard-USGS)

THE INFLUENCE OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION, COMPOSITION, AND TRANSPORT OF MICROBIAL BIOMASS AND SUSPENDED MATERIAL IN A SALT MARSH ECOSYSTEM,
South Carolina Univ., Columbia.
C. W. Erkenbrecher, Jr.
PhD Dissertation. 1976. 210 p.

Descriptors: *Salt marshes, *Aquatic microorganisms, *Organic matter, Wetlands, Tidal marshes, Coastal marshes, Aquatic fungi, Chlorophyll, Detritus, Tides, Aquatic bacteria, Suspended load, Sediment transport, Productivity, Estuaries, *South Carolina.

The North Inlet Estuary near Georgetown, South Carolina, was the site for the study of the interactions among aquatic microorganisms and the constantly changing physical and chemical environments. Seasonal fluctuations in water properties were superimposed over the tidal and diurnal factors. Peak concentrations of adenosine triphosphate (ATP) in the summer months coincided with increases in the amount of chlorophyll a. The appearance of peak concentrations of particulate organic carbon (POC) in the early fall was associated with the die-off and washout of components of the standing crop of Spartina. The strong linear correlation between POC and fungi suggested that the latter were attached to and possibly important in the breakdown of the POC formation. Increases in bacterial abundance were generally associated with substantial periods of fresh water runoff in the winter. Critical differences in magnitude and direction of transport were observed between consecutive tidal cycles due to changing local environmental conditions. Biomass carbon was exported from the marsh at a rate of 6 kg per tidal cycle. This was about 19% of the total POC transported. Occasionally, the resuspension of fine sediments on a flooding tide resulted in a significant import of biomass to the creed. (Steiner-Mass)

VOLATILE CHLORO- AND BROMOCARBONS IN COASTAL WATERS,
Maryland Univ., College Park, Dept. of Chemistry.
G. R. Helz, and R. Y. Hsu.
Limnology and Oceanography, Vol. 23, No. 5, p 858-869, September 1978. 6 fig, 5 tab, 41 ref. EPA R803839-01/02.

Descriptors: *Water quality, *Chlorination, *Effluents, *Estuaries, *Maryland, Halogens, Chlorine, Carbon, Bromine, Salinity, Volatility, Sampling, Surveys, Rivers, Coasts, Sewage effluents, Analytical techniques, Data processing, Sea water, Chemicals, Chemical analysis, Pollutants, Path of pollutants, Water pollution, *Haloforms, *Back River(MD), Chlorocarbons, Bromocarbons.

Contaminated coastal waters can contain nanomolar levels of C1 and C2 halocarbons originating through in situ synthesis from chlorine and through waste discharge. Haloforms are the major volatile products formed from chlorine. In freshwaters, CHC13 dominates with lesser amounts of CHBr3 and the mixed C1-Br haloforms; however, above about 5 g/kg salinity, CHBr3 is virtually the only product when typical chlorine doses (10-100 micro M) are used. On a molar basis, greater than 4% conversion of chlorine to haloforms was observed in some experiments. Samples from the Back River estuary (Maryland), which receives effluent from a very large urban wastewater treatment plant, contained CH2C12, CHC13, CC14, CC12=CHC1, and CC12=CC12 at concentrations exceeding 1 nM. Even when winter ice cover minimized loss of volatilization, downstream mixing was nonconservative, suggesting that chemical or biological degradation processes occur. Under normal circumstances, however, volatilization followed by chemical degradation in the atmosphere is probably the most important loss mechanism. Data on possible biologic effects of these compounds are critically needed. (Sims-ISWS)

N15/N14 RATIOS OF GROUND-WATER NITRATE, LONG ISLAND, NEW YORK,
Texas Univ. at Austin. Bureau of Economic Geology.
C. W. Kreitler, S. E. Ragone, and B. G. Katz.
Ground Water, Vol. 16, No. 6, p 404-409, November-December 1978. 3 fig, 2 tab, 19 ref.

Descriptors: *Groundwater, *Nitrates, *Isotope studies, *New York, Nitrogen, Water pollution, Fertilizers, Agriculture, Farm wastes, Septic tanks, Pollutants, Path of pollutants, Aquifers, Analytical techniques, Wells, Water wells, Water quality, Water pollution sources, *Long Island(NY).

Nitrogen-isotope values (delta N15) of groundwater nitrate on Long Island, New York, correlate with delta N15 ranges of nitrate sources which contribute to the groundwater systems. The delta N15 of nitrate in water from the upper glacial aquifer, the water table aquifer on Long Island, shows a shift from lighter values in the eastern part of the island where land is used predominantly for agriculture, to heavier values toward New York City where land is used for suburgan residences with septic systems or sewers. The delta N15 values for inorganic fertilizer, unfertilized cultivated fields, and animal wastes show a similar shift from low to high values: -3 to +2 parts per thousand, +2 to +8 parts per thousand, and +10 to +20 parts per thousand, respectively. Nitrogen-isotope ratios of nitrate in water from the deeper Magothy aquifer indicate a mixed source of nitrate. (Sims-ISWS)

SIMULATION OF NUTRIENT LOSS FROM SOILS DUE TO RAINFALL ACIDITY,
Corvallis Environmental Research Lab., OR.
J. O. Reuss.
Publication No. EPA-600/3-78-053, May 1978. 45 p, 12 fig, 4 tab, 18 ref.

Descriptors: *Rainfall acidity, Water analysis, Water chemistry, Soil science, Soil chemistry, Plant nutrition, Ecology, *Simulation analysis, *Model studies, *Nutrients.

A simulation model is described that provides a quantitative system utilizing established relationships from soil chemistry to predict the most likely effect of rainfall acidity on the leaching of cations from noncalcareous soils. The model utilizes the relationships between lime potential (pH - 1/2pCa) and base saturation described by Clark and Hill (Soil Sci. Soc. Amer. Proc. 28:490-492, 1962) and Turner and Clark (Soil Sci. 99:194-199, 1964), the equilibrium between CO2 partial pressure and H+ and HC03- in solution, the apparent solubility product of AL(OH)3, the equilibrium of cations and anions in solution, the Freundlich isotherm description of ions between the solution and sorbed or exchangeable phases. Ionic composition of leachates in response to rainfall composition can thus be computed. Ions considered in the present version are H+, Ca2+, Al3+, SO42-, CL-, and HC03-. The model predicts almost exact chemical equivalence between basic cation removed in the leachate and strong acid anions entering the system in the rainfall of pH - 1/2pCa is above 3.0, at which point the base saturation will generally not exceed 20%. At lower pH - 1/2pCa values leaching of anions in association with H+ and Al3+ becomes significant and these cations predominate when pH - 1/2pCa falls below 2.0. (Skogerboe-Colorado State)

TRANSPORT OF AGRICULTURAL CHEMICALS FROM SMALL UPLAND PIEDMONT WATERSHEDS,
Environmental Research Lab., Athens, GA.
C. N. Smith, R. A. Leonard, G. W. Langdale, and G. W. Bailey.
Publication No. EPA-600/3-78-056, May 1978. 364 p, 96 fig, 177 tab, 41 ref, 8 append.

Descriptors: Herbicides, Fertilizers, *Pesticides, Surface runoff, *Small watersheds, *Agricultural chemicals, *Path of pollutants, Water pollution sources, *Southeast US, Southern Piedmont region.

Data were collected from four small watersheds (1.3 to 2.7 ha) located in the Southern Piedmont region. Two watersheds were managed without conservation measures; the other two watersheds were parallel-terraced and included grassed waterways for soil erosion control. Total losses of applied herbicides were affected by the occurrence of runoff in close proximity to application date, mode of application, and persistence in the soil runoff zone. Most of the total annual losses by runoff were in the first three runoff events for all compounds except paraquat. Runoff of trifluralin was very low (0.1 to 0.3% of the annual application). Total runoff losses of other herbicides were commonly less than 1.0% except when runoff occurred shortly after application. Sediment yield from terraced watersheds was significantly less than from watersheds managed without terraces.

Except for paraquat, however, pesticide yields in runoff were not reduced in proportion to sediment reduction because solution transport was the major mode of loss for the soluble herbicide phase. Annual runoff losses of soluble plant nutrients were 5.0 and 1.3 kg/ha for chloride and nitrate, respectively. Losses of soluble phosphorus from both watersheds were very low, about 380 g/ha. CHEMICAL CHARACTERISTICS OF A FEEDLOT SOIL PROFILE,
Agricultural Research Service, Lincoln, NE.
G. E. Schuman, and T. M. McCalla.
Soil Science, Vol. 119, No. 2, p 113-118, February, 1975. 6 fig, 2 ref.

Descriptors: *Feedlots, *Soil profiles, *Soil chemical properties, Nitrates, Potassium, Impermeable layer.

This study was made to determine the chemical composition of feedlot profiles, which might be helpful in understanding the characteristics of feedlot soil profile and the effects of the observed characteristics on the profile. The exchange complex was predominantly saturated with K in the top 15 cm of the soil profile immediately below the manure pack. Ca became the dominant ion below that depth. The high K resulted from large amounts of K in the rations fed to the livestock. The zone where high levels of K were present was also high in carbon. This zone was very dark and slightly more dense than the material above and below. The permeability of this dark layer was low. Soil columns leached with CaC12 allowed percolation to occur, which indicated that the sealing was at least partially due to the K. No percolate resulted from the distilled water of KC1 solution treatments. NO3-N was very low under the impermeable layer and severalfold higher in the field profile. (Cartmell-East Central Oklahoma)

STABILITY OF HUMAN ENTEROVIRUSES IN ESTUARINE AND MARINE WATERS,
Maryland Univ., College Park. Dept. of Microbiology.
S. Lo, J. Gilbert, and F. Hetrick.
Available from the Natinal Technical Information Service, Springfield, VA 22161 as AD-A033 356, Price codes: A02 in paper copy, A01 in microfiche. Applied and Environmental Microbiology, Vol. 32, No. 2, p. 245-249, August 1976. 5 p, 4 fig, 3 tab, 12 ref. N0014-67-0239-0035.

Descriptors: *Enteric viruses, *Water pollution sources, *Estuaris, *Estuarine environment, *Marine environment, Laboratory tests, On site tests, Salinity effects, Saline waters, Temperature effects, Water temperature, Viability, Microbiology, Viruses, Human diseases, Water pollution effects.

Three enteric viruses, poliomyelitis type 1, echoviurus-6, and coxsackieviurs B-5, were studied to determine the effects of temperature and salinity on their survival. Marine and estuarine in situ studies and controlled laboratory studies conducted indicated that temperature rather than salinity is the critical factor affecting their stability: higher temperatures resulted in a more rapid loss of viral activity. All the viruses were stable at 4C, with coxsackievirus B-5 being the most stable, showing activity after 53 weeks incubation at all salinities in the laboratory. In situ study results indicated that these viruses are more labile in natural waters than in artificially prepared marine and estuarine waters. Coxsackievirus B-5 was the most stable under all conditions, echovirus-6 was intermediate, and poliovirus type 1 was the least stable. (Davison-IPA)

CHARACTERIZATION OF PRODUCT TANKER SLOP WATERS,
Exxon Research and Engineering Co., Florham Park, NJ. Environmental Control and Safety Div.
J. E. Shewmaker.
Available from the National Technical Information Service, Springfield VA 22161 as PB-254 987, Price codes: A04 in paper copy, A01 in microfiche. Final Report Nos. MA-RD-930-76054 and EE.10TMR.76, June 1976. 53 p, 1 fig, 28 tab, 20 ref, 1 append. C-5-3800.

Descriptors: *Water pollution sources, *Waste identification, *Ships, *Chemical analysis, Sampling, Testing, Oil wastes, Water pollution control, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Phenols, Organic wastes, Organic compounds, Sulfides, Bilge water, Treatment facilities, Design criteria, Waste water treatment, Slop water.

The slop and bilge waters of seven product tankers were sampled and analyzed, and their pollution characteristics were determined to provide a basis for planning shore treatment facilitis for product tanker waste waters. Product residues contaminating the waters included: regular, high test, and unleaded gasoline; heating oils; No. 5, No. 6, and low sulfur fuel oils; diesel fuel; kerosene; and aromatic naphthas and solvents. Samples were analyzed for the following parameters: total oil, chemical oxygen demand (COD), biochemical oxygen demand (BOD5), total organic carbon (TOC), total oxygen demand (TOD), suspended solids, phenols, sulfides, ammonia, and pH. Oil was the principal pollutant; COD, BOD5, and suspended solids often exceeded regulatory limits for discharge from shore stations. Occassional significant levels of phenols and sulfides were found in slop waters but rarely in bilge waters. Ammonia and pH were not significant pollutants in these waters. It is noted that if the treatment of tanker waste waters is to be combined in facilities treating fresh water waste streams, the possible harmful effects of salinity and the hydraulic and contaminant loadings must be considered. (Davison-IPA)

Descriptors: *Halogens, *Bromides, *Iodides, *Water pollution sources, *Tracers, *Groundwater, *Neutron activation analysis, *Hydraulic conductivity, Chlorine, Soil water movement, Path of pollutants, *Radioactive tracers, Deep system, Shallow soil system, Post-sampling, Hydraulic velocity.

The need for non-contaminating underground water tracers is significant. The imbalance between the natural distribution of water in space and time and the distribution man desires will grow with time. This study examines the application of three halogen water tracers - bromine, iodine, and chlorine - and offers recommendations on their acceptibility for use in various soils. The bromide ion is a most dependable, accurate tracer for monitoring tests at different well sites. In one test this ion reproduced the accuracy of tritiated water, the best recognized but radioactive and therefore 'polluting' tracer. Application results for the iodide ion as a tracer are described for water tracing of 'deep' systems and limited success for shallow soil systems are demonstrated. The chloride ion, is acceptable for water tracing in a shallow soil system Simultaneous injection of combinations of these inexpensive tracers into water systems, and subsequent detection using post-sampling neutron activation analysis allows an independent estimation of average hydraulic velocities and the calculation of hydraulic conductivities from classical hydrologic methods. DISSOLUTION POTENTIAL OF SURFICIAL MANCOS SHALE AND ALLUVIUM,
Colorado State Univ., Fort Collins.
J. B. Laronne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 464.

Price codes: A07 in paper copy, A01 in microfiche. PhD Dissertation, 1977. 128 p, 21 fig, 13 tab, 53 ref, append. OWRT B-121-COLO(1), 14-31-0001-5061.

Descriptors: *Salinity, *Colorado River Basin, *Mancos Shale, Salt source, *Salts, *Sulfates, *Dissolved solids, *Alluvium, *Sediments, Salt deposits, Water chemistry, Conductivity, *Dilution, Water quality.

The objectives were to determine the salt content of Mancos Shale and associated alluvium and the release mechanisms of salt from these deposits. When mixed with distilled water, the time necessary to approach equilibrium decreased with an increase of salt content and with a decrease of sediment concentration, and the time span required for equilibrium ranged from a few minutes to several days. The chemical quality of the aqueous mixtures was of the Ca2+-MG2+-Na1+-SO42--HCO31- type. Sodium and magnesium hydrated sulfates appeared to dissolve faster than gypsum or calcite and the relative abundance of Na1+, Mg2+ and SO42- decreased with increased dilution. There is a large inherent variability in the salt content of sampled sediments. Soluble mineral content of Mancos Shale from hillslopes (2 percent) is significantly larger than that of terrace alluvium (0.62-0.29 percent) and bed materials (0.93-0.81 percent) of North Miller and West Salt Creeks respectively. The most saline deposits (10 percent) are efflorescent bed crusts. Terrace and bed materials in narrow valleys where shallow alluvium overlies shale are highly saline (1.6 percent) and show an increase in salt content with depth. The results also show that major areas of diffuse sources of salts are also the major sediment contributors in the Upper Colorado River Basin.

IMPLEMENTATION AND EVALUATION OF THE USE OF A TRANSIENT FLOW MODEL IN ASSESSING THE IMPACT OF URBAN STORMWATER RUNOFF ON THE WATER QUALITY OF THE TENNESSEE RIVER AT KNOXVILLE,
Tennessee Univ., Knoxville.
J. L. Hamby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 462, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, March 1977. 97 p, 41 fig, 7 tab, 9 ref, 3 append. OWRT A-043-TENN(2).

Descriptors: *Urban runoff, *Storm runoff, Water quality, Model studies, Evaluation, *Tennessee, Knoxville(Tenn), *Transient flow models, Sampling, Methodology, *Tennessee River(Tenn), Flow, Runoff, *Dissolved oxygen, Conductivity, Water temperature, Coliforms, Bacteria, Monitoring, Hydrogen ion concentration, Biochemical oxygen demand.

This study was part of an ongoing research project concerned with the impact of urban stormwater runoff on the water quality of the Tennessee River at Knoxville. This study attempted to implement the use of a transient flow model for examination of water quality during runoff events. Specifically, the model was used to trace a slug of water from a point on the Tennessee River above Knoxville to a point below the city during a runoff event. A sampling methodology was developed which, when used in conjunction with the flow model, allowed graphical prediction of water quality changes in the slug of water as it moved past the city. Application of the flow model to this research provided little information into the analysis of the effects of urban stormwater runoff on the water quality of the receiving river. Specific parameters monitored include temperature, dissolved oxygen, pH, conductivity, biochemical oxygen demand and fecal coliform bacteria. For the five test runs included in this study, only one parameter, dissolved oxygen, was observed to exceed stream standards. No general trends could be determined for any of the parameters which seemed to fluctuate according to conditions specific to each rainfall-runoff event.
W79-02828

INTERACTION BETWEEN LANDFILL LEACHATES AND CARBONATE-DERIVED RESIDUAL SOILS,
Missouri Univ.-Columbia. Dept. of Geology.
D. L. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 463, Price codes: A06 in paper copy, A01 in microfiche. M. A. Thesis, August 1974. 99 p, 15 fig, 12 tab, 33 ref, 2 append. OWRT B-077-MO(2), 14-31-0001-3608.

Descriptors: *Groundwater, *Organic carbon, *Landfill leachate, *Missouri, *Landfills, Sampling, Pollutant identification, Residual soils, Carbonates, Iron, Sulfate, Hydrogen sulfide, *Percolation, Kaolinite, Absorption, Water pollution sources.

One of the major sources of organic carbon in ground water systems in Missouri is leachate from improperly located and/or improperly operated sanitary landfills. Several leachate samples were collected from eight landfill operations in Missouri and analyzed for twenty-one constituents including organic carbon, iron, sulfate, and hydrogen sulfide. The mean organic carbon content of the leachates studied was approximately 4,000 mg/l carbon. These landfill leachates are typically about 40 times more potent than septic tank or sewage treatment plant effluent in terms of their relative ability to lower the redox potential of groundwater systems. Percolation experiments were conducted to evaluate the capacity of the kaolinitic soils from central and southern Missouri to remove organic carbon from leachate. This study showed that less than 5 percent of the organic carbon is removed from the leachate by absorption or entrapment by this kind of treatment. This suggests that sanitary landfills located on residual soils in the Ozarks region of Missouri may pose a greater threat to groundwater quality than is presently suspected. (Carpenter-Missouri)

POLLUTION FORECAST IN STREAMS,
Missouri Univ.-Columbia. Dept. of Civil Engineering.
C. Hung-Darth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 440, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, July 1978. 92 p, 40 fig, 7 tab, 47 ref, 2 append. OWRT A-103-MO(1), USDI-OWRT-14-34-0001-8027.

Descriptors: Accidental spills, *Dispersion, Dispersion coefficient, Fickian models, Longitudinal dispersion, *Modified Fickian models, *Pollution forecast, River, *River pollution, Streams, Water pollution sources, *Forecasting, *Model studies, Missouri, United States, Methodology.

Pollution forecast for major rivers in the U.S. necessitates the use of a simple one-dimensional model of dispersion. The Fickian one-dimensional model does not adequately describe longitudinal dispersion in natural stream. A modified Fickian model is proposed herein which is able to describe dispersion in natural streams adequately. A procedure is suggested for using this modified Fickian model for pollution forecast in rivers such as the Missouri.
W79-02831

A PRELIMINARY INVESTIGATION OF THE PHOSPHORUS LOADING CHARACTERISTICS OF LAKE CARNEGIE, PRINCETON, NEW JERSEY,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Chemical and Biochemical Engineering.
R. B. Paterson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 418, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, August 1977, 131 p, 57 fig, 14 ref, 6 append. OWRT A-047-NJ(2), 14-34-0001-7064.

Descriptors: Lakes, Sedimentation, Chemical analysis, Plant growth, Water polluton sources, Water pollution effects, *New Jersey, *Lake Carnegie(NJ), *Path of pollutants, Nutrients, *Phosphorus, *Phosphates, Eutrophication, Algae, Oxygen.

Phosphorus transport to Lake Carnegie, Middlesex County, New Jersey, has been studied intensively. Results are consistent with the observed highly eutrophic state of the Lake. Discharges accompanying severe storm events, characterized by a lower flow exceeded only 10% of the time, account for more than half the total phosphorus burden. Point-source impacts are difficult to assess. The Stony Brook behaves relatively simply; point dischargers are a well-defined, small portion of the total load. The Millstone River behaves in a very complex fashion, as a 'natural' tertiary treatment system. Point-source loads, estimated from NPDES data, are twice as large as calculated total loads. Thus, phosphorus is removed by in-stream processes. Baseflow loads are a combination of low- and moderate-flow background and point-source discharges, with removal. Very high flow transport dominates phosphorus movement, contributing to the Lake biological state. The Stony Brook and Millstone River contribute nearly equally. Phosphorus from point sources in the Upper Millstone Basin is greatly reduced before reaching the Lake. Formal treatment to reduce phosphorus from point discharges may have marginal impact on Lake state.

A THREE-DIMENSIONAL GALERKIN FINITE ELEMENT MODEL FOR THE ANALYSIS OF CONTAMINANT TRANSPORT IN VARIABLY SATURATED POROUS MEDIA, USER'S GUIDE,
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
G. Segol.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 326, Price codes: A10 in paper copy, A01 in microfiche. Report June 1976. 210 p, 10 fig, 2 tab, 12 ref. OWRT C-5224(No 4214) (4), 14-31-0001-4214.

Descriptors: *Groundwater flow, *Mass transport, Finite element method, *Finite element analysis, Equations, *Porous media, Computer programs, *Infiltration, *Model studies, *Path of pollutants, Water pollution sources.

Solutions of the three-dimensional equations for flow and mass transport in a saturated-unsaturated porous medium are obtained by the Galerkin-finite element method. The corresponding computer code written in FORTRAN IV language is presented, as well as its two-dimensional counterpart. Usage information is provided for both models. A one-dimensional infiltration problem is used to check the procedure. The results are found in agreement with existing experimental data.

THE ACCUMULATION, TRANSLOCATION AND DEGRADATION OF BIOCIDES AT LAND WASTEWATER DISPOSAL SITES: THE FATE OF MALATHION, CARBARYL, DIAZINON, AND 2,4-D BUTOXYETHYL ESTER,
California Univ., Berkeley. Sanitary Engineering Research Lab.
D. Jenkins, S. A. Klein, M-S. Yang, R. J. Wigenet, and J. W. Biggar.
Water Research, Vol. 12, p 713-723, 1978. 5 fig, 5 tab, 3 ref.

Descriptors: *Pesticides, *Waste water disposal, *Water quality, *Translocation, *Degradation(Decomposition), Waste water treatment, Waste disposal, Public Health, Pesticide ki-

netics, Pesticide residues, 2,4-D, Diazinon, Water reuse, Irrigation water.

Waste disposal on the land has been practiced since pre-Biblical times and the capacity of the land to purify wastewater has often been demonstrated. It is, however, necessary to examine the large-scale and widespread use of land wastewater disposal in the context of current regulatory attitudes, for its effect on both the land, the water quality of adjacent or underlying waters, and for associated risks (public health or otherwise). This research addresses the specific problems of translocation and accumulation of biocides during the spray irrigation of wastewater. (EIS-Deal)
W79-02890

CHLORINATED PESTICIDES AND HEAVY METALS IN STREAMS AND LAKES OF NORTHERN MISSISSIPPI WATER,
Rust Coll., Holly Springs, MS.
T. I. Rihan, H. T. Mustafa, G. Caldwell, Jr., and L. Frazier.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 568-572, 1978. 2 fig, 2 tab, 4 ref.

Descriptors: *Lead, *Mercury, *DDT, *Pesticide residues, Aldrin, Heptachlor, Water quality, Water analysis, Water chemistry, Chlorinated hydrocarbon pesticides, Heavy metals, Gas chromatography, Physicochemical properties, Agricultural chemicals, Pesticide kinetics, Mississippi, *Lindane.

Water from several Northern Mississippi sources was analysed for; several basic characteristics (e.g. hardness, pH, etc.); water soluble heavy metal ion concentration; and organic pesticide content. The relative absence of lead and mercury and the abundance of several pesticides, especially DDT were attributed to the agricultural nature of the region. (EIS-Deal)

FATE AND EFFECTS OF CRUDE OIL SPILLED ON PERMAFROST TERRAIN. FIRST YEAR PROGRESS REPORT,
Army terrestrial Sciences Center, Hanover, NH.
C. Collins, F. Deneke, T. Jenkins, L. Johnson, and T. McFadden.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A034 140, Price codes: A02 in paper copy, A01 in microfiche. Environmental Protection Agency, Special Report 76-15, 18 p, November 1976. 14 fig, 4 tab, 3 ref.

Descriptors: *Oil, *Oil spills, *Pipelines, *Permafrost, Oil pollution, Alaska, Tundra, Frozen ground, Soil types, Chemical degradation, Organic compounds, Microbial degradation, Path of pollutants, Physicochemical properties, *Crude oil.

The long-term effects and ultimate fate of crude oil spilled on permafrost-underlain tundra is the subject of this study. The project involves two experimental oil spills of 2000 gallons each on 500-m2 test plots near Fairbanks, Alaska. A winter spill, discussed in this progress report, took place in February 1976. Another spill will take place at the peak of the growing season in the summer. This allows conditions prevailing during these climatic periods to be studied as to their effect on oil spills, and makes it possible to study the reaction of the spilled oil to these temperature extremes. Monitoring of the spill and control plots includes: oil movement, temperature regime, biological effects, microbiological changes, permafrost impact, and chemical degradation of the oil. (EIS-Deal)

ADSORPTION, MOBILITY AND DEGRADATION OF CYANAZINE AND DIURON IN SOILS,
Nebraska Univ., Lincoln. Dept. of Agronomy.
J. T. Majka.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 564, Price codes: A03 in paper copy, A01 in microfiche. MS Thesis, January 1976, 40 p, 7 fig, 5 tab, 30 ref, append. OWRT B-030-NEB(2), 14-34-0001-5087.

Descriptors: *Herbicides, *Adsorption, *Mobility, *Cyanazine, *Diuron, *Path of pollutants, *Clays, Loam, Soils, Soil types, *Adsorption, *Degradation(Decomposition).

Cyanazine and diuron movement in a Monana silty clay loam soil in the field was not detected at soil depths below 5 cm in plots receiving cumulative amounts of water totaling 20 cm over a 54-day period. In hand-packed soil columns, surface applied diuron and cyanazine penetrated to depths of 10 and 20 cm, respectively, when leached over a time period and with amounts of water similar to that used in the field. Soil thin layer chromatography and adsorption isotherms studies showed diuron to be more strongly adsorbed than cyanazine. Both compounds showed greater degradation rates at the higher temperatures when studied at 4, 20, 35 and 50C and over a 20-week period. Degradation was slowest at 5C in a Valentine loamy fine sand. Diuron appeared to breakdown most readily at 35C. Cyanazine was usually decomposed by the 10th week at 5C and the 5th week at higher temperatures.

A CHEMICAL MODEL OF HEAVY METALS IN THE GREAT SALT LAKE,
Utah Agricultural Experiment Station, Logan.
A. E. Van Luik, and J. J. Jurinak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 557, Price codes: A08 in paper copy, A01 in microfiche. Research Report 34, June 1978, 155 p, 14 tab, 8 fig, 71 ref, 2 append. OWRT A-038-UTAH(1), 14-34-0001-8047.

Descriptors: *Heavy metals, Brines, Sediments, Lead(Element), Cadmium, *Utah, *Path of pollutants, Trace elements, Model studies, Toxic metals, Water pollution sources, *Great Salt Lake(Utah), Brine-sediment exchange.

The objective was to provide quantitative information for management decisions in dealing with toxic heavy metal inflows into a salt water body. The method was to develop a model to describe the chemistry of these trace metals in highly concentrated electrolyte solutions (Great Salt Lake brine). This was accomplished by expanding an existing model based on the cluster integral expansion theory of electrolyte solution structure into a comprehensive thermodynamic model describing the equilibrium chemistry of the major and minor components of brines, including heavy metals present in trace amounts. The model receives molar ion concentrations, pH, and temperature as input data. Solution density, water content, and total solute content are computed internally to express the molar input data in terms of equivalents per kilogram of solvent, which is the internal working unit for concentration. The internal supporting routines for the otherwise completely general model restrict the applicability of this model to sodium chloride dominated brines of ionic strengths from 2 to 6 molal. Temperature compensations were included to make the model applicable to solutions from 10 to 35 degrees centigrade. Other existing models have been shown applicable to more dilute solutions. The model was applied to predict the solubility of copper, lead, cadmium and zinc in samples taken from the north arm of the Great Salt Lake.

PCBS INVOLVEMENT IN THE PULP AND PAPER INDUSTRY,
R. A. Carr, G. Y. Contos, R. L. Durfee, C. C. V. Fong, and E. G. McKay.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 017, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA 506/6-77-005, Versar Inc., Final Task Report 474-5A, 110 p, February 25, 1977.

Descriptors: *Polychlorinated biphenyls, *Pulp and paper industry, Wastes, Industrial wastes, Water pollution sources, Waste water(Pollution), Costs, Waste water treatment, Pollutants, Water pollution treatment, Pulp wastes, Effluents, Carbonless paper.

Sources, distribution, and losses of PCBs in the U.S. pulp and paper industry are discussed. The major source was recycled carbonless copy paper manufactured from 1957 to 1971, but amounts of PCBs from this source diminished rapidly after 1971. A model showing past and projected PCB contents in paper products and waste waters is presented and discussed. Costs for effluent treatment to achieve 1 ppb of PCB in industrial effluents (under worst conditions) are estimated, indicating that such treatment will increase product costs by 3-5%. (Brown-IPC)

AN APPRAISAL OF THE HYDROGEOLOGICAL PROCESSES INVOLVED IN SHALLOW SUBSURFACE RADIOACTIVE WASTE MANAGEMENT IN CANADIAN TERRAIN,
Department of Fisheries and Environment, Ottawa (Ontario). Water Resources Branch.
G. E. Grisak, and R. E. Jackson.
Scientific Series No. 84, 1978, 194 p., 54 fig., 282 ref., 28 tab.

Descriptors: *Hydrogeology, Geology, *Radioactive wastes, *Management, *Subsurface drainage, *Terrain analysis, Appraisals, Nuclear energy, Groundwater, Liquid wastes, Velocity, Hydrologic aspects, Conductivity, Canada, *Chalk River, *Bruce, *Whiteshell, *Suffield, Ontario, Manitoba, Saskatchewan.

The Hydrogeological aspects of the problem of low-level radioactive waste management are introduced with a discussion of the Canadian nuclear power program; the nature of radioactive wastes and their rates of production; and the half-lives and health affects of 'waste' radionuclides. As well, a general account is given of the present Canadian policy and procedures for licensing radioactive waste management sites. Following this introductory material, a detailed account is presented of the geohydrologic processes controlling the transport of radionuclides in gfoundwater flow systems and the attendant geochemical processes causing the retardation of the radionuclides. These geohydrologic and geochemical processes (i.e., hydrogeological processes) can be evaluated by the measurement of certain variables such as aquifer dispersivity, groundwater velocity, hydraulic conductivity, cation-exchange capacity, and total competing cations. To assess the possible importance of each variable in Canadian terrain, a comprehensive discussion of presently available (Canadian) data that have been compiled pertaining to each variable is presented. A description is then given of the hydrogeology of and the waste management experiences at radioactive waste management sites at Chalk River, Ontarion; Bruce, Ontario; Whiteshell, Manitoba; and Suffield, Alberta. Along with this description there is a brief evaluation of those geohydrologic and geochemical processes that may be of importance at these sites. (WATDOC)

CONTRIBUTION OF CHRONIC PETROLEUM INPUTS TO NARRAGANSETT BAY AND RHODE ISLAND SOUND SEDIMENTS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
E. S. Van Vleet, and J. G. Quinn.
Rhode Island University Marine Reprint No. 112. Reprinted from: Journal of the Fisheries Research Board of Canada, Vol 35, no 5, p 536-543. 1978. 2 fig, 3 tab, 29 ref. SG-04-80M01-147.

Descriptors: *Sediments, *Water pollution sources, *Municipal wastes, *Oil pollution, Estuaries, Coasts, Rhode Island, Hydrocarbons, Petroleum hydrocarbons, Narragansett Bay, Gulf of Maine, Biogenic hydrocarbons, Crude oil.

Sediment cores from Narragansett Bay and Rhode Island Sound have been analyzed for petroleum hydrocarbons and compared with a relatively unpolluted sediment core from the Gulf of Maine. The sediments were analyzed for unbound hydrocarbons, hydrocarbons bound or closely associated with humic substances, and residual hydrocarbons bound or closely associated with the clay mineral or kerogen matrix. Results indicated that in general 90-100% of the hydrocarbons were in the unbound form and could be easily extracted with organic solvents. The petroleum hydrocarbons decreased with depth at all stations. Biogenic hydrocarbons made up an increasingly greater percentage of the total with increasing depth. The hydrocarbons in the Narragansett Bay sediments and near surface Rhode Island Sound sediments strongly resembled the hydrocarbons previously reported for the Providence River and upper Narragansett Bay. These petroleum-like hydrocarbons were shown to be largely introduced to the river and bay through chronic inputs from a municipal wastewater treatment plant. These hydrocarbons then undergo sedimentation throughout the entire bay and into Rhode Island Sound. Preliminary calculations indicate that over 0.2 million t (tonne) of petroleum hydrocarbons may be transported to the marine environment annually from municipal treatment plants. (NOAA)

AN EXPOSURE SCALE FOR MARINE SHORES IN WESTERN NORWAY,
Imperial Coll. of Science and Technology, London (England). Dept. of Botany.
D. H. Dalby, E. B. Cowell, W. J. Syratt, and J. H. Crothers.
Journal of the Marine Biological Association of the United Kingdom, Vol. 58(4), 1978, p. 975-990, 2 tab., 5 fig., 33 ref.

Descriptors: *Monitoring, *Atlantic Ocean, Oil, Oil pollution, Oil spills, *Methodology, Industrial wastes, Molluscs, Waves(Water), Fjords, *Bioindicators, North Sea, Lichens, Biological communities, *Rocky shore, Exposure scale, Fensfjord area, Western Norway, Oil refineries, Nucella, Norwegian coast, Black Lichen Zone, Specie abundance curves.

A rock shore exposure scale, intended primarily for use in biological monitoring sites in the Fensfjord area, Western Norway, has been prepared. This scale is developed from an earlier scale devised for Milford Haven, Wales, making use of species abundance curves along the wave exposure gradient. Independent evidence for the validity of the scale is provided by shell shape variation in Nucella lapillus and by the height of the black lichen zone in the supralittoral fringe. The successive steps in the preparation of the scale are outlined, definitions of the exposure grades are given in tabular form for the restricted set of species analysed numerically and descriptions are provided in an extended form to provide a fuller picture for users of the scale. It is believed that the scale will prove applicable to other rocky shores around the Noth Sea. (EIS-Katz)

DISCHARGE OF SOLIDS FROM FISH PONDS,
Fish Farming Experimental Station, Stuttgart, AR.
J. E. Ellis, L. T. Dewey, and R. R. Carter.
The Progressive Fish Culturist, Vol. 40(4) 1978. p. 165-166. 1 tab., 4 ref.

Descriptors: *Aquiculture, Fish establishment, *Fish farming, Fish handling facilities, *Fish hatcheries, Fish management, Fish ponds, Biomass, Fish populations, *Animal wastes(Wildlife), Suspended solids, Waste treatment, Waste water, Sources of pollution.

Water samples were collected from effluents of fish ponds and analyzed for setteable, nonsetteable, and suspended solids. Fish biomass in ponds was not consistently associated with amounts of setteable or nonsetteable solids, but was correlated with amounts of suspended solids. The amount of solids discharged was relatively small, suggesting little or no pollution of receiving waters. (EIS-Katz)

A MEASURE OF RESPONSE TO PERTURBATION USED TO ASSESS STRUCTURAL CHANGE IN SOME POLLUTED AND UNPOLLUTED STREAM FISH COMMUNITIES,
Delaware Univ., Newark. Dept. of Biological Sciences.
H. Cornell, L. E. Hurd, and V. A. Lotrich.
Oecologia, Vol. 23, p. 335-342, 1976. 1 fig., 2 tab., 10 ref.

Descriptors: Mathematical studies, *Statistical methods, *Biological communities, Sampling, Dominant organisms, Bioindicators, Water pollution, Water pollution effects, Sedimentation, Silting, Freshwater fish, Tagging methodology, *Stream fisheries, *Diversity index, Evenness, *Index of change.

A new method for measuring structural change in sets of species which have been subjected to natural or exprimental perturbation is developed and is shown to be superior to static diversity and evenness measures for this purpose. Three parameters, are shown to provide necessary and sufficient information on the severity of a perturbation as well as the uniformity of its effect on all species in the set. When positive and negative changes in species abundance are considered separately, the method is sensitive to compensatory changes which are not detected by static measures. The parameters are then calculated for some data sets on polluted and unpolluted fish communities in second and third order streams from the Clemons Fork watershed in eastern Kentucky. Results indicate that the diversity of change over two sampling seasons is high for perturbed and unperturbed systems, but the evenness of change is lower for the communities which were polluted in the second sampling season. Several pollution results in the suppression of most major fish species, whereas more moderate pollution results in a large number of compensatory changes. The biological basis for such an outcome is discussed, and the notion of these three parameters as the 'vital signs' of a healthy ecosystem is presented. (Katz)

DETERMINATION OF THE PRACTICAL VALUE OF TOXIC LOADINGS,
British Columbia Research Council, Vancouver. Canadian Environmental Protection Service, Ottawa, Ontario K1A 1C8, Cooperative Pollution Abatement Research (CPAR) Project Report 588-1, April, 1977, 38 p. 2 fig, 6 ref, 11 tab.

Descriptors: *Pulp wastes, *Toxicity, Acid streams, Alkaline water, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Canada, Foreign countries, Effluents, Waste water(Pollution), Mixing.

The additive nature and mixing patterns of toxic loadings in alkaline and acid sewers of bleached kraft mills were investigated at two British Columbia locations (Powell River and Harmac) of MacMillan Bloedel Ltd. Results indicated that the toxicity of different process streams making up the individual acid and alkaline sewers is additive when expressed in terms of toxicity emission rates or toxic loadings per ton of pulp. On the other hand, when the acid and alkaline sewers were combined into total mill effluent, their toxicities were less than additive. The procedure by which the two streams were mixed did not have any effect on the combined effluent's toxicity. (Brown-IPC)

SUPPLEMENT TO 'EFFECTS OF THERMAL DISCHARGES ON PHYSICO-CHEMICAL PROCESSES AND WATER QUALITY' VISTULA RIVER, POLAND,
Institute of Meteorology and Water Management, Warsaw (Poland).
J. R. Dojlido.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 580, Price codes: A08 in paper copy, A01 in microfiche.

Environmental Protection Agency, Report EPA 600/3-77-074b, November, 1977. 147 p, 130 tab, 6 ref.

Descriptors: *Thermal effects, *Water temperature, On-site-investigation, Water pollution effects, Streams, Electric power, *Thermal pollution, Thermal power, Thermal powerplants, *Thermal water monitoring, Cooling water, *Particle size, Sediments, Chemical analysis, Water quality, *Vistula River, Poland, Kozienice Power Plant.

The study on the influence of thermal water discharge from the open cooling system of the Kozienice power plant on the thermal regimes and water quality of the Vistula River was carried out in the period from January 1973 to December 1975. The plant, situated at the 425th km of the Vistula River, first started in November 1972. Construction was finished in February 1975 with 1600 MWe capacity. Studies carried out downstream of the plant included: (1) expedition type of survey, the temperature and velocity distributions in chosen cross-sections of the river and in the outlet channel were done. (2) periodical type of survey. The temperature and velocity distribution in the cross-section 1000 m downstream of the discharge and in the outlet channel. (3) everyday observations of the temperature in the three cross-sections at three points in each both banks and midstream at 7 a.m., 12 noon and 6 p.m. Special investigations were performed using a Coulter Counter to determine the influence of thermal water discharge on the number and size distribution of suspended particles in Vistula water. This report contains basic data collected in these studies and a section on Precision of Analytical Methods. (EIS-Katz)

AN ASSESSMENT OF THE OCCURRENCE OF HUMAN VIRUSES IN LONG ISLAND AQUATIC SYSTEMS,
Brookhaven National Lab., Upton, NY.
J. M. Vaughn, and E. F. Landry.
Report BNL 50787 130 p., 1977. 29 fig, 45 tab, 106 ref.

Descriptors: *Viruses, *Public health, *Sewage treatment, Human pathology, Human diseases, Chlorination, Municipal wastes, Water analysis, Sewage effluents, Waste water disposal, Pollutant identification, Secondary treatment, Tertiary treatment, *Poliovirus, *Enteroviruses.

The survey involved the concentration, enumeration, and identification of human enteroviruses from selected aquatic systems on Long Island including embayments, lakes, creeks, public drinking water supplies, groundwater influenced by wastewater recharge, sanitary landfills, and stormwater recharge basins; and the effluents from secondary and tertiary sewage treatment plants. Enteroviruses were isolated from all systems studied except the public water supply wells. As expected, viruses were most often encountered in the chlorinated effluents of sewage treatment plants. On two separate occasions, wild type Poliovirus was isolated from one of these plants. (EIS-Deal)

SENSITIVITY OF MACROCYSTIS GAMETOPHYTES TO COPPER,
California Univ., Livermore. Lawrence Livermore Lab.
B. M. Smith, and F. L. Harrison.
Lawrence Livermore Laboratory, Technical Information Department, UCRL-52481, 38 p, 1978. 16 fig, 22 tab, 51 ref.

Descriptors: *Copper, *Kelps, *Toxicity, Bioassay, Growth stages, Growth rates, Plant growth, Plant physiology, Resistance, Reproduction, Biological membranes, Water chemistry, Water analysis, Chemical analysis, *Macrocystis, Gametophytes.

Gametophytes of giant kelp, Macrocystis pyrifera, were exposed to copper in a dish-culture bioassay system. Through their development into gametophytes, newly released spores were exposed continuously to various concentrations of copper to determine its effect on vegetative growth. In addition, gametophytes of different ages were exposed continuously to copper to determine the sensitivity of several developmental stages to copper and the effect of copper on the production of gametes. A one-week pulsed-exposure experiment was performed to determine the recovery period for vegetative growth. Complete inhibition of growth occurred when gametophytes were exposed continuously to copper concentrations of 500 ppb or more. Vegetative growth was inhibited significantly by continuous exposure to 50 ppb copper. (EIS-Deal)
W79-02586

THE EFFECT OF ARSENIC ON THE THERMAL TOLERANCE AND SURVIVAL OF NEWLY HATCHED MUSKELLUNGE FRY (ESOX MASQUINONGY),
State Univ. of New York at Buffalo. Dept. of Biology.
F. V. Paladino.
Master's Thesis, Department of Biology, State University of New York at Buffalo, 35 p, 1976. 11 fig, 8 tab, 37 ref.

Descriptors: *Resistance, *Water temperature, *Pikes, *Sodium arsenite, Arsenic compounds, Toxicity, Mortality, Fish physiology, Fry, Water pollution effects, Herbicides, Pesticide toxicity, Pesticide residues, Water quality, Bioassay, *Arsenic, Thermal pollution.

Newly hatched muskellunge fry were raised in tanks containing 0.00, 0.05, 1.0 and 5.0 ppm arsenic as sodium arsenite at a temperature of 15C (+ or - 0.5C) and a photoperiod of 12 hours of light alternating with 12 hours of dark. Temperature tolerance of fry, Critical Thermal Maximum, (CTM), was significantly reduced by exposure to arsenic. Fry raised at arsenic concentrations of 0.05 ppm or greater suffered 100% mortality during or shortly after swim-up. Control fry had a sharp drop in CTM during swim-up, became active feeders and continued to develop normally. (EIS-Deal)
W79-02587

DIVERSITY AS A MEASURE OF BENTHIC MACROINVERTEBRATE COMMUNITY RESPONSE TO WATER POLLUTION,
State Univ. of New York Coll. at Oneonta. Dept. of Biology.
P. J. Godfrey.
Hydrobiologia, Vol. 57, No. 2, p 111-122, 1978. 4 fig, 5 tab, 36 ref. OWRT B-004-MASS(8), 14-01-0001-1510.

Descriptors: *Bioindicators, *Stream pollution, *Benthic fauna, *Aquatic invertebrates, Water pollution effects, *Diversity indices.

The assumption that water pollution causes a depression in the diversity of benthic macroinvertebrates as measured by the Shannon index and similar diversity indices is questioned. An interpretation of the community response of benthic macroinvertebrates to pollution in the Millers River, Massachusetts is developed from species presence-absence and abundance data in conjunction with published information on the species' environmental tolerances as compared to chemical water quality data. This interpretation is compared with one derived solely from diversity index values. The interpretations are quite different; the differences may be attributed to other environmental factors such as impoundments and flow reduction which influence the fauna and thus the diversity index value, but which are not related to pollution. In addition, several intrinsic features of the diversity indices increase their bias.

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. INTERIM SYNTHESIS: BEAUFORT/CHUKCHI.
National Oceanic and Atmospheric Administration, Boulder, CO. Outer Continental Shelf Environmental Assessment Program.
NOAA/ERL/OCSEAP, Arctic Project Office, Interim Synthesis Report: Beaufort/Chukchi, August 1978. 369 p.

Descriptors: *Water pollution effects, *Resources development, *Baseline studies, *Oil pollution, *Environmental effects, Aquatic live, Arctic, Cold regions, Ice, *Outer Continental Shelf, Beaufort Sea, Chukchi Sea, Petroleum development.

Twelve baseline studies are compiled providing information on: The Sea Ice Environment; Physical Oceanography and Meteorology; Earth Sciences; Marine Mammals; Birds; Marine Biota; Chemistry and Microbiology; Species, Habitats and Processes Sensitive to OCS Development; Trophic Interactions; Probable Impacts and Consequences of Oil Development; Effects of Gravel mining and Construction of Gravel Islands and Causeways; and Environmental Hazards to Offshore Operations of the Beaufort and the Chukchi Seas before the development of petroleum and related resources were undertaken. (See W79-02609 thru W79-02613) (Sinha-OEIS)
W79-02608

SPECIES, HABITATS AND PROCESSES SENSITIVE TO OCS DEVELOPMENT,
Environmental Research Lab., Fairbank. AK. Arctic Project Office.
In: Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis Report: Beaufort/Chukchi. Part II, Interdisciplinary Aspects of Likely OCS Impacts, August 1978. p 251-267, 1 fig, 1 tab. P. Connors, (ed.).

Descriptors: *Resources development, *Water pollution effects, *Environmental effects, *Aquatic life, Habitats, Ecosystems, Baseline studies, Alaska, *Outer Continental Shelf, *Environmental assessment, Petroleum development, Beaufort Sea.

The Alaskan Beaufort seacoast is a mosaic of marine, shoreline and tundra habitats distributed over a length of several hundred kilometers. Some habitats, such as saltmarsh, are very important to wildlife and are easily damaged by OCS development, but are limited in areal extent and are dispersed in many small patches along the coast. Different sensitivity ratings are assigned to a list of habitats and the seasonal variations in sensitivity within each habitat is noted. Under the separate discussion of key biota, species are listed which merit special attention in research and management. These are chosen for a variety of reasons, including high population concentrations along the Beaufort coast, vulnerability to potential disturbances such as oil spills, scarcity in North America, or importance to humans for subsistence use. See also W79-02608. (Sinha-OEIS).
W79-02609

TROPHIC INTERACTIONS.
Environmental Research Lab., Fairbanks, AK. Arctic Project Office.
In: Environmental Assessment of the Alaskan Continental Shelf Interim Synthesis Report: Beaufort/ Chuchi. Part II, Interdisciplinary Aspects of Likely OCS Impacts, August 1978. p 268-287, 33 ref. Frost, K. (ed.).

Descriptors: *Environmental effects, *Trophic level, *Ecosystems, *Arctic, Alaska, Oil spills, Water quality control, Baseline studies, *Outer Continental Shelf, Trophic interactions, Petroleum development, Beaufort Sea.

The trophic interactions of the food web in the Beaufort Sea and the potential environmental impacts of petroleum exploration and development on this ecosystem are examined. Not only are arctic organisms different from temperate ones, but so is the behavior of oil in cold arctic waters, and in the presence of ice. Identification of key species and important species interdependencies will make it easier to develop predictive models or to assess ecological effects. Trophic studies are a means of ordering and simplifying systems, of reducing them from lists of hundreds of species of smaller sets of key species and interactions. The study of trophic interactions within a system can identify potential differential sensitivity of parts of the system, evaluate which times or places or species appear to be most or least vulnerable, and make recommendations as to how to minimize potential detrimental effects of OCS development. PROBABLE IMPACTS AND CONSEQUENCES OF OIL DEVELOPMENT,
Environmental Research Lab., Fairbanks, AK. Arctic Project Office.
In: Environmental Assessment of the Alaskan Continental Shelf Interim Synthesis Report: Beaufort/ Chukchi. Part II, Interdisciplinary Aspects of Likely OCS Impacts, August 1978. p 288-320, 36 ref. Burns, J. J. (ed.).

Descriptors: *Habitats, *Biota, *Oil spills, *Arctic, Alaska, Baseline studies, Environmental effects, Cold regions, *Outer Continental Shelf, *Environmental impact, Beaufort Sea, Petroleum development.

Two sections, one on sensitive species and habitats and another on trophic interactions, have been singled out for separate discussion. The object was to reexamine and reevaluate predictions of the possible consequences of hypothetical situations which would probably occur during development of the Beaufort Sea. This working group was concerned with attempting to recognize and discuss those species, geographical areas and habitats considered to be sensitive or critical. Thus, if a species of animal is considered sensitive, its sensitivity is to oil spills, disturbance, dislocation or other impacts generated by the processes of exploration, development or production of gas and oil fields. The animal could be adversely affected while the capability of its habitat to support that animal remains essentially unchanged. 'Sensitive areas' are considered to be those in which biological productivity is relatively high and which would probably be adversely impacted by major disturbances, particularly oil spills. Adverse impacts in a significant portion of a sensitive area would result in a 'critical impact' to one or more species of plant or animal. (See also W79-02608) (Sinha-OEIS)
W79-02611

EFFECTS OF GRAVEL MINING AND CONSTRUCTION OF GRAVEL ISLANDS AND CAUSEWAYS.
Environmental Research Lab., Fairbanks, AK. Arctic Project Office.
In: Environmental Assessment of the Alaskan Continental Shelf Interim Synthesis Report: Beaufort/ Chukchi. Part II, Interdisciplinary Aspects of Likely OCS Impacts, August 1978. p 321-334, 16 ref. Hopkins, D. M. (ed.).

Descriptors: *Resources development, *Mining, *Environmental effects, Gravels, Drilling, Exploration, Arctic, Alaska, Cold regions, Baseline studies, *Outer Continental Shelf, *Artificial islands, Beaufort Sea, Petroleum development, Environmental assessment.

With proper design and scheduling, many of the natural islands of the Beaufort Sea could be used for exploratory and developmental drilling and as production sites with low negative environmental consequences. Certain islands (western Cooper, Cross, Duck, and Howe Islands) which are important nesting habitats, should be kept untouched. Historical and archaeological sites should be inventoried and protected before use of the tundra-covered Pleistocene islands is permitted. Causeways may cause more serious perturbations of the environment. However, in spite of their disadvantages, a causeway could prove extremely useful in limiting the dispersal of oil during a major spill event. Dismantling and removal of artificial islands and causeways may create as much environmental disturbance and involve at least as much cost as the original construction. Biota may have become dependent on the causeways and artificial islands and serious consideration should be given to leaving in place those structures that do not pose serious hazards to navigation, with or without their slope protection. A few artificial islands and causeways can be constructed in appropriate places without severe adverse consequences, but the lacing of the 1979 lease area with multiple artificial islands, stabilized natural islands, and interconnecting causeways could have disastrous cumulative effects upon the biota of this arctic region. (See also W79-02608) (Sinha-OEIS)
W79-02612

ENVIRONMENTAL HAZARDS TO OFFSHORE OPERATIONS.
Environmental Research Lab., Fairbanks, AK. Arctic Project Office.
In: Environmental Assessment of the Alaskan Continental Shelf Interim Synthesis Report: Beaufort/ Chukchi. Part II, Interdisciplinary Aspects of Likely OCS Impacts, August 1978. p 335-362, 1 fig. Weeks, W.F. (ed.).

Descriptors: *Resources development, *Hazards, *Cold regions, *Offshore platforms, Environmental effects, Baseline studies, Alaska, Ice, *Outer Continental Shelf, Beaufort Sea, Petroleum development, Environmental assessment.

A number of areas have been discussed in which the environment can have a significant impact on offshore operations along the Beaufort Sea coast. If the nature of the environmental hazard is understood and incorporated into the initial design and subsequent operation of a system, safe and efficient operation can certainly be achieved although at times the price will be high. The Beaufort Sea is a frontier area in the sense that many of the environmental problems encountered there, in particular those associated with the presence of ice, are different from the problems that are usually encountered in petroleum development of an ice-free coast. There is, however, operation experience that has been gained in other areas where ice is common, such as the Canadian Arctic and Cook Inlet, and it is directly applicable to the Beaufort Sea coast. Good design for this challenging region will definitely require a thorough knowledge of environmental hazards and sea ice mechanics coupled with solid inventive engineering. (See also W79-02608) (Sinha-OEIS)
W79-02613

EFFECTS OF BUNKER C OIL AND AN OIL DISPERSANT: PART 2--EFFECTS ON THE ACCUMULATION OF CHLORINE-LABELLED BUNKER C OIL IN VARIOUS FISH TISSUES,
Simon Fraser Univ., Brunaby. (British Columbia). Dept. of Biological Sciences.
B. A. McKeown, and G. L. March.
Marine Environmental Research, Vol 1, No 2, p 119-123, October 1978. 1 fig, 9 ref.

Descriptors: *Water pollution effects, *Oil pollution, Fish, Environmental effects, Laboratory tests, *Outer Continental Shelf, *Bunker C oil, Dispersants, Hydrocarbons.

Chlorine-labelled Bunker C oil was used to measure the differential accumulation in various fish tissues between a hydrocarbon and a hydrocarbon/ oil dispersant mixture. There is an increased movement of the emulsified oil across the gill structure although accumulation by this tissue is similar for both test conditions. The liver and kidney showed significantly higher levels of the oil/dispersant mixture whereas muscle accumulations were less dramatic. The amounts of Bunker C found in the gills, liver and kidney were considerably higher than that found in the muscle. Consideration was given to the varying capability of the blood to carry polar, compared with non-polar, compounds. (Sinha-OEIS)
W79-02620

EXPERIMENTS WITH LITTORINA SPECIES TO DETERMINE THE RELEVANCY OF OIL SPILL DATA FROM SOUTHERN CALIFORNIA TO THE GULF OF ALASKA,
University of Southern California, Los Angeles. Inst. for Marine and Coastal Studies.
D. Straughan, and D. Hadley.
Marine Environmental Research, Vol 1, no 2, p 135-163, October 1978. 12 fig, 9 tab, 18 ref.

Descriptors: *Oil spills, *Toxicity, *Mortality, *Water pollution effects, Environmental effects, Alaska, Canada, California, Laboratory tests, Temperature, *Outer Continental Shelf, Littorina scutulata, Littorina sitkana, Petroleum, Gasoline.

Littorina scutulata were collected from Alaska, Canada and southern California and L. sitkana were collected from Alaska and Canada. These animals were exposed to a range of petroleums at a range of temperatures. Gasoline was the most toxic of all compounds tested. Six degrees C and 29C temperatures both during and prior to experiments had a greater influence on survival and attachment rates a week after exposure to petroleum than did the different types of petroleum. The temperature influence can be related to both zoogeographical distribution and seasonal temperatures. Data obtained in the Santa Barbara Channel can be extrapolated to the Gulf of Alaska when differences such as temperature tolerance and type of oil are considered for the same and closely related species. Attachment rates and mortality rates changed after the animals were removed from petroleum. This suggests a weakness in standard toxicity testing procedures when mortality rates are compared immediately after removal from test solutions. (Sinha - OEIS)

CULTURING AND ECOLOGY STUDIES OF THE ROTIFER POLYARTHRA VULGARIS,

Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
A. L. Bukema, J. Cairns, Jr., P. C. Edmunds, and T. H. Krakauer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 587, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA 600/3-71-051 August 1977. 53 p, 16 tab, 7 fig, 91 ref.

Descriptors: *Zooplankton, *Methodology, *Rotifers, *Laboratory tests, Laboratory equipment, Oxygen, Vitamins, Animals, Fish food organisms, Water temperature, Stress, Oxygen, Animal growth, Animal diseases, Animal physiology, Reproduction, Animal population, Chlorophyll, *Polyarthra vulgaris.

The results contained in this report represent research conducted to identify variables which affect the survival and reproduction of the rotifer, Polyarthra vulgaris. The following variables were studied: handling stress, container size, frequency of changing the culture medium, light quantity and quality, photoperiod, oxygen and vitamin requirements, fungal parasites, food preference and concentration, antibioic effects of bluegreen algae, and temperature. Temperature had an effect on population dynamics, percent of females with eggs, number of eggs per female, and sexual reproduction. Egg production rates were estimated and observations on the duration of egg development were made. This report also includes a field study of the relation between Polyarthra vulgaris and 19 selected chemical and physical parameters. (EIS-Katz)
W79-02624

DESIGN AND EVALUATION OF LABORATORY ECOLOGICAL SYSTEM STUDIES,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
C. E. Warren, and W. J. Liss.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 051, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA 600/3-77-022, December 1977, 116 p, 1 tab, 31 fig, 51 ref.

Descriptors: *Toxicity, *Bioassay, *Mathematical models, Environment, Ecology, Aquatic biology, *Aquatic populations, *Laboratory tests, Water pollution, Water pollution effects, Laboratory equipment, Microcosms, Biological systems, Laboratory ecological systems, Toxicant effects, *Theoretical analysis, Environmental toxicology, Bioassays.

Design and evaluation of laboratory ecological system studies are considered in relation to problems and objectives in environmental toxicology. Ecological systems are defined to be organismic systems together with their level-specific, co-extensive environmental systems and to occur at individual, population, and multispecies levels of biological organization. So that the basis for judgments on the relevance and adequacy of laboratory ecological system studies for solution of problems in environmental toxicology will be clear, a conceptual framework defining with abstract generalizations the nature of biological systems is presented and employed. And a graphical calculus is used to deduce isocline systems and dynamic as well as steady-state behaviors of multispecies systms, so as to illustrate the importance of empirical evaluation of the capacities, not simply the performances, of laboratory ecological systems. Within the context of apparent toxicological problems and this conceptual framework, the relevance and adequacy of laboratory ecological system studies on toxicant effects and behaviors are evaluated. ((EIS-Katz)
W79-02625

FEASIBILITY OF USING BACTERIAL STRAINS (MUTAGENESIS) TO TEST FOR ENVIRONMENTAL CARCINOGENS,
Houston Univ., TX. Dept. of Biology.
J. E. Evans.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 672, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA-600/3-78-042, 118 p, April 1978. 7 tab, 79 ref, 4 append.

Descriptors: *Toxicity, *Bacteria, *Chemical wastes, Industrial wastes, Chemicals, Organic compounds, Hazards, Animal pathology, Human pathology, Bioassay, Physicochemical properties, E. coli, Salmonella, Aromatic compounds, Dyes, Laboratory tests, Path of pollutants, Bioindicators, *Mutagens, *Carciongens.

A rapidly growing store of data is available relative to the potential mutagenicity and carcinogenicity of new products of chemical substances manufactured for commerce in recent years. Literature regarding mixtures, such as chemical wastes, however, is scarce and hard to find. A literature review was undertaken to assess feasibility of using bacteria as screening agents to detect environmental carcinogens. Mutagenicity data were included in the study because growing experimental evidence indicates that most chemical carcinogens are mutagens, and many mutagens may be carcinogens. This investigation found that bacterial mutagenesis can be used to initiate a series of studies designed to screen for potential mutagens and carcinogens in mixed chemical wastes. (EIS-Deal)

BIOLOGICAL AVAILABILITY OF POLLUTANTS TO MARINE ORGANISMS,
Center for Energy and Environment Research, Mayaguez, Puerto Rico.
J. R. Montgomery, M. Price, J. Thurston, G. L. de Castro, and L. L. Cruz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 187, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA-600/3-78-035, 145 p, March 1978. 43 fig, 4 tab, 38 ref.

Descriptors: *Trophic level, *Food webs, *Sewage sludge, *Sludge disposal, Cadmium, Chromium, Copper, Nickel, Lead, Zinc, *Heavy metals, Clams, Oysters, Snails, Sewage disposal, Path of pollutants, Public health, Absorption, *Sea urchin, Thalassia, *Sea cucumber, *Mangrove, Tissue analysis, Bioaccumulation.

This research was initiated to determine the rates of uptake, by a Thalassia testudinum ecosystem, of Cd, Cr, Cu, Ni, Pb, and Zn which were leached from sewage sludge by seawater. Organisms utilized in the study were: clam; oyster; snail; sea cucumber; uchin; turtle grass; and red mangrove. In general, the net uptake pathways followed the trophic levels in the food webs. The authors concluded that the dumping of sewage sludge in shallow, tropical marine environments could lead to high concentrations of toxic metals inorganisms used as food by man. (EIS-Deal)

AQUATIC FIELD SURVEYS AT HOLSTON ARMY AMMUNITION PLANT, KINGSPORT TENNESSEE, FINAL REPORT,
Water and Air Research, Inc., Gainesville, FL.
J. H. Sullivan, Jr., H. D. Putnam, M. A. Keirn, D. R. Swift, and B. C. Pruitt, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 627, Price codes: A12 in paper copy, A01 in microfiche. Army Research and Development Command, Contract No. DAMD-17-75-C-5049, 267 p, June 1977. 48 fig, 20 tab, 81 ref, 4 append.

Descriptors: *Chemical wastes, *Toxicity, *Periphyton, *Explosives, Aquatic life, Aquatic environment, Biomass, Aquatic algae, Effluents, Trophic levels, Eutrophication, Biological communities, Water quality, Water analysis, Nutrients, *Munitions effluents.

Overall effects of munitions effluents were most clearly observed in the periphytic community and were confined to the vicinity of the waste outfalls. Marked increases in heterotrophic biomass and reduction in autotrophic populations were noted. Species compositions shifts among the diatoms growing on artificial substrates suggested toxic manifestations from munitions related effluents. Effects on the periphyton were observed in water containing as little as 20 microg/l RDX. Direct relationship of RDX residues to biotic response in this system must be discharge, upstream waste inputs, and flow variability make it virtually impossible to closely quantify typical conditions at a given station. (EIS-Deal)

CHRONIC TOXICITY OF CHLORDANE, TRIFLURALIN, AND PENTACHLOROPHENOL TO SHEEPSHEAD MINNOWS (CYPRINODON VARIEGATUS),
EG and G, Bionomics, Pensacola, FL. Marine Research Lab.
P. R. Parrish, E. E. Dyar, J. M. Enov, and W. G. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 269, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA-600/3-78-010, 53 p, January 1978. 35 tab, 51 ref, append.

Descriptors: *Toxicity, *Mortality, *Minnows, Pesticides, Pesticide toxicity, Pesticide residues, Organic compounds, Fish physiology, Life history studies, Life cycles, Growth rates, Growth stages, Embryonic growth stage, Fecundities, Fish reproduction, Bioassays, *Toxicity testing, *Chlordane, *Trifluralin, *Pentachlorophenol.

Sheepshead minnows were exposed to three chemicals--chlordane, trifluralin, or pentachlorophenol--in flowing, natural seawater to determine acute and chronic (full life-cycle effects). Mortality of parental fish exposed to mean measured chlordane concentrations greater than or equal to 2.8 microg/l was significantly greater than that of control fish. Exposure to mean measured trifluralin in concentrations of greater than or equal to 9.6 microg/l significantly decreased growth of parental fish. Mortality of parental sheepshead minnows exposed to mean measured pentachlorophenol concentrations greater than 88 microgl was signficantly greater than mortality of control fish. Estimates of the maximum acceptable toxicant concentration of each chemical were provided. (EIS-Deal)
W79-02631

SUBSTITUTE CHEMICAL PROGRAM - INITIAL SCIENTIFIC AND MINIECONOMIC REVIEW OF METHYL PARATHION.
Environmental Protection Agency, Washington, DC. Office of Pesticide Programs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 840, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-540/1-75-005, 176 p, February 1975. 4 fig, 29 tab, 45 ref.

Descriptors: *Pesticides, *Pesticide toxicity, *Pesticide kinetics, Pesticide residues, Organic pesticides, Toxicity, Organic compounds, Path of pollutants, Chemical properties, Persistence, Cost-benefit analysis, *Methyl parathion, Substitute chemical program.

Methyl parathion was reviewed for suitability as a substitute chemical for more environmentally dangerous pesticides. The substitute chemical was analyzed in reference to its chemistry, toxicology, pharmacology, and environmental fate and movement, and socioeconomic factors such as use patterns, costs and benefits. (EIS-Deal)

PREIMPOUNDMENT STUDY LITTLE BLACK CREEK DRAINAGE BASN BLACK CREEK WATERSHED BULLOCH COUNTY, GEORGIA,
Environmental Protection Agency, Athens, GA. Surveillance and Analysis Div.
H. C. Vick, D. W. Hill, H. A. True, R. J. Brunner, III, and T. O. Bramwell, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 310, Price codes: A06 in paper copy, A01 in microfiche. Report EPA 904/9-77-026, August 1977. 74 p, 20 fig, 11 tab, 6 app, 29 ref.

Descriptors: *Water quality, Impoundments, *Preimpoundment, *Multiple-purpose reservoirs, Reservoir sites, Water analysis, Water chemistry, Nutrients, Eutrophication, Coliforms, Pathogenic bacteria, Domestic wastes, Biochemical oxygen demand, Dissolved oxygen, Watersheds(Basins), *Drainage basins, *Georgia, *Black Creek Watershed(Geo), Bulloch County(Geo).

Water quality studies were performed on this drainage basin to determine preimpoundment conditions and predict the effects of the project. It was concluded that: (1) a dissolved oxygen deficiency would be created; (2) the degree of eutrophication experienced would depend upon the control of nutrient sources; and, (3) fecal coliform levels should decrease sufficiently to allow recreational swimming. (EIS-Deal)

EFFECTS OF CHANNELIZATION OF THE LUXAPALILA RIVER ON FISH, AQUATIC INVERTEBRATES, WATER QUALITY AND FURBEARERS,
Mississippi State Univ., Mississippi State. Dept. of Wildlife and Fisheries.
D. H. Arner, H. R. Robinette, J. E. Frasier, and M. H. Gray.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 507, Price codes: A04 in paper copy, A01 in microfiche. Department of the Interior, Fish and Wildlife Service, Office of Biological Services, Report No. FWS/OBS-76-08, June 1976. 58 p, 8 fig, 27 tab, 24 ref.

Descriptors: *Channel improvement, *Channels, *Dredging, Environmental effects, Productivity, Water quality, Turbidity, Plankton, Channeling, Benthic fauna, Fish populations, Sewage effluents, Bass, Channel catfish, Channel flow, Furbearers, Beavers, *Species diversity, Muskrats.

Biological data collected from July 1973 to January 1976 from an old channelized segment (over 52 years), an unchannelized segment, and a newly channelized segment of the Luxapalila River, Mississippi, and Alabama, revealed that productivity of the old channelized segment has not recovered to the levels exhibited in the unchannelized segment. There were no evident differences in water quality between the three segments except for higher turbidity trends in the newly channelized segment. The number of plankton organisms was higher in the newly channelized segment, possibly due to influence of sewage. Diversity of plankton, macroinvertebrates, and fish was greater in the unchannelized segment than in the channelized segments. The average number/sample of fish and macroinvertebrates was significantly higher in the unchannelized segment. Muskrat and beaver, the species not commonly associated with an aquatic habitat, were far more numerous in the unchannelized segment than in either the old or newly channelized segments. (EIS-Deal)

USE OF COMMENSAL PROTOZOA AS BIOLOGICAL INDICATORS OF WATER QUALITY AND POLLUTION,
Wayne State Univ., Detroit, MI. Dept. of Biology.
G. A. Antipa.
Transactions of the American Microscopical Society, Vol 96, No 4 p 482-489, 1977. 3 fig, 22 ref. OWRT A-015-ILL(2).

Descriptors: *Bioindicators, *Indicators, *Protozoa, Infection, *Mollusks, Water pollution effects, Water quality, Endocommensal molluscan ciliated protozoa.

Commensal ciliated protozoa of fresh-water bivalve molluscs were tested for their ability to detect conditions of organic pollution within a small midwestern stream. Data are presented which demonstrate that one of these ciliates, Heterocinetopsis unionidarum, responds rapidly to unfavorable conditions. The further development of sensitive biological indicators and their potential to warn of impending and possibly irreversible environmental change are discussed.

THE EFFECTS OF THREE PHTHALATE ESTERS ON THE LARVAL DEVELOPMENT OF THE GRASS SHRIMP PALAEMONETES PUGIO (HOLTHUIS),
Texas A and M Univ., College Station. Dept. of Biology.
R. B. Lauhglin, Jr., J. M. Neff, H. R. Hrung, T. C. Goodwin, and C. S. Giam.
Water, Air, and Soil Pollution, Vol. 9, p 323-336, 1978. 4 fig, 3 tab, 32 ref.

Descriptors: *Shrimp, *Toxicity, *Growth stages, *Growth rates, *Larval growth stage, *Animal metabolism, *Bioassay, *Mortality, *Animal physiology, *Absorption, Crustaceans, Organic compounds, Water pollution effects, *Esters, Phthalate esters, *Zoeae, Palaemonetes, *Tissue.

The effects of three phthalic acid esters, dimethyl phthalate (DMP) di-n-butyl phthalate (DEP), and di-2-ethylhexyl (DEHP) on survival and development rate of larvae of the grass shrimp were investigated. Only 100 ppm DMP and 10 to 50 ppm DBP were acutely toxic to the larvae. DMP at a concentration of 100 ppm significantly increased the duration of larval development to the first postlarval stage. DEHP concentrations up to 1 ppm (the solubility limit of this ester) were without effect on either survival or development rate of the larvae. Phthalate esters were not detectable at or above the 2 ppm level in the tissues of larvae chronically exposed to phthalates for the duration of larval development, suggesting active metabolism of phthalates by this species. SEICHE STRUCTURE AND VERTICAL MIXING BELOW THE EPILIMNION IN SMALL LAKES,
Michigan Univ., Ann Arbor. Div. of Biological Sciences.
P. Kilham, J. P. Adams, and B. D. LaZerte.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 400, Price codes: A09 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, East Lansing, Project Completion Report, Jan, 1979. 198 p. 47 fig, 6 tab, 47 ref, append. OWRT A-094-MICH(1), 14-34-0001-7048.

Descriptors: *Seiche structure, *Planktonic diatoms, Internal seiche structure, Seasonal shifts, Currents, Lakes, *Michigan, *Vertical stratification, *Spatial stratification, Epilimion, Hypolimion, Eutrophication, Turbulent mixing, Cyanophyta, *Frains Lake(Mich), Asterionella formosa, Synedra filiformis, Stephanodiscus hantzschii, Water pollution effects, Water pollution control.

The internal seiche structure of Frains Lake, Michigan has several vertical modes during summer stratification. The lowest frequencies have the greatest amplitudes, down to 0.05 cycles per half-hour, with the higher frequencies becoming progressively less dominant. The fundamental vertical internal mode is imperceptible. The phase shifts with depth of the observed vertical harmonics correspond well with those predicted by a discrete approximation to the continuous density internal wave equations. In addition, seasonal shifts in frequency and phase displacement that follow the seasonal changes in the temperature profile were predicted and observed. Currents in the hypolimnion are primarily driven by internal seiches. The major conclusion is that hypolimnion region of small lakes can be turbulently mixed by currents primarily driven by internal seiches. This important observation should be of use in the prediction and management of algal blooms. Vertical nutrient flux from the hypolimnion can be a major source of nutrients that sustain meta- and epilimnetic blooms of noxious blue-green algae. In addition, turbulent mixing of the hypolimnion increases steepness of the diffusion gradients between the sediments and the bottom water and the hypolimnion and the epilimnion. As a result vertical nutrient flux will be greater in small lakes with turbulent hypolimnia.

FIELD ESTIMATES OF AQUATIC PLANT RESPIRATION AND ITS APPLICATION OF STREAM DISSOLVED OXYGEN BUDGETS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
A. J. McDonnell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 333, Price codes: A03 in paper copy, A01 in microfiche. Pennsylvaia State University Research Project Technical Completion Report, December 1978. 41 p, 9 fig, 8 tab, 41 ref. OWRT B-026-PA(1), 14-31-0001-3123.

Descriptors: *Eutrophication, Aquatic plants, *Natural streams, Plant populations, Streams, *Dissolved oxygen, *Respiration, Reaeration, Low flow, Energy dissipation, *Aquatic plant growth, *Stream oxygen budget, Oxygen consumption, Dissolved oxygen concentration, Plant communities.

Daily measurements of dissolved oxygen variations were made throughout a calendar year on three separate segments of a stream subjected to aquatic plant growth. Mass balance budgets, quantifying respective sources and sinks of dissolved oxygen for the study segments, demonstrated the validity of incorporating an aquatic plant respiration pattern which varied in direct proportion to dissolved oxygen concentration. The effects of oxygen consumption by the plant population on field estimates of reaeration, daily gross primary productivity, community respiration and maximum net primary productivity in the budgeting process are evaluated. PARASITES AND RELATED PATHOLOGY OF THE COTTONTAIL RABBIT (SYLVILAGUS FLORIDANUS) IN CENTRAL PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Veternary Science.
J. P. Wiggins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 422, Price codes: A06 in paper copy, A01 in microfiche. PhD Dissertation, November, 1977. 101 p, 2 fig, 12 tab, 118 ref. OWRT B-084-PA(4), 14-34-0001-6113.

Descriptors: *Seasonal, *Pennsylvania, *Animal pathology, *Animal parasites, Parasitism, *Cottontail rabbit, *Coccidiosis, *Helminth infection, Trapping season, Trap site, Liver, Lung, Spleen, Skeletal muscle, Body weight, Hematoloty, Red blood cell count.

Over three years, 131 cottontail rabbits were examined for parasites and associated pathology after necropsy. The numbers of oocysts and helminth ova were unaffected by sex, age, trap site, trapping season, or year. Resuls indicate that differences in coccidiosis and helminth infection determined by the number of parasite species infecting the host animal are affected by year with a possibility of seasonal influence on coccidiosis. Gastro-intestional pathology was affected by sex for stomach lining; intestinal sections were affected by age, year, and trap site. Liver, lung, spleen, skeletal muscle, and Sarcocystis leporum infection scores were also influenced by one or more of the factors considered, while pathology of adrenals, brain, heart, and kidney were unaffected. Correlations of parasite data and body weights, measurements, hematology, and blood chemistry indicated that coccidiosis affects the body size of the host; helminth infections affect the blood parameters by decreasing red blood cell counts and compensation by the host. This research verifies that parasitism by coccidia and helminths is normal in cottontails and at the present time levels do not appear to severely interfere with host health. (Sink-Penn State)

TOXICITY OF BOG WATER TO EMBRYONIC AND LARVAL ANURAN AMPHIBIANS,
The Pennsylvania State Univ., University Park.
P. A. Saber.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 434, Price codes: A03 in paper copy, A01 in microfiche. MS Thesis, August 1977. 28 p, 2 fig, 6 tab, 39 ref OWRT A-042-PA(4), 14-34-0001-6039.

Descriptors: *Amphibians, *Bogs, *Acidic water, Hydrogen ion concentration, *Toxicity, Larvae, Water pollution effects, *Anuran larvae, Embryo, Bullfrog, Clawed frog, Low pH.

A survey of the amphibians of a north temperate zone bog revealed that a number of species common in suitable locations nearby were absent from the bog. Several species of anuran larvae and embryos suffered high mortality when placed in the naturally acidic stream draining the bog. Mortality of bullfrog larvae (Rana catesbeiana) placed at a nunmber of sites along the natural pH gradient (pH 3.9-6.6) formed by this stream was significantly greater than in those placed in a clearwater control stream (pH 6.6-6.9). This lethality of stream water even at moderate pH's near 6.0 indicates that a toxic factor other than acidity may be involved. In the laboratory, mortality of clawed frog (Xenopus laevis) embryos was significantly greater in unaltered bog water (pH 4.0-4.3) than in bog water neutralized with sodium hydroxide or in charcoal filtered tap water. The latter two conditions did not show significant mortality differences. This implies that low pH is the principal source of toxicity for Xenopus. (Sink-Penn State)

EFFECTS OF TEMPERATURE ON GROWTH CONSTANTS OF SELENASTRUM CAPRICORTNUTUM,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
J. H. Reynolds, E. J. Middlebrooks, D. B Porcella, and W. J. Grenney.
Journal of Water Pollution Control Federation, Vol. 47, No. 10 p 2420-2436, October 1975. 7 fig, 10 tab, 27 ref. OWRT B-070-UTAH(7), 14-01-0001-3845.

Descriptors: Algae, *Growth, Kinetics, *Selenastrum capricornutum, *Temperature.

The alga Selenastrum capricornutum (Printz) has been specified for use in bioassays by the Environmental Protection Agency. Continuous-flow (chemostat) experiments conducted at 20 degrees, 24 degrees, 27 degrees, 28 degrees, and 33 degrees C indicated that S. capricornutum exhibits luxury uptake of ammonium-nitrogen. The luxury uptake of the organism may be described by either a first-order or a hyperbolic function. The nutrient utilization constants for both luxury uptake functions have a maximum value of 3.16 and 2.46 days, respectively, at 24 degrees C. The constants decrease as the temperature is increased or decreased from 24 degrees C. The maximum specific growth rates of the organism at 20 degrees, 24 degrees, 27 degrees, 28 degrees, and 33 degrees C are, respectively, 1.365, 1.992, 1.412, 1.390, and 1.274 days, the maximum occurring between 24 degrees and 27 degrees C. The value of the ammonium-nitrogen half-saturation constant was constant between 20 degrees and 33 degrees C, with an average value of 5.356 microg/l NH4-N

USE OF HISTOLOGIC AND HISTOCHEMICAL ASSESSMENTS IN THE PROGNOSIS OF THE EFFECTS OF AQUATIC POLLUTANTS,
Louisville Univ., KY. School of Medicine.
D E Hinton, M W Kendall, and B B Silver.
In: Biological Methods for the Assessment of Water Quality. American Society for Testing and Materials, Special Technical Publication No. 528, p 194-208, 1973. 23 fig, 30 ref. OWRT A-038-KY(4). 14-31-0001-3517

Descriptors: Water pollution effects, Fish physiology, *Channel catfish, Methylmercuric chloride, Pollutant identification, *Histology, *Histochemistry, Histopathology, Cytochemistry

Application of histologic and histochemical techniques to the determination of effects of aquatic pollutants upon fish tissues is discussed. Definition of terms and techniques associated with appropriate preparation of tissue specimens are given. Illustrations include examples from control and altered tissues. A summary of work with methyl mercuric

chloride in channel catfish illustrates the use of both techniques in assessing the prognosis of the effects of aquatic pollutants upon fish tissues. (Huffsoy-Kentucky)

THE CALIBRATION OF A PHYTOPLANKTON GROWTH MODEL USING BATCH CULTURE DATA,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
T. Lederman, C. Hornberger, and G.G. Kelly.
Water, Air and Soil Pollution, Vol 5 p 431-442, 1976. 7 tab, 31 ref.

Descriptors: *Model studies, *Eutrophication, Lakes, Digital computers, Calibration, *Phytoplankton, *Predictive model, Testing, Evaluation, Ecological changes.

The feasibility of applying nonlinear parameter estimation techniques to data from batch culture of phytoplankton is studied using simulated data. A Monod-type model for nutrient uptake and growth in phytoplankton is used for the simulation. A parameter estimation procedure is applied to these data before and after they are noise-corrupted, to obtain back-calculated values of the parameter in the model. The results indicate that nonlinear parameter estimation is well suited for analytical interpretation of batch-culture data.
W79-02878

PRODUCTIVITY OF OSPREYS IN CONNECTICUT-LONG ISLAND INCREASES AS DDE RESIDUE DECLINES,
Cornell Univ. Ithaca, NY. Section of Ecology and Systematics.
P. R. Spitzer, R. W. Risenbrough, W. Walker, II, R. Hernandez, and A. Poole.
Science, Vol. 202, p 333-335, 1978. 1 fig, 1 tab, 24 ref.

Descriptors: *DDE, *Pesticide residues, *Pesticide toxicity, *Dieldrin, *Fecundity, Animal physiology, Animal pathology, Animal metabolism, *Polychlorinated biphenyls, Mercury, Non-Game birds, Birds, Chlorinated hydrocarbon pesticides, Reproduction, Pesticide kinetics, Path of pollutants, Toxicity, Productivity, *Osprey, Tissue analysis, *Bioaccumulation.

Nesting success of ospreys breeding in the Connecticut-Long Island area has increased since 1973 and is now approaching the levels recorded prior to the 1950's. Simultaneously, DDE and dieldrin residues have declined in unhatched eggs. Levels of polychlorinated biphenyls have shown no changes over the period 1969 to 1976. The increase in productivity is attributed primarily to lower levels of DDE contamination. Detrimental effects in the past on ospreys in the Connecticut River estuary are attributable to local contamination with dieldrin. (EIS-Deal)

TOXICITY-, ACCUMULATION-, AND ELIMINATION STUDIES OF ALPHA-HEXACHLOROCYCLOHEXANE (ALPHA-HCH) WITH SALTWATER ORGANISMS OF DIFFERENT TROPHIC LEVELS,
Rijksinstituut voor de Volksgezondheid, Bilthoven (Netherlands). Lab. for Toxicology.
J. H. Canton, R. C. C. Wegman, J. A. Vulton, C. H. Verhoef, and G. J. Van Esch.
Water Research, Vol. 12, p 687-690, 1978. 4 fig, 4 tab, 8 ref.

Descriptors: *Toxicity, *Brine shrimp, Organic compounds, Path of pollutants, Trophic level, Marine algae, Crustaceans, Fish physiology, Animal metabolism, Chemical analysis, Chemical properties, Growth rates, Salinity, Bioassay, Montalities, Chlorinated hydrocarbons, Hexachlorocyclohexane, *Bioaccumulation, *Tissue analysis, *Lebistes, Guppies, Artemia, Brine shrimp, Dunaliella.

A short-term study with alpha-HCH was carried out with saltwater organisms of different trophic levels: the alga Dunaliella, the crustacean Artemia, and the fish Lebistes, acclimated to water of gradually increased salinity. Within the solubility range of alpha-HCH in saltwater, there was no influence on the growth of Dunaliella. The LC50 (4 days) for Artemia was 0.5 mg l-1. In the longterm study the LC50 (35 days) for Lebistes proved to be 0.5 mg l-1. In the accumulation studies the concentration factor was about 60-90 with Artemia and about 500 with Lebistes. Equilibrium levels were reached within 24 and 48 h respectively. In the elimination studies the alpha-HCH concentration was halved within 48-72 h in Artemia and within 10 h in Lebistes. (EIS-Deal)

LES OLIGOCHETES D'UN COURS D'EAU MONTAGNARD POLLUE: LE BIEF ROUGE (THE OLIGOCHAETES OF A POLLUTED MOUNTAIN STREAM: THE BIEF ROUGE),
Centre Technique du Genie Rural des Eaux et des Forets, Paris (France). Centre d'Hydroecologie.
M. Lafont.
Annales de Limnologie, vol. 13, no. 2, p 157-167, 1977. 3fig., 2tab., 22ref.

Descriptors: *Oligochaetes, *Waste water(Pollution), *Effluents, *Worms, Annelids, Invertebrates, Distribution patterns, Aquatic life, Benthic fauna, Bioindicators, Streams, Water quality, Environmental effects, Speciation, Succession, Population, Indicators, *Bief Rouge(France).

The effects of organic wastes on the oligochaetes of the Bief Rouge were shown by the development of 3 species that were prolific to the detriment of other oligochaetes: x I. tubifex, N. elinguis, S. heringianus (and to a certain degree, N. communis). In contrast, neither L. hoffmeisteri or L. udekemianus attained high densities. The results indicated the usefulness of oligochaetes as bioindicators of water quality. It appeared that associations of pollution-resistant species varied depending upon the type of flowing water and the level of contamination. (EIS-Klein)

UTILISATION DU PROTOZOAIRE CILIE COLPIDIUM CAMPYLUM POUR LA MESURE DE LA TOXICITE ET DE L'ACCUMULATION DES MICROPOLLUTANT: ANALYSE CRITIQUE ET APPLICATIONS (USE OF THE CILIATED PROTOZOA COLPIDIUM CAMPYLUM FOR THE MEASUREMENT OF TOXICITY AND ACCUMULATION OF MICROPOLLUTANTS: ANALYSIS AND APPLICATION),
Institut Pasteur, Lille (France). Ecotoxicologie Microbienne Inst.
D. Dive, and H. Leclerc.
Environmental Pollution, Vol. 14, p. 169-186, 1977. 9 fig, 7 tab, 13 ref. (In French with English abstract).

Descriptors: *Toxicity, *Methodology, *Protozoa, Toxicants, Research and Development, Population, Growth rates, Bioassay, Microorganisms, Invertebrates, Water quality, Mortality, Lethal limit, Analytical techniques, Waste water(Pollution), *Polychlorinated biphenyl, Arsenic compounds, Mercury, Zinc, Cadmium, Copper, Lead, Phenols, Alcohols, *Bioaccumulation, Colpidium campylum, Cyanides.

A previously described method using C. campylum for toxicity bioassays was analyzed after two year's use. Dispersion of mean start populations and detection threshold of Coulter Counter R used for counts affected accuracy and reproducibility of results. The method was used to measure the minimal toxic dose of 17 water-soluble toxic substances. The method of use for direct toxicant determination of tap and drinking water, sewage, and industrial waste waters was discussed. Among substances tested were polychlorinated biphenyls, Arsenic, Mercury, Zinc, Cadmium, Copper, Lead, Cyanide, Phenol, and Ethanol. (EIS-Klein)

ACTIONS ECOTOXICOLOGIQUES DE CERTAINS METAUX (CU-ZN-PB-CD) CHEZ LES POISSONS DULCAQUICOLES DE LA RIVIERE LOT (THE ECOTOXICOLOGICAL ACTION OF SOME METALS (CU-ZN-PB-CD) ON FRESHWATER FISH IN THE LOT RIVER,
Ecole National Superieure Agronomique de Toulouse (France). Lab. de Ichtyologie Appliquee.
R. Labat, C. Roqueplo, J. M. Ricard, P. Lim, and M. Burgat.
Annales de Limnologie, vol. 13, no. 2, p 191-207, 1977. 6 fig, 9 tab, 18 ref.

Descriptors: *Freshwater fish, *Water quality, *Metals, *Toxicity, *Copper, *Zinc, *Lead, *Cadmium, Absorption, Sampling, Fish physiology, Path of pollutants, Biological membranes, Analytical techniques, *Lot River(France), Tissue analysis, Bioaccumulation.

Contamination of 15 species of fish by the heavy metals Cu, Zn, Pb and Cd was most evident at stations downstream from pollution sources on the Lot River. The fish tissues exhibited passive accumulation of the metals related to the metal concentrations in the water. There was thought to be 3 critical thresholds of metals in the water, each one affecting different physiological processes. Metal contamination affected passive absorption through the gills and food absorption against a gradient through the gut. (EIS-Klein)

Archiv fur Fischwissenschaft, Vol. 27 (1), 1976, p 9-23. 7 fig, 42 ref.

Descriptors: *Aquiculture, *Carp, Fish establishment, Fish farming, Fish physiology, Growth rates, *Nitrates, Nitrites, Waste water treatment, Waste water disposal, Laboratory tests, Microbial degradation, Microbiology, Oxidation, Sludge, Sludge disposal, Nitrogen compounds, *Controlled denitrification, *Bacterial nitrification, Microbial denitrification.

The possibility to treat waste water in a closed warm water system (60 m3) for intensified fish culture by activated sludge without reaching toxic substrate levels for carp during a period of more than three years (July 1972-December 1975) could be shown. Despite the high concentrations of nitrate (to 1800 mg NO3/1) a continuous weight increase of fish could be gained. The inclusion of a special denitrification tank resulted a controlled reduction of the nitrate to free nitrogen, and a decrease of the nitrate concentration to 200 mg NO3/1. Due to the removal of excess sludge and the loss of water by evaporation and overspill a daily addition of about 2% fresh water was necessary.

BENZO(A)PYRENE MONOOXYGENASE INDUCTION IN MARINE FISH -MOLECULAR RESPONSE TO OIL POLLUTION,

Institut Rudjer-Boskovic, Rovinj (Yugoslavia). Lab. for Marine Molecular Biology.
B. Kurelec, S. Britaric, M. Rijavec, and W. E. G. Miller.
Marine Biology, Vol. 44, 1977, p 211-216. 1 tab, 3 fig, 24 ref.

Descriptors: *Marine fish, Monitoring, Oil, Oil pollution, *Water pollution effects, Path of pollutants, Animal metabolism, Animal biochemistry, Fish physiology, *Oil spills, Fish physiology, Benthic fauna, Laboratory tests, On-site-investigations, *Benzo(a)pyrene monoxygenase, Blenniideae, Blennius pavo, *Diesel fuel, *No. 2 fuel oil, Sardines, Northern Adriatic, Fish livers, *Molecular response.

Induction of benzo(a)pyrene monooxygenase (BPMO) activity occurred in Blennius pavo, a species with a restricted territorial range, in response of exposure to a Diesel 2 oil. A response delay of 14 days was found at a concentration of 170 ppb and of 3 days when the water was saturated with Diesel 2 oil. When induced fish were transferred to clean water, elevated BPMO x activity was maintained at a high level for at least a month. A benthic protochordate, Microcosmos sulcatus, showed no increase in BPMO activity when exposed to these concentrations even after 30 days of exposure. Field observations revealed a great variation in the BPMO activity from B. pavo caught at different sites. Fish from contaminated sites had significantly elevated levels of BPMO activity. Sardine schools caught at different sites had different, low levels of BPMO activities. However, specimens from the same school had closely similar levels of enzyme activity. Measurement of BPMO activity in the livers of non-migrant fish could serve as a useful biochemical parameter for monitoring and evaluation of acute or long-term oil pollution at a given site. (EIS-Katz)

POOLS OF NITROGEN IN A GEORGIA SALT MARSH,
Georgia Univ., Athens.
A. G. Chalmers.
PhD Dissertation, 1977. 162 p.

Descriptors: *Salt marshes, *Georgia, *Nitrogen, Wetlands, Marshes, Tidal marshes, Nitrites, Nitrates, Soil gases, Ammonia, Salinity, Marsh plants, Nitrogen cycles, Turnovers, Sludge.

Seasonal variations were studied of the standing stocks of exchangeable ammonium, nitrite, nitrate, total nitrogen, and salinity in soils and total nitrogen in plants in both the high and low marsh with respect to soil nitrogen. However, annual accumulation in aboveground biomass of Spartina alteniflora was 9.84 g N/sq m in the low marsh and 4.69 g N/sq in the high marsh, suggesting the existence of additional inputs of N or more rapid turnover of soil N in the low marsh. Based on estimates of annual flux of N to S. alterniflora and standing stock of exchangeable ammonium, turnover times of inorganic N were calculated, ranging from 6-20 days for the high marsh and 3-6 days for the low marsh. Addition of sludge to short S. alterniflora marsh resulted in higher total N concentrations in the top 5 cm of the soil, in higher NH4(+) concentrations, and increased S. alterniflora biomass. Salinities in the sludge-amended areas were higher than in unfertilized areas probably due to increased transpirations. (Steiner-Mass)

DISTRIBUTION AND ABUNDANCE OF BENTHIC ORGANISMS IN THE NEW YORK BIGHT, FIRST AND SECOND MONITORING CRUISES, NOVEMBER 1975 AND MARCH 1976,
National Oceanic and Atmospheric Administration, Boulder, CO. Marine Ecosystems Analysis Program Office.
J. Caracciolo, J. Pearce, M. Halsey, and L. Rogers.
NOAA Data Report ERL MESA-40, September 1978. 51 p, 1 fig, 9 ref, append.

Descriptors: *Benthos, *Water pollution effects, *Baseline studies, Ecosystems, Environmental effects, Monitoring, Distribution, *Outer Continental Shelf, *New York Bight.

Analyses of benthic communities have been used since 1968 to indicate impacts from contaminants on the ecosystem of the New York Bight apex. This data report is a product of the fourth phase, monitoring of selected stations in the apex, and was prepared to provide machine listed data and certain statistical calculations, diversity and equitability concerned with the distribution and abundance of benthic organisms collected at 18 monitoring stations located in the standard New York Bight MESA sampling grid. Data from these stations will yield information on changes in the Bight over time by providing more replicate samples which may be compared with earlier samples collected at the same stations. Moreover, these stations also form the basis for sampling strata 4 of the new NMFS Ocean Pulse environmental assessment program. (NOAA)

SUBLETHAL EFFECTS OF TREATED LIQUID EFFLUENT FROM A PETROLEUM REFINERY ON FRESHWATER ORGANISMS,
Sprague (J. B.) Associates Ltd., Guelph (Ontario).
J. B. Sprague, D. W. Rowe, G. F. Westlake, T. A. Heming, and I. T. Brown.
Petroleum Assoc. for Conservation of the Canadian Environment; Petroleum and Industrial Organic Chemical Div., Water Pollution Control Directorate, EPS, Fisheries and Environment Canada, Ottawa, Canada, October, 1978, 297 p., 53 ref., Addendum A, Addendum B.

Descriptors: *Liquid wastes, Oil industry, Aquatic animals, *Waste disposal, Effluents, Daphnia, Rainbow trout, Sampling, Testing, Treatment, Growth rates, Respiration, Reproduction, *Lethal limit, Application methods, Assay, *Oil pollution, Water pollution effects, *Oil wastes, *Canada, *Flagfish.

Sublethal tests used twice-weekly samples of treated liquid effluent from a petroleum refinery. The tests were conducted using rainbow trout, small tropical flagfish and Daphnia pulex as the organisms. Over two years, 71 of 94 effluent samples met federal guidelines for non-lethality to trout. Six specified physico-chemical characteristics had average values within or near federal guidelines Sublethal experiments were based on non-lethal samples of effluent. Growth of rainbow trout was severely affected at 30% concentration of effluent, and threshold for effect was judged to be close to 10%. For growth, survival, and reproduction of the small tropical flagfish, the threshold was similar, at about 9%. Trout did not show any obvious avoidance reactions up to 30% effluent. However, their general locomotor activity increased at 10% and decreased sharply at 30%. Respiratory rate of trout was not significantly changed at 50% effluent, but increased at 100%. Coughing increased linearly with concentration with a threshold of significant change between 25 and 50% effluent. Daphnia pulex were killed in two days by 76% effluent and were 2.5 times as sensitive as trout. The 'safe' concentration, which would not significantly affect reproduction of Daphnia, was estimated to be 0.52%. (WATDOC)

THE RELATIONSHIP BETWEEN NET PRIMARY PRODUCTION AND ACCUMULATION FOR A PEATLAND IN SOUTHEASTERN MANITOBA,
Manitoba Univ., Winnipeg. Dept. of Botany
R. J. Reader, and J. M. Stewart.

Ecology, Vol. 53, No. 6, p. 1024-1037, Autumn, 1972. 5 fig, 5 tab, 29 ref.

Descriptors: *Peat, *Decomposing organic matter, *Primary productivity, Litter, Wetlands, Accumulation, *Canada, *Manitoba.

Two functional attributes of an ecosystem, net primary production and subsequent dry matter accumulation, were examined in four peatland types (lagg, bog, muskeg and bog forest) located in southeastern Manitoba. A preliminary peat accumulation budget was constructed by relating the amount of litter present after a single year of decomposition to the initial litter income and annual net primary production. Annual litter 'income' in the four vegetation zones ranged from 489 gm/sq m to 1,750 gm/sq m, which represented 69% to 90% of the calculated net primary production. Decomposition losses in the following year amounted to approximately one quarter of the original income. An average annual accumulation rate of 26 gm/sq m/year to 51 gm/sq m/year was calculated from radiocarbon-dated peat cores, thus suggesting that less than 10% of the annual net primary production will remain as peat. (Stihler-Mass)

NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN THE HOLLAND MARSH, ONTARIO,
Guelph Univ. (Ontario), Dept. of Zoology.
K. H. Nicholls.
Ecological Monographs, Vol. 46, No. 2, p. 179-199, Spring, 1976. 13 fig, 3 tab, 100 ref.

Descriptors: *Marshes, *Phytoplankton, *Nutrients, Biomass, Chlorophyll, Nitrogen, Phosphorus, Diatoms, Fresh water marshes, Wetlands, *Canada, Holland Marsh(Ont).

Over a year, Chlorophyceae comprised one-half, Bacillriophyceae about one-third, and Cyanophyceae less than one-tenth of the standing crop of phytoplankton in the Holland Marsh, Ontario. Diatoms were dominant in the spring and in the fall when the total phytoplankton biomass was as high as 32,000,000 cubic micrometers per ml. Chlorococcalean forms dominated in summer. Winter phytoplankton showed more diversity with a considerably lower biomass of 160,000 to 2,900,000 cubic micrometer per ml. Maximumchlorophyll a concentrations of 358 micrograms per liter compare with data from highly eutrophic waters. Chlorophyll a content of the phytoplankton ranged from 0.14$ to 1.65% of fresh weight with the value in November exceeding the May value by almost three times. Chlorophyll a contents were lowest in summer, intermediate in spring, and highest in winter when supplies of inorganic nitrogen were ample and daily incident radiation was lowest. Inorganic nitrogen most likely limited summer phytoplankton growth. The initial effects of improved nutrient retention within intensively cultivated and urban areas on the Holland River watershed is suggested as a cause of the shift in the limiting nutrient for the spring bloom from silicon dioxide to phosphorus. (Howard-Mass)

OSMOTIC BALANCE AND RESPIRATION IN THE HERMIT CRAB, PAGURUS BERNHARDUS, EXPOSED TO FLUCTUATING SALINITIES,
Natural Environment Research Council, Bangor (Wales). Marine Invertebrate Zoology Unit.
S. E. Shumway.
Journal of the Marine Biological Association of the United Kingdom, Vol. 58(4), 1978. p 869-876, 1 tab, 5 fig, 11 ref.

Descriptors: *Salinity, *Animal behaviour, Animal metabolism, *Animal physiology, Environmental gradient, *Crustacea, Crabs, Hermit crabs, Pagurus bernhardus, Oxygen, *Oxygen requirements, Laboratory tests, Laboratory equipment, Methodology, *Fluctuating, Salinities, Statistical methods.

Specimens of Pagurus bernhardus (with and without shells) were exposed to both gradual (sinusoidal) and abrupt (square-wave) salinity fluctuations and changes in haemolyph osmolality, tissue water content and oxygen consumption monitored. Oxygen consumption was also monitored under steady-state conditions; under these conditions there was no significant difference between the rate of oxygen consumption by animals with shells and animals without shells. During exposure to fluctuating salinities the crabs with shells were seen to increase locomotory activity when the external medium declined to approximately 75% sea water. Haemolymph osmolality values followed the same pattern of change as the external medium; the haemolymph of crabs without shells became significantly more dilute during exposure to low salinity than did that of crabs with shells. Crabs with shells showed a marked temporary increase in oxygen consumption when the external medium declined to approximately 75% sea water; crabs without shells showed no such response. The importance of the shell as a means of protection against dilute media is discussed. (EIS-Katz)

Investigacion Pesquera Vol. 42(1), 1978, p 65-80. 2 tab, 1 fig, 10 ref.

Descriptors: Metals, *Mercury, *Methylmercury, *Marine fish, Commercial fish, *Public health, Water pollution effects, Path of pollutants, Accumulation, *Bioaccumulation, Fish diseases, Fish physiology, Anima pathology, Mullets, Bioassay, Histology, Histopathology, DSea water, Laboratory tests.

Accumulation and histopathological effects of organic and inorganic mercury to the lisa, Mugil auratus. Mercury inorganic (HgCl2) and organic mercury (CH3HgCl) uptake by Lisa, Mugil auratus, exposed to 0.1 ppm of Hg(HgCl2) in sea water for 10, 24, 35, 46 and 57 days and 0.008 ppm of Hg (Ch3HgCl) in sea water for 15, 30 and 45 days is studied. Accumulation of mercury in flesh, blood, liver, kidney, spleen, intestine, piloric caeca and gills is determined. The histopathological aspects of this study were undertaken in the hope for a better knowledge of the effects of the mercury inorganic (HgCl2) on the liver and the intestine and the mercury organic (CH3HgCl) on the gills, stomach (muscular), liver, kidney, and intestine. FACTORS CONTROLLING THE AVAILABILITY OF SEDIMENT-BOUND LEAD TO THE ESTUARINE BIVALVE SCROBICULARIA PLANA,
Geological Survey, Menlo Park, CA.
S. N. Luoma, and G. W. Bryan.
Journal of the Marine Biological Assoc. of the United Kingdom, Vol. 58(4) 1978, p 793-802, 2 tab, 4 fig, 9 ref.

Descriptors: Metals, *Lead, Water pollution effects, Sediment, *Iron, *Lead/Iron Ratio, *Molluscs, Animal physiology, *Path of pollutants, Chemical analysis, Clams, Methodology, Estuaries, Biological availability, Southern England Estuaries, Western England, Northwest France, Tissue concentration, Sediments.

Concentrations of lead in the soft tissues of the deposit-feeding bivalve Scrobicularia plana have been compared with the phyiochemical characteristics of sediments of 20 estuaries in southern and western England and one in north-west France. The results indicate that the biological availability of lead in the sediment is controlled mainly by the concentration of iron, and that the concentration of lead in the bivalve may be predicted from the Pb/Fe ratio in 1 N hydrochloric acid extracts of surface sediments. (EIS-Katz)

INVESTIGATION OF A NUTRIENT-GROWTH MODEL USING A CONTINUOUS CULTURE OF NATURAL PHYTOPLANKTON,
University of Strathclyde, Glasgow (Scotland). Dept. of Applied Microbiology.
K. J. Jones, P. Tett, A. C. Wallis, and B. J. B Wood.
Journal of the Marine Biological Association of the United Kingdom, Vol. 58(4) 1978, p. 923-942, 5 tab., 9 fig., 23 ref.

Descriptors: *Phytoplankton, Laboratory tests, *Methodology, *Mathematical models, Biological community, *Nutrients, Phosphorous compound, Algae, Primary production, Nitrogen compounds, Growth chambers, *Growth rates, Chlorophyll, Laboratory equipment.

Phytoplankton from Loch Craran, Argyll was maintained in continous culture for 41 days. During most of this time the mixture ofj species retained the diversity and dominance pattern typical of summer phytoplankton in the loch, notwithstanding the manipulation of algal nutrient status to brong about phosphorus control of growth. Results suggest that most detritus was washed out early in the experiment. 'Quasi-steady states' with respect to concentration of chlorophyll, particulate carbon (PC), particulate phosphous (PP) and particulate nitrogen (PN), were observed at two levels of input of dissolved inorganic phosphorus. At other times the algal phosphorus quota (estimated from the ratio of PP to PC) varied from about 0.002 to 0.015 atoms P per atom C. Specific growth rate was estimated from the rate of increase of PC. During part of the experiment, growth rate was linearly related to reciprocal phosphorus quota, thus confirming the applicability of the model. (EIS-Katz)

SEASONAL PHYTOPLANKTON PRODUCTION IN THE WESTERN ENGLISH CHANNEL 1964-1974,

Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
G. T. Boalch, D. S. Harbour, and E. I. Butler.
Journal of the Marine Biological Association of the United Kingdom, Vol. 58(4), 1978, p 943-954, 5 fig., 23 ref.

Descriptors: *Phytoplankton, Marine algae, *Primary productivity, Atlantic Ocean, Carbon radioisotopes, *Methodology, Seasonal, On-site investigation, Carbon cycle diatoms, Dinoflagellates, *English Channel, 14C, Mean seasonal production, *Phytoplankton production, Laboratory equipment, Carbon fixation rates.

Over a period of 10 years, 1964-74, primary production has been measured at three stations across the western English channel using the 14C method. Results for carbon fixation, cell counts and mean seasonal production are illustrated. Statistical analyses show that, at two of the three stations, carbon fixation in 1966 was significantly greater than expected and that annual production differs significantly at each of the stations. The variations observed are discussed in relation to other changes recorded in the area during the same period. A deck incubator used for simulated in situ 14C experiments is illustrated. (EIS-Katz)

EFFECTS OF TEMPERATURE ON HATCHING SUCCESS AND SURVIVAL OF LARVAE IN THE WHITE BASS,
Environmental Research Lab., Duluth, MN.
J. H. McCormick.
The Progressive Fish Culturist, Vol. 40(4), Oct. 1978, p. 133-137, 2 tab., 26 ref.

Descriptors: *Water temperature, Freshwater fish, Bioassay, Laboratory tests, Fish eggs, Fish farming, Aquiculture, *White bass, *Juvenile fish, *Fish reproduction, *Mortality, Water pollution effects, Thermal pollution, Thermal stress, Hatching success, Larval survival, Morone chrysops.

Temperature effects on the hatching success of eggs of the white bass (Morone chrysops) were determined by exposing sample lots of recently fertilized eggs to 10 constant temperatures, 6 through 30C. Different lots of eggs were exposed to test temperatures before gastrulation, and after closure of the blastopore in the embryo. The percentages of normal larvae hatched were not significantly ($P > 0.05$) impaired in eggs exposed before gastrulation at temperatures from 18 through 26C, nor in those first exposed after closure of the blastopore at temperatures from 14 through 26C. Eggs incubated at 14C hatched 4.5 days after fertilization, and those incubated at 26C required only 1 day. The 24 h TL50 for white bass larvae exposed within 24 h of hatching and acclimated to 14, 18, 20, and 26C was between 30 and 32C, and was not altered by the acclimation temperatures tested. (EIS-Katz)
W79-02965

THERMAL RESISTANCE OF RAINBOW TROUT FROM A PERMANENTLY HEATED STREAM, AND OF TWO HATCHERY STRAINS,
Montana State Univ., Bozeman. Dept. of Biology.
C. M. Kaya.
The Progressive Fish Culturist, Vol. 40(4), Oct. 1978, p. 138-142, 2 tab., 2 fig., 17 ref.

Resistance times to high temperatures were determined for fingerling and juvenile rainbow trout (Salmo gairdneri) from the Firehole River, Yellowstone National Park, and from the Ennis and Winthrop hatchery strains, after acclimation to 5, 9, 13, 17, 21, and 24.5C. Firehole and hatchery trout acclimated to 21 and 24.5C had similar median resistance times and upper incipient lethal temperatures. After acclimation to the lower temperatures of 5, 9, 13, and 17C. Firehole trout had nonger median resistance times and slightly higher upper incipient lethal temperatures than did the hatchery trout. The ultimate upper incipient lethal temperature for the Firehole trout and for both hatchery strains was about 26.2C. Rainbow trout inhabiting and reproducing in the heated waters of the lower Firehole River do not appear to have developed the ability to acclimate to higher temperatures. (EIS-Katz)
W79-02966

ACCELERATED RATE OF ALBINISM IN CHANNEL CATFISH EXPOSED TO METALS,
Thomas Hunt Morgan School of Biological Sciences, Lexington, KY.
A. G. Westerman, and W. J. Birge.
The Progressive Fish Culturist, Vol. 40(4) Oct., 1978. p. 143-146, 2 tab., 19 ref.

Descriptors: Metals, *Arsenic compounds, *Cadmium, *Copper, *Mercury, *Selenium, *Zinc, Fish physiology, Fish disease, Channel catfish, Bioassays, Fish eggs, Aquiculture, Water supply, Fish hatchery, Water pollution effects, Fish pathology, *Albinism, Albinos, Mutagens.

Heavy metals (As, Cd, Cu, Hg, Se, Zn) were shown to increase the incidence of albinism during 5 years of experiments with channel catfish (Ictalurus punctatus). Metal-induced albinism resulted from exposure of both adult fish and eggs. In egg bioassays, exposed populations consistently exhibited higher percentages (up to 6.3%) of albinos than did controls, but frequencies did not vary significantly for the six metals or for exposure concentrations which ranged from 0.5 to 250 ug/1. Metal contamination in a hatchery water supply yielded frequencies of albinos corresponding directly with those observed for metal-exposed laboratory populations. Inasmuch as albinism has proved deleterious to fish survival and production, caution is recommended in using metallic compounds in hatchery management. Tests for albinism may prove useful in screening aquatic contaminants for mutagenic potential. (EIS-Katz)

PHYSIOLOGICAL EFFECTS OF ELECTRO-FISHING ON LARGEMOUTH BASS,
Northwestern State Univ. of Louisiana, Natchitoches. Dept. of Biological Sciences.
T. A. Burns, and K. Lantz.

Descriptors: *Methodology, *Largemouth bass, Fishing, Fishing gear, Fish physiology, Sampling, Fish biochemistry, Fish blood, Fish tissues, Stress, *Electric shocking gear, Electric current, *Electro-fishing, Micropterus salmoides.

Blood and tissue samples of adult largemouth bass (Micropterus salmoides) were taken from control fish and from fish that were electroshocked and allowed recovery times of 0,1,3,5.5, and 10 h. Shocking had no significant effect ($P > 0.005$) on hemoglobin, hematocrit, plasma protein, or percentage water content of tissue. No sexual differences in these factors were noted. Blood lactate increased significantly ($P > 0.01$) 1 h after electroshocking, returned to pre-shocked levels within a 3 h period, and then continued to decline. (EIS-Katz)
W79-02968

LETHALITY OF ELECTROSHOCK TO TWO FRESHWATER FISHES,
Wyoming Game and Fish Dept., Casper.
R. A. Whaley.
The Progressive Fish Culturist, Vol. 40(4), Oct., 1978. p. 161-163.

Descriptors: Freshwater fish, Bioassay, *Mortality, *Lethal limit, *Electric shocking, Electric current, *Electro fishing, *Electric fishing gear, Stress fishing, Fantail darter, Sunfish, Bluegill sunfish, Lepomis macrochirus, Etheostoma flavellare, Pulse frequency.

The lethality of electroshock to fish was examined by subjecting fantail darters (Etheostoma flabellare) and bluegills (Lepomis macrochiru) to levels and patterns of pulsating direct current electricity within the ranges commonly employed in the collection of fish in the field. Mortality of fish exposed to pulsating direct current increased with increased pulse frequency and exposure time. However, mortalities were negligible among fish exposed for 15 s or less, regardless of the electrical characteristics. (EIS-Katz)
W79-02969

TOXICITY OF SELECTED CHEMICALS TO THE FAIRY SHRIMP, STREPTOCEPHALUS SEALI, UNDER LABORATORY AND FIELD CONDITIONS,
Alabama Dept. of Conservation and Natural Resources, Montgomery. Game and Fish Div.
J. L. Moss.
The Progressive Fish Culturist, Vol. 40(4) Oct., 1978, p. 158-160, 2 tab., 12 ref.

Descriptors: *Toxicity, *Shrimp, Crustaceans, *Bioassay, Laboratory tests, Insecticides, Pesticides, *Chlorinated hydrocarbon pesticides, Mortality, Fairy shrimp, *Formalin, *Benzene hexachloride, *Diquat, *Paraquat, *Dylox, *Potassium permanganate, Streptocephalus seali.

Laboratory toxicity tests were conducted with six chemicals to determine their effect on fairy shrimp (Streptocephalus seali). Formalin (15 and 25 mg/1) and Diquat (0.25 to 2.0 mg/1) were not toxic to fairy shrimp. Paraquat (0.25 to 2.0 mg/1) and benzene hexachloride (0.10 and 0.25 mg/1) were moderately toxic. Cylox (0.10 and 0.25 mg/1) was highly toxic; mortality exceded 82% at 48 h. Potassium permanganate (0.5 to 4.0 mg/1) produced 100% mortality in less than 24 h. Pond treatments with potassium permanganate (1.0 and 2.0 mg/1) produced more rapid mortality than did Dylox (0.25 mg/1). Neither chemical completely eliminated all fairy shrimp from ponds, except in isolated cases. (EIS-Katz)
W79-02971

AN IMPROVED EXPERIMENTAL MEDIUM FOR FRESHWATER TOXICITY STUDIES USING DAPHNIA MAGNA,
Polytechnie of the South Bank London (England). Dept. of Applied Biology.
M. P. Tevlin.
Water Research, Vol. 12, p 1017-1024, 1978. 4 tab, 6 fig, 29 ref.

Descriptors: Metals, *Cadmium, *Iron, *Methodology, *Daphnia, Chlorella, *Bioassay, Laboratory tests, Toxicity, Water pollution effects, Laboratory equipment, Zooplankton, Phytoplankton, Freshwater, Hydrogen ion concentrations.

A medium suitable for Daphnia culture with the green alga, Chlorella sp. was chosen from the literature to investigate physiological responses by Daphnia to sublethal cadmium poisoning. Like most synthetic media this included the labile Fe-EDTA complex as a source of soluble iron which is shown to be essential for growth of both Daphnia and Chlorella. Synthesis of a ferri-gluconate complex as an alternative source of soluble iron is described; this complex being theoretically more iron-specific than Fe-EDTA, whilst providing equally well for Chlorella growth and Daphnia growth and fecundity. TES buffer (pKa 7.5) and HEPES buffer (pKa 7.55) were used at various concentrations, and 0.001M HEPES is shown to restrict pH variation to within 0.5 pH units over 10 days without adversely affecting Chlorella growth or Daphnia growth and fecundity. A bioassay of the reduction in 48 h acute toxicity of cadmium to Daphnia in media containing each potential chelating agent in turn is used. These data indicate that 0.001M HEPES buffer does not complex cadmium at 0.1 ppm, and that ferri-gluconate is less likely to do so than ferri-EDTA. (EIS-Katz)
W79-02972

ACUTE TOXICITY OF MERCURY AND SELENIUM TO CRASSOSTREA GIGAS EMBRYOS AND CANCER MAGISTER LARVAE.
Moss Landing Marine Labs., CA.
N. Glickstein.
Marine Biology, Vol. 49: 1978. p 113-117, 3 tab, 1 fig, 23 ref.

Descriptors: *Metals, Toxicity, Bioassay, Laboratory tests, Mortality, Oysters, Crabs, Molluscs, Crustaceans, *Mercury, *Selenium, *Antagonism, *Additive toxicity, Statistical analysis, Juvenile stages, Sea water.

The possible modification of mercury toxicity by selenium in embryos of the Pacific oyster Crassostrea gigas and the larvae of the crab Cancer magister was investigated. Mercury concentration eliciting abnormal development in 50% of the oyster embryos (EC50) was 5.7 micrograms/liter -1 (48 h) and mortality in 50% of the crab larvae (LC50) occurred with 6.6 micrograms/1 -1 (96 h). The 48 h EC50 for selenium was greater than 10,000 micrograms/1 -1 for oyster embryos and the 96 h LC50 for crab zoeae was 1040 micrograms/1 -1. The response from each species, when exposed to both toxicants, revealed that a high level of selenium (> or equal to 5,000 micrograms/1 -1) increased mercury toxicity. Moderate selenium concentrations (10 to 1,000 micrograms/1 -1) tended to decrease mercury toxicity, although no statistical verification could be made. The order of administration of toxicants had no effect on the response of Crassostrea gigas embryos. Early developmental stages (< of equal to 8 h) of C. gigas embryos were most sensitive to dissolved Hg; toxicant administration 24 h after fertilization resulted in no apparent abnormalities in development. (EIS-Katz)

INTERACTIONS OF METHYLMERCURY, CADMIUM, AND SALINITY ON REGENERATION IN THE FIDDLER CRABS UCA PUGILATOR, U. PUGNAX AND U. MINAX,
Rutgers - The State Univ., Newark, NJ. Dept. of Zoology and Physiology.
J. S. Weis.
Marine Biology, Vol. 49, 1978. p 119-124, 3 fig, 24 ref.

Descriptors: *Methylmercury, *Cadmium, *Salinity, Crabs, Fiddler crabs, *Bioassay, Laboratory tests, Animal physiology, Animal behavior, Additive toxicity, Metals, Water pollution effects, Methodology, Calcium, Antagonism.

After multiple autotomy in the fiddler crabs Uca pugilator, U. pugnax and U. minax, both methylmercury and cadmium retard limb regeneration and ecdysis. When crabs in sea water are exposed to a mixture of both metals, the effect is increased, indicating that the two are interacting in an additive way. In 50% sea water (=15% S), the effects of cadmium are greatly intensified so that growth of limb buds is extremely slow, if it occurs at all. When methlymecury is present in the water at the same time, the severe effects of cadmium are somewhat ameliorated, indicating an antagonistic interaction of the two metals under these conditions. Adding additional calcium to the 50% sea water also decreased the severity of the cadmium effect, thus supporting the idea of a calcium-cadmium competition. (EIS-Katz)
W79-02974

NUTRIENT REGENERATION BY ZOOPLANKTON DURING A RED TIDE OFF PERU, WITH NOTES ON BIOMASS AND SPECIES COMPOSITION OF ZOOPLANKTON,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
S. L. Smith.
Marine Biology, 49, p 125-132 (1978) 4 tab, 5 fig, 19 ref.

Descriptors: *Nutrients, *Zooplankton, *Phytoplankton, *Red Tide, Dinoflagellates, Gymnodinium, Chlorophyll, Peru, Biomass, *Primary productivity, Copepods, Crustacean, Nitrogen compounds, Nitrogen cycle, Salinity, Water temperature.

During March and April 1976, a red tide, dominated by the dinoflagellate Gymnodinium splendens Lebour, developed off Peru. At the height of the bloom, the euphotic zone was 6 m deep and the chlorophyll a at the surface was 48 micrograms/l -1. A daily collection of zooplankton at 09.00 hrs showed large fluctuations of biomass, from 0.2 to 3.84 g dry weight m-2 in a water column of 120 m. Copepodids and nauplii dominated the collections. During a period of reduced wind, the adult copepods were a mixture of the species characteristic of the coastal upwelling system and the neritic species associated with more northerly, tropical waters. Nitrogen regeneration by the zooplankton varied with the development of the bloom, the type of zooplankton dominating the experiment, and biomass fluctuations, but never accounted for more than 25% of the nitrogen uptake by phytoplankton. (EIS-Katz)

SELENIUM METABOLISM IN THE MARINE PHYTOPLANKTERS TETRASELMIS TETRATHELE AND DUNALIELLA MINUTA,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
J. J. Wrench.
Marine Biology, Vol. 49, p 231-236, 1978. 2 tab, 3 fig, 15 ref.

Descriptors: Phytoplankton, Marine phytoplankton, *Selenium, *Plant physiology, Plant biochemistry, Plant metabolism, Radioactivity, *Radio active selenium, Radioisotopes, Radioactivity techniques, Water pollution effects, Path of pollutants, *Food chains.

Radioactive selenite-75 has been used to investigate the metabolic transformation of inorganic selenium by the marine phytoplankters Tetraselmis tetrathele and Dunaliella minuta. The majority of radioselenium taken up from culture media during growth becomes associated with cellular protein. A small quantity of this protein-bound selenium can be volatilised by treatment with strong acid, suggesting the presence of hydrogen selenide. However, the principal fraction of selenium appears to be integrated into the primary protein structure. Enzymic hydrolysis of phytoplankton protein and subsequent chromatography of hydrolysates revealed the presence of seleno-analogues of the sulphur amino acids. Selenium amino acids were also detected in non-protein extracts. (EIS-Katz)

PHYTOPLANKTON AND COOLING SYSTEMS: TEMPERATURE EFFECTS USING DIFFERENT INTAKE AND DISCHARGE DEPTHS,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chalk River Nuclear Labs.
J. W. McMahon, and A. E. Docherty.
Water Research, Vol. 12, 1978, p 925-929, 1 tab, 2 fig, 17 ref.

Descriptors: *Phytoplankton, *Water temperature, Water pollution effects, Plant pathology, Plant physiology, Plant populations, Power plants, *Thermal pollution, Thermal power, *Thermal power plants, Thermal stratification, Thermal water, Water circulation, Waste treatments, On-site investigations, Lakes, *Phytoplankton species succession, Dissolved oxygen, Diatoms.

The effect of depth of intake and controlled discharge of heated waters (T-10 degrees C) on a natural phytoplankton community in a cold water lake was studied using polyethylene enclosures. Changes in plankton species composition and cell concentrations were used as indicators of temperature effects. Of three intake-discharge arrangements studied (surface intake-surface discharge; deep intake-deep discharge; deep intake-surface discharge) only the first design produced statistically significant increases in plankton numbers. A deep intake-surface discharge resulted in the least biological and physical changes in the lake water. Phytoplankton species succession in the heated water was similar to patterns observed in the open lake. (EIS-Katz)
W79-02980

EFFECTS OF SALINITY ON SYNTHESIS OF DNA, ACIDIC POLYSACCHARIDE, AND GROWTH IN THE BLUE-GREEN ALGA, GOMPHOSPHAERIA APONINA,
University of Southern Florida, Tampa. Dept. of Chemistry.
D. F. Martin, and M. H. Gonzalez.
Water Research, Vol. 12, 1978. p 951-955. 1 tab, 2 fig, 29 ref.

Descriptors: *Algae, Plant physiology, Plant nutrition, Plant biochemistry, Enzymes, *Salinity, Water quality, Sea water, Artificial sea water, Laboratory tests, Growth rates, *DNA, Carbohydrates, *Polysaccharide synthesis, Gomphosphaeria, Growth rates, *Cyanophata.

A blue-green alga, Gomphosphaeria aponina, was grown in artificial sea water at salinities 20-36%. Fair to good growth was obtained at al salinities, and growth constants (Ke) were obtained. A parabolic relationship was obtained for the growth salinity relationship, e.g. (S-Smax)2 = -2p(Ke-K'e), where S and Smax is the given salinity and the maximum salinity, respectively, for which growth constants Ke and K'e were obtained; P is a constant. The rate of DNA synthesis increased linearly with growth constant above Ke = 0.95 day-1. Linear correlation coefficients were obtained for rate of polysaccharide synthesis and the rate of DNA synthesis, as well as for the rate of DNA synthesis and the rate of synthesis of aponin. The latter is material isolated from G. aponina and has cytolytic activity toward the Florida red tide organism, Gymnodinium breve, an unarmoured dinoflagellate. (EIS-Katz)

BIOACCUMULATION POTENTIAL OF POLYCYCLIC AROMATIC HYDROCARBONS IN DAPHNIA PULEX,
Oak Ridge National Lab., TN.
G. R. Southworth, J. J. Beauchamp, and P. K. Schmieder.
Water Research, Vol. 12, 1978, p 973-977. 2 tab. 2 fig., 15 ref.

Descriptors: Absorption, Daphnia, Crustaceans, Zooplankton, Oil, Oil spills, Water pollution effects, Path of pollutants, Bioassay, Laboratory tests, Methodology, *Polyaromatic, Aromatic hydrocarbons, *Naphthalene, *Anthracene, *Phenanthrene, *Pyrene, *9-methylanthracene, *Benz(a)anthracene, *Perylene, *Bioaccumulation, Bioaccumulation kinetics, Animal physiology, Model studies.

The bioaccumulation potentials by aquatic biota from aqueous solution were determined for seven polycyclic aromatic hydrocarbons (PAH). The PAH were tested using Daphnia pulex and consisted of the following compounds: naphthalene, anthracene, phenanthrene, pyrene, 9-methylanthracene, benz(a)anthracene and perylene. Bioaccumulation kinetics were described as a first order approach to equilibrium in a two-compartment model (water and Daphnia), using a two-stage technique to estimate uptake and elimination rates, while accounting for decreasing aqueous concentrations. Estimates of equilibrium concentration factors were obatined by two methods: (1) evaluating the kinetic model as t tends to infinity and (2) direct measurement of concentration factor at t = 24h. Estimations of equilibrium concentration factors obtaned by the two methods we in good agreement, and increased dramatically with increasing molcular weight within the series of compounds. The calculated n-octanol-water partition coefficient was shown to be a good predictor of bioaccumulation potential of PAH in Daphnia. PAH were concentrated from a high of about 10,000-fold for benz(a)anthracene to a low of about 100-fold for naphthalene. (EIS-Katz)

THE PRESENCE OF POLLUTANT HYDROCARBONS IN ESTUARINE EPIPELIC DIATOM POPULATIONS,
Bristol Univ. (England). School of Chemistry.
S. Thompson, and G. Eglinton.
Estuarine and Coastal Marine Science, vol. 4, p. 417-425, 1976. 3 fig., 2 tab., 18 ref.

Descriptors: *Organic compounds, Analytical techniques, *Solvent extractions, *Estuaries, Sediments, Laboratory tests, Metabolism, Path of pollutants, *Diatoms, Absorption, Animal physiology, Environmental effects, Chromatography, Mass spectrometry, Biochemistry, *Oil pollution, *Oil spills, Pollutant identification, Bioaccumulation, Gyrosiqma sp., Nitzchia sp., Nereis sp., Epipelic diatoms, *Seven Estuary(England).

The presence of a complex mixture of aliphatic hydrocarbons in the organic extracts of 3 populations of estuarine epipelic diatoms was reported. The aliphatic hydrocarbon distributions were resolved by capillary gas chromatography and by computerized gas chromatography/mass spectrometry and were shown to be similar to the characteristic crude oil-type sliphatic hydrocarbon distribution found in the estuarine sediment. Crude oil-type polynuclear aromatic hydrocarbons found in the sediment were not present in the diatoms. The possible pathways of selective incorporation of pollutant hydrocarbons into epipelic diatoms and the environmental significance of the process were discussed. (Katz)

5D. Waste Treatment Processes

BILGE WATER TREATMENT WITH A TABULAR ULTRAFILTRATION SYSTEM,
David W. Taylor Naval Ship Research and Development Center, Bethesda, MD.
L. R. Harris, D. F. Jackson, and P. Schatzberg.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 328, Price codes: A03 in paper copy, A01 in microfiche. Report No. DTNSRDC-76-0056, October 1976. 36 p, 11 fig, 5 tab, 11 ref, 2 append.

Descriptors: *Membrane processes, *Separation techniques, *Ultrafiltration, Water treatment, Waste water treatment, Oil spills, Detergents, Cellulose, Waste water, Flux rates, Oil wastes, Olly water, Bilge water, Filtration.

Results of an investigation evaluating the effectiveness of cellulosic (Type A) and noncellulosic (Type D) tubular ultrafiltration (UF) membranes in separating various oils from water are presented. Two commercially available tubular UF membranes, having the same geometry and the same pore size, and three oils were selected for the investigation. It was found that: the type D provided higher UF rates (flux) than the type A, and that the D membrane removed oil in the presence of detergent; removal of oil from water to less than 15 mg/l was achieved with either membrane; flux declining resulting from exposure to bilge water was recovered completely through membrane cleaning with type D only; cumulative irreversible flux decline occurred with type A upon exposure to bilge water; and high removal efficiencies of some dissolved metals found in bilge water was achieved with both membrane types. A schematic diagram of the UF test system is provided. (Davison-IPA)

UPGRADING TEXTILE OPERATIONS TO REDUCE POLLUTION, VOLUME 1: IN-PLANT CONTROL OF POLLUTION.
Environmental Protection Agency, Cincinnati, OH. Office of Technology Transfer
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 429, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-625/3-74-004, October 1974. Vol. 1 of 2. 121 p, 18 fig, 52 tab, 11 ref, 2 append.

Descriptors: *Textiles, *Water pollution, *Air pollution, *Waste water treatment, *Effluents, *Industrial wastes, Chemical wastes, Liquid wastes, Waste water disposal, Recycling, Bleaching wastes, Solid wastes, Solutes, Water requirements, Water Quality Act, Pollution abatement, Water pollution abatement, Solvents, Surveys, Water pollution sources, Water reuse, Flow control, Water conservation.

Water pollution abatement and air pollution abatement are discussed in this first volume of a two volume series on reducing pollution in the textile industry. As a first step in water pollution abatement waste water is characterized by a waste survey involving a preliminary survey, a detailed survey, a data evaluation, and continued monitoring. Major sources of wastes in textile operations are process effluents from: (1) wool scouring, (2) wool finishing, (3) geige goods mills, (4) woven fabric finishing, (5) knit fabric finishing, (6) carpet mills, (7) stock and yarn dyeing and finishing, and (8) specialized finishing. Other areas of water pollution abtement considered are: water reuse, flow reduction, waste segregation, and pretreatment of textile wastes. A panel discussion on the inplant control of pollution examined the substitution of processes and materials. Case histories are used to illustrate programs for water conservation. It is recommended that waste water be segregated so that only dirty water is sent to lagoons, while the more-or-less clean water be used in the dirtier processes. Pretreatment of textile wastes, necessary for protection of the treatment system, involves screening for lint, fiber removal and pH regulation of highly alkaline wastes. It is further recommended that the use of each chemical and its impact on pretreatment, treatment, ecology, and end disposal be thoroughly reviewed. The discussion of air pollution abatement concentrates on an emissions survey, particulate control and solvent recovery. (See also W79-02505) (Daivson-IPA)

UPGRADING TEXTILE OPERATIONS TO REDUCE POLLUTION VOLUME 2; WASTEWATER TREATMENT SYSTEMS.
Metcalf and Eddy, Inc., Boston, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 566, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-625/3-74-004, October 1974. Vol. 2 of 2. 49 p, 10 fig, 7 tab, 4 ref.

Descriptors: *Textiles, *Waste water treatment, *Biological treatment, *Activated carbon, Cost analysis, Aerobic treatment, Trickling filters, Activated sludge, Aeration, Lagooning, Water pollution, Water pollution control, Water pollution abatement, Water quality control, Water treatment, Effluents, Industrial wastes, Chromium, Copper, Mercury, Zinc.

The constantly changing manufacturing processes and resulting waste waters of the textile industry necessitate continued monitoring and upgrading of the waste water treatment systems. The sources of pollution in textile process waste waters include the natural impurities extracted from the fiber along with the processing chemicals, which are either discharged directly or leached during rinsing; traces of the heavy metals, chromium, copper, zinc and mercury, are often found in these waste waters. Biological waste water treatment and granular activated carbon treatment are presented, together with case histories, as effective waste water treatment systems currently being used. Biological treatment methods include: trickling filters, activated sludge, rotating biological disks, extended aeration, and lagoons. The granular activated carbon treatment, relatively new to the textile industry, involves filering the orgaic chemicals from waste waters by passing the water through a bed of carbon, whereby the chemicals are held back by Van de Waals forces, while the water continues to flow through the carbon free of organic contaminants. Construction costs for three common biotreatment methods are presented, and the economics of the granular activated carbon method are discussed. (See also W79-02504) (Davison-IPA)
W79-02505

THE U-TUBE FOR WATER AERATION,
Rocketdyne, Canoga Park, CA.
R. C. Mtichell, and A. D. Lev
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 688, Price codes: A08 in paper copy, A01 in microfiche. Final Report No. R-8043, march 1970. 171 p, 55 fig, 16 tab, 28 ref, 4 append. D1-14-12-434.

Descriptors: *Waste treatment, *Aeration, *Sewage treatment, Waste water treatment, Models, U-tubes, Oxygen, Effluents, Design criteria, Water pollution treatment, Prototype tests, Analytical techniques, Prototypes, Jefferson Parish, Louisiana.

Complete results of the experimental and analytical investigation and the development of the U-tube aeration concept for waste water applications are presented. The three major tasks completed were: (1) experimental verification of oxygen transfer efficiencies and exploration of practical aspects of U-tube operation; (2) analytical investigation of the two key applications -- post aeration of effluent from a sewage treatment plant and in-site aeration of sanitary sewer flows to prevent anaerobic conditions; (3) investigation and design of prototype U-tube systems emphasizing designs for installation in the Jefferson Parish, Louisiana, sewer system. Mass transfer and fluid dynamics behavior of a representative prototype U-tube system for long ranges of design variables and operating conditions are characterized through experimental data. An analytical model of the system is described, and

then applied, using experimental data, to predict performances and operating characteristics of large-scale U-tube systems in various applications. It was found that the U-tube technique is a practical, flexible efficient method, particularly suited to applications for raising the dissolved oxygen concentration of a moving stream. Flexibility in the choice of configurations and other variables allow efficient specific designs in many applications and requirements. Advantages of U-tube aeration systems include: require little space; can be designed with no moving parts; require no operating labor and little maintenance; and have substantial cost savings over conventional aeration methods. ELIMINATION OF WATER POLLUTION BY RECYCLING CEMENT PLANT KILN DUST,
Portland Cement Association, Skokie, IL.
N. R. Greening, F. M. Miller, C. H. Weise, and H. Nagoo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 080, Price codes: A04 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-76-194, July 1976. 68 p, 10 fig, 24 tab, 9 ref. 802196.

Descriptors: *Portland cements, *Separation techniques, *Chemical reactions, Alkali-aggregate reactions, Water pollution, Waste water treatment, Neutralization, Alakli metals, Spraying, Dusts, Industrial wastes, Pyroprocessing techniques.

The feasibility of separating cement plant kiln dust into alkali-rich and alkali poor fractions using fluidized bed, flame-spary and other pyroprocessing techniques was investigated. The effect of varying a number of process parameters on the achievement of the four following goals was studied: (1) effective feeding of the kiln dust raw material; (2) maintenance of flame stability and of adequate temperature to achieve alkali volatilization; (3) achievement of separation of these two fractions until collection was complete; and (4) efficient collection of the two kiln dust fractions. Variations in the process parameters included: the feeding system and fluidizing arrangement; the portion of the system designed for alkali entrapment; the dust collection mechanism; the temperature of the flame and collection system; and the collecting medium. The first two goals were achieved, and after optimization of al the process parameters all goals were achieved. Suggestions for the achievement of the goals in other ways were made after a theoretical study of the operative chemical was made. (Davison-IPA)
W79-02509

CHITOSAN -- A POLYMER FROM SEAFOOD WASTE, FOR USE IN TREATMENT OF FOOD PROCESSING WASTES AND ACTIVATED SLUDGE,
Georgia Univ., Athens, Coll. of Agriculture Experiment Stations.
W. A. Bough.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 078, Price codes: A04 in paper copy, A01 in microfiche. Report No. NOAA-76040901, 5 p, 2 fig, 9 tab, 13 ref. SG-04-5-158-4.

Descriptors: *Chitosan, *Waste treatment, *Food processing industry, *Water pollution, Shellfish, Shrimp, Crab, Coagulation, Activated sludge, Proteins, Polymers, Byproducts, Waste water treatment, Effluents, Water conservation, Food wastes, *Carbohydrates(High molecular weight).

The use of chitosan, a high molecular weight carbohydrate processed from the chitin in shrimp and crab wastes, as a coagulating agent in the treatment of food wastes is discussed. Its use in vegetable processing wastes, poultry processing wastes, egg breaking wastes, activated brewery sludge, activated vegetable sludge, meat processing and curing wastes, shrimp processing wastes and fruit cake wastes are examined. Results of a comparison of the coagulated byproducts obtained from food processing wastes suggest that chitosan would be useful as an agent for reducing waste loads and for byproduct recovery. The recovered protein byproduct also has a potential use as protein in animal feeds. Chitosan was shown to be equal to, or better than other commercially available polymers in performance. ELECTROCHEMICAL BIOCIDE,
Life Systems, Inc., Cleveland, OH.
C. A. Bodo, G. G. See, and R. A. Wynveen.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A028 304, Price codes: A04, A01 in microfiche. Annual Report No. LSI-ER-221-23, May 1976. 52 p, 21 fig, 5 tab, 3 ref. DAMD17-74-C-4102.

Descriptors: *Waste water treatment, *Sewage treatment, *Disinfection, *Microorganisms, Aquatic microorganisms, E. coli, Bacteria, Electrodes, Equipment, Sewage, Electrochemistry, Electric reactors, Water purification, Electrolysis.

An alternate raw sewage treatment method called an Electrochemical Biocide is discussed. The process utilizes low level voltages at chemically-inert electrodes to pass alternating current through the water to destroy microscopic flora. Objectives of this research and development program included: a demonstration of process feasibility; expansion of the Electrochemical Biocide reactor design; determination of the engineering parameters affecting process effectiveness and efficiency; establishment of hypothesis for the microorganism kill mechanism; and recommendations for scaling the process to the requirements of the U.S. Army Medical Research and Development Command and National Aeronautics and Space Administration. The test hardware and process are detailed. Results showed that the microorganisms were completely destroyed. Ten specific direct conclusions and three indirect conclusions resulting from the current research are presented and include: an electrical frequency of less than one cycle per second enhances the effectiveness in destroying microorganisms; the process is more effective in treating sewage water than test water due to the generation of chlorine and hypochlorite; E coli was the cost resistant bacterium; improvement in process performance resulted from increased mass transfer, closer electrode spacing and reduced electrical frequencies; and destruction of the microorganisms takes place at or near the electrode for unbuffered test water without sodium chloride. Further testing is recommended. (Davison-IPA)

EFFECT OF MERCURY ON NADH AND THE PROTECTIVE ROLE OF OXALACETATE,
Georgia Univ., Athens. Dept. of Food Science.
M. K. Hamdy, and O. R. Noyes.
Bulletin of Environmental Contamination and Toxicology, Vol. 17, No. 1, p 112-120, 1977. 2 fig, 1 tab, 16 ref. OWRT B-069-GA(4), 14-31-0001-3870.

Descriptors: *Mercury, Metals, Water Pollution Sources, *Toxicity, Bacteria, *Bioindicators, Biological treatment, *Indicator bacteria biocontrol, *Microbial degradation, Absorption, *Biotransference, Biological uptake, Bacillus lickeninformis, Detoxification, Aquatic environment, *Malate, *Methylmercury, *Oxalacetate.

Effect of mercury chloride (HgCl2) and methylmercury (CH3HgCl) on malate (MDH) and lactate (LDH) dehydrogenases isolated from a mercury-resistant Enterobacter aerogenes was examined. Assays of enzymes were conducted spectrophotometrically at 340 nm. Results showed that the presence of 0.03 micro M CH3HgCl per 3 ml reaction mixture inhibited 12 and 67% of LDH activities, respectively; whereas, 0.03 micro M HgCl2 inhibited 48% of MDH activities. The inhibition was due in part to interaction between HgCl2 and the coenzyme moiety (NADH) of both enzymes as evidenced from changes in spectral characteristics of NADH. Concentration (0.1 micro M/reaction mixture) of other compounds CdSO4, ZnSO4 or CH3HgCl had no effect on NADH. The addition of 0.02 micro M oxalacetate (OAA) but not tartarate, succinate, pyruvate or malate, restored the spectral characteristics of 0.02 micro M NADH. It is suggested that the enol form of DAA (10% at ph 7.0) combines with Hg++ to form a salt complex and thus removes Hg++ from NADH-Hg++ complex. A 10-fold increase in concentration of OAA as compared to HgCl2 is required to protect NADH from the action of mercurials and restore its biological properties and function.

A FIELD STUDY OF TREATMENT VS. DEPTH OF SAND FILL IN A MOUND SYSTEM,
Maine Univ. at Orono. Land and Water Resources Inst.
S. D. Couture.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 392, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, May 1978. 92 p, 27 fig, 6 tab, 38 ref, append. OWRT A-040-ME(1).

Descriptors: Aerobic conditions, Chemical oxygen demand, Coliforms, *Denitrification, Effluents, Groundwater, Nitrates, Nitrification, Nitrogen, *Phosphorus, *Septic tanks, Topsoil, *Waste water treatment, *Waste disposal, Ammonia nitrogen, Fecal coliform, Mound on-site waste disposal systems, Organic nitrogen, Total dissolved phosphorus.

A field study was performed using a mound system designed and constructed to treat septic tank effluent in an area of seasonally high groundwater. The

objective was to measure the treatment of septic tank effluent versus depth of sand fill below the adsorption trench. The system was monitored during four sampling periods (8/77, 9/77, 10/77, and 11/77) for concentrations of soluble COD, total dissolved phosphorus, organic nitrogen, ammonia nitrogen, nitrate, and fecal coliform. Essentially complete removal of total dissolved phosphorus was found to occur within the first six inches of sand fill. Complete removal of the fecal indicator organisms occurred before the treated water intercepted the groundwater table. The internal clay barrier in the toe of the mound prevented ponded effluent from seeping out of the toe. It was concluded that the first six inches of the sand fill below the adsorption trench was aerobic and the lower portion of the sand fill below the adsorption trench and the original underlying soil were anaerobic. The situation of aerobic fill/anaerobic topsoil allowed for nitrification and denitrification to occur within the mound fill and underlying soil.

THE EFFECT OF TEMPERATURE ON TREATMENT PLANT PERFORMANCE AND RELATED TEMPERATURE STUDIES,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
J. J. McKeown, A. Benedict, D. Buckley, and K. Dussik.
NCASI Stream Improvement Technical Bulletin, No. 312, 82 p, May, 1978. 34 fig, 12 ref, 17 ref, append.

Descriptors: *Pulp wastes, *Waste water treatment, *Temperature, *Aerated lagoons, Wastes, Industrial wastes, Water pollution treatment, Water pollution sources, Pulp and paper industry, Heat balance, Foaming, Biological treatment, Biochemical oxygen demand, Suspended solids, Thermal insulation, Effluents.

Based on information provided by more than 60 pulp and paper mills currently participating in the continuing treatment plant performance analysis project maintained at the NCASI northeast regional center, this study on the effect of temperature on effluent treatment showed that heat loss in aerated stabilization basin systems is a function of surface area exposed to the atmosphere, independent of surface aerator horsepower intensity, and is affected by foam which acts as a thermal insulation barrier. The temperature of the biological reactor was a major factor in final effluent BOD and suspended solids concentrations and was predictable within the monthly average extremes of 5 and 40C. The correlation between temperature and BOD reduction was found to be adequate to incorporate predictive modeling. The same was not true for suspended solids, however, although within a single treatment system a rise in BOD concentration generally resulted in a rise in suspended solids concentration. NUTRIENTS, TOXINS, AND WATER IN TERRESTRIAL AND AQUATIC ECOSYSTEMS TREATED WITH SEWAGE PLANT EFFLUENTS - FINAL REPORT OF THE UPLAND RECHARGE PROGRAM,
Marine Biological Lab., Woods Hole, MA.
G. M. Woodwell, J. T. Ballard, J. Clinton, and E. V. Pecan.
Brookhaven National Laboratory, Report BNL 50513, 39 p, January 1976. 10 fig, 12 tab, 11 ref, 2 append.

Descriptors: *Sewage treatment, *Aquatic plants, *Deciduous trees, *Nutrients, Sewage effluents, Water quality, Water analysis, Ecosystems, Plant populations, Percolating water, Percolation, Phosphorus, Iron, Marshes, Marsh plants, Waste treatment, Water treatment, *Sere.

The objective was to appraise the capacity of terrestrial and aquatic plant communities for absorbing and retaining nutrients and organic matter in sewage and for releasing 'clean' water. The results showed the following: (1) Under normal circumstances, without the addition of water or nutrients in sewage, the flux of nutrients into the groundwater was greatest under the agricultural communities and least under the late successional forest communities; (2) The highest concentrations of nutrients in the percolate of the untreated communities commonly occurred in the earliest stages of succession; (3) Treatment with sewage reduced the differences in concentration in the percolate between the communities of the sere; (4) Calculation of the budgets of the various ecosystems showed that the forested stages accumulated the largest fractions of the inputs; (5) Appreciable changes occurred in the quality of percolate under the controlled communities over the period of the experiment; and (6) Present indications are that if sewage-treatment systems using natural communities are to be devised, they will require combinations of aquatic and terrestrial systems. (EIS-Deal)

ANALYSIS OF MODELS FOR DICHLORAMINE REMOVAL BY ACTIVATED CARBON IN BATCH AND PACKED-BED REACTORS USING QUASILINEARIZATION AND ORTHOGONAL COLLOCATION METHODS,
Illinois Univ. at Urbana-Champaign. Dept. of Chemical Engineering.
B. R. Kim, R. A. Schmitz, V. L. Snoeyink, and G. W. Tauxe.
Water Research, Vol. 12, p 317-326, 1978. 5 fig, 2 tab, 17 ref. S-051-ILL

Descriptors: *Activated carbon, Chlorination, Nitrogen chemical reactions, Chemical reduction, Model studies, Waste water treatment, *Mathematica models, *Dichloramine, Dechlorination, Chlorine residuals.

The reaction between dichloramine and activated carbon in batch and packed bed reactors has been described by a mathematical model involving proe transport and surface reaction rate as rate limiting steps. The poisoning of the surface resulting from the build-up of reaction products on the surface has also been taken into account. The orthogonal collection method was successfully used to solve models. Quasilinearization was used to determine necessary constants from batch reactor data, and these constants were used to accurately predict breakthrough curves for packed bed reactors.

POLYMER COAGULATION OF HUMIC ACID WATERS,
Clarkson Coll. of Technology, Potsdam, NY. Dept. of Civil and Environmental Engineering.
J. K. Edzwald, J. D. Haff, and J. W. Boak.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 103, No. EE6, p 989-1000, December 1977 12 fig, 15 ref.

Descriptors: *Water supply, *Waste water treatment, *Flocculation, *Coagulation, *Polymers, Color, Humic acids, Environmental engineering, Alum, Effects.

The removal of color from water supplies using alum, polymers, and alum-polymer combinations is described. Humic acid was used as the natural color colloid and the results indicate that: (1) Alum alone requires relatively high dosages; (2) low molecular weight cationic polyelectrolytes used alone chemically interact with humic acid; and (3) alum combined with high molecular weight polymers is an effective coagulation process. Stoichiometry between the raw water humic acid concentration and the optimum coagulant dosage is reviewed. Experimental results are used to examine the stability of humic acid and mechanisms of particle destabilization. (Bell-Cornell)

A FRESH WATER WASTE RECYCLING-AQUACULTURE SYSTEM,
Harbor Branch Foundation, Inc., Fort Pierce, FL
J. H. Ryther, L. D. Williams, and D. C. Kneale.
Florida Scientist, Vol. 40, No. 2, p 130-135, Spring, 1977. 1 fig, 1 tab, 14 ref.

Descriptors: *Aqiculture, *Biological treatment, *Waste water treatment, *Nutrient removal, *Sewage effluents, Fish, Shrimp, Algae, Phytoplankton, Nitrogen, Phosphrous, Biomass, Grass carp.

The treatment system was tested during the period 3 March 1975-29 August 1975 in two 11 x 4 x 0.6 m (25,000 l) PVC-lined earthen ponds. One pond was inoculated with the macroscopic alga Chara sp. Undiluted secondary effluent was passed through this pond at a rate of 500 l/day providing a turnover rate of 2% of the pond volume/day. Removal efficiencies for nitrogen and phosphorus were 83 and 87%, respectively. The second pond was stocked with 28 juvenile (20 g) grass carp. The fish were fed the harvest growth of the Chara. During the study period fish biomass showed an increase of 4.5 kg. Seventy-five juvenile (1.7 g) fresh water shrimp were added to the second pond to utilize potential food wastes from the inefficient grass carp. Shrimp biomass increased 1.2 kg during the study period. Problems encountered with this system were difficulty in handling Chara without retarding its growth and dense phytoplankton blooms. (Stihler-Mass)

CHEMICAL TREATMENT FOR ORGANIC COLOR REMOVAL FROM GROUNDWATERS,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
J. E. Bowie, Jr
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 209, Price codes: A12 in paper copy, A01 in microfiche. Doctoral Dissertation, August 1978. 244 p, 65 fig, 12 tab, 100 ref, 3 append. OWRT A-084-MISS(3), 14-31-0001-5024.

Descriptors: *Waste water treatment, *Chemical precipitation, *Water treatment, *Color, *Groundwater, *Chemical reactions, *Water purification, Coagulation, Flocculation, Oxidation, Reduction, Ultraviolet radiation, *Humic acids, Hydrogen ion concentration, Alum, Sodium sulfite, Cations, Ozone, Hydrogen peroxide, Polyelectrolytes.

A chemical treatment system for removing highly colored humic acid type compounds from water was developed. Four types of systems were tested: chemical precipitation-coagulation, oxidation/reduction, photo-oxidation/reduction, and polymerization. Both divalent and trivalent cationic precipitation coagulation systems were examined in which the color-causing organics are actually physially removed from the system. Trivalent cations were more efficient than divalent ones requiring only 1/10 the dosage for complete color removal and zeta-potential neutralization. A system was developed combining addition of alum and cationic polyelectrolyte and adjustment of pH to 5.5. The order of chemical addition, rapid mix, and flocculation stages of this system were optimized and the results tabulated. Of the oxidation and reduction treatments studied, only oxidation by ozone and hydrogen peroxide were effective in reducing color. Ultraviolet light treatment alone was ineffective, but irradiation with ultraviolet accelerate oxidation/reduction reactions and drive some reactions closer to completion. Ultraviolet was especially effective when used with sodium sulfite reduction, which alone was unreactive. Polymerization was totally unacceptable as a color remover It is recommended that further research be done on four methods: (1) chemical precipitation-coagulation with or without polyelectrolytes, (2) ozonation; (3) ultraviolet light-air treatment with or without hydrogen peroxide; (4) ultraviolet light -

sodium sulfite treatment in inert atmosphere. (Majtenyi-IPA)

A CHEMICAL AND BIOLOGICAL EVALUATION OF THREE MINE DRAINAGE TREATMENT PLANTS,
Environmental Protection Agency, Wheeling, WV. Surveillance and Analysis Div.
S. C. McPhilliamy, and J. Green.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 453, Price codes: Ao5 in paper copy, A01 in microfiche. June 1973. 81 p, 6 fig, 17 tab, 6 ref.

Descriptors: *Coal mine wastes, *Mine acids, *Waste water treatment, *Sampling, Evaluation, Treatment plants, Streams, Stream flow, Benthos, Aquatic plants, Water chemistry, Water analysis, Pollutant identification, Water quality, Pennsylvania.

Three mine drainage plants, Bercik, Kefovor and Thompson, operating at Jones and Laughlin Steel Corporation mines in Washington County, Pennsylvania, were selected for chemical and biological sampling. A fourth site, representing an untreated effluent discharged to a tributary and located on the Little Indian Creek north of Riversville, West Virginia, was selected as a control station. Chemical samples collected from four areas at each of the treatment plants included: the receiving stream above and below the tratment plant; the untreated mine discharge being pumped from the borehole; and the treated effluent before its discharge into the receiving stream. Similar samples were collected at the control site. Ten additional parameters were included for analysis along with those associated with mine drainage. Generally, the plants were effective in removing common mine drainage parameters, but two of these plants occasionally discharged final effluent containing excessive concentrations of acidity, suspended iron and total iron. The treated mine effluent below the three plants affected the benthos in the receiving streams. The most effective treatment plant, Kefover, has a larger receiving stream flow which dilutes the residual chemical constituents to a more tolerable level; the benthos in the receiving stream were only slightly affected. Thompson Plant, as effective as the Kefover Plant, occasionally discharged acid slugs, reducing its overall treatment capability. The benthos is severely depressed immediately below the Bercik Plant, the least efficient of those studied. The limited dilution capacity of the receiving stream impairs its operationa effectiveness. OWENS-CORNING FIBERGLASS CORPORATION WASTEWATER TREATMENT FACILITY, ANDERSON, SOUTH CAROLINA, TECHNICAL SUPPORT PROJECT MARCH-MAY 1973.
National Field Investigations Center-Cincinnati, OH.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-231 123, Price codes: A05 in paper copy, A01 in microfiche. December 1973. 85 p, 30 fig, 11 tab, 7 append.

Descriptors: *Waste treatment, *Treatment facilities, *Effluent quality, *Industrial wastes, *Training, Samples, Chemical analysis, Sludge, Testing, Sampling, Aerobic digestion, Coagulation, Biological oxygen demand, Acidity, Solid wastes, Water pollution, Measuring instruments, Suspended solids, Owens-Corning Fiberglass Corporation, Anderson, South Carolina.

To improve performance of the Owens-Corning Fiberglass Facility, at anderson, South Carolina, operators were trained in the use of the National Field Investigation Center (NFIC) operational control procedures. They were taught how to calculate control adjustment demands from sludge quality and process status tests, and how to display essential test data and process relationships, which would allow analysis of process response to control adjustments. In completing the evaluation of plant loadings and process response to control adjustments many components were calculated, tabulated, and/or plotted. Operator skill was acquired during the project so that final effluent quality became consistent, and the plant was able to withstand 'shock loads.' The loadings and treatment accomplished during the final 77 days of the support project are tabulated. (Davison-IPA)

THE USE OF THE PROTOCOCCACEAE FOR PURIFYING WASTE WATER (PRIMENIYE PROTOKOKKOVYKH VODOROSLEY DKYA OCHISKI STOCHNYKH VOD),
V. N. Yuzvenko.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 711-T, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA-BTR-76-14, 1971. Sakhaarnaya Promyshylennost', Vol. 45, No. 11, pp 20-22, 1971. Translated by SCITRAN (Scientific Translation Service), Santa Barbara, CA. 6 p, 1 tab.

Descriptors: *Waste water treatment, *Algae, *Agricultural wastes, *Sugar beets, Water purification, *Protococcaceae chlorella, Cenedesmus, Lime, Neutralization, Filtration, Lagoons, Waste water, Coagulation, Sedimentation, Ukraine, USSR, Soil disposal fields, Soil properties.

A method for purifying sugar process waste water in filtration fields is described. The filtering capacity of the soil in filtration fields at sugar plants in the Ukraine, SSR is very poor, and the natural processes of autopurification occur very slowly or not at all. The natural processes are intensified somewhat through liming these waste waters, and it was found that these processes were further enhanced with the addition of mixtures of Protococcaceae chlorella and cenedesmus. Waste water is first limed to neutralize it because the oxidizing micro-organisms favor a neutral or slightly alkaline medium. Liming also facilitates coagulation of the colloid compounds in waste water, enhancing sedimentation of suspended particles. Liming is conducted during the production season and terminates at least three months before planting the algae in the waste water. Milk lime is used and introduced in an irrigation agitator with the water temperature at 5C. Algolization, seeding the waste water with mixture of Protococcaceae chlorella and cendesmus in paste or suspension, creates an algae concentration which will ensure a predominance of algae over the entire purification period. Algolization is conducted in two stages: (1) the algae are planted in a reservoir for primary algolization, and (2) when the waste water becomes an algae suspension, it is immediately dispersed into remaining reservoirs of waste water as stage two. Results of algolization of waste water in reservoirs of filtration fields at sugar plants in Vinitsa, Kiev, and Odessa are tabulated. (Davison-IPA)

EXPERIENCE WITH WASTE WATER ACID NEUTRALIZATION (ERFAHRUNGEN MIT ABWASSER-SAUREZNEUTRALISATION),
B. Kratz.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 198, Price codes: A02 in paper copy, A01 in microfiche. Vom Wasser, No. 17, pp. 83-88. Dece 10, 1974, 12 p, 3 fig, 1 tab. Translated b Army Medical Intelligence and Information Agency, Washington, DC. Translation No. USAMIIA-K-5240.

Descriptors: *Waste water treatment, *Industrial wastes, *Acidic water, *Nitrogen compounds, *Neutralization, Sludge, Lime, Aeration, Explosives, Equipment, Filters, Toxic wastes, Water requirements, Water cooling, Water chemistry, Water analysis, Effluents, Germany.

The waste water treatment systems and processes of trinitrotoluene (TNT) plants built in Germany during the mid 1930s are examined. In producing 4,000 tons of TNT per month, 40,000 m3 per day of water were consumed; 5 to 6,000 m3 of this was acidic waste water contaminated with nitrogen compounds. There were three varieties of waste water: manufacturing was water; condensate from sulfuric acid concentration; and building cleaning waste water. The development of the waste treatment process from a clarification system to a formal treatment plant is discussed, and a schematic view of the neutralization plant is provided. (Davison-IPA)

OXIDATION OF PESTICIDES BY OZONE AND ULTRAVIOLET LIGHT,
Houston Research, Inc., TX.
C. E. Mauk, H. W. Prengle, Jr., and J. E. Payne.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 306, Price codes: A04 in paper copy, A01 in microfiche. Final Report No. 7206, July 1976. 73 p, 13 fig, 46 tab, 6 ref. IT76270D048-07, DAAG53-76-C-0089.

Descriptors: *Waste treatment, *Waste water treatment, *Pesticide removal, *Toxic wastes, *Ozone, *Ultraviolet radiation, DDT, Pentachlorophenol, Vapam, Baygon, Models, Mathematical models, Gas chromatography, Water purification, Water quality control, Effluents, Potable water, Water pollution treatment.

An experimental study to determine the feasibility of the oxidative destruction in water of the five pesticides, malathion, Baygon, Vapam, pentachlorophenol, and DDT, by ozone with ultraviolet light is reported. The individual pesticides were treated by ozone with varying combinations of ultraviolet intensities and temperatures in a sparged stirred tank reactor. Gas chromatographic analysis indicated destruction of the pesticide and that the total organic content of the water, including contributions from the pesticide and intermediate oxidation products, was reduced to the limit of detectability. A mathematical model was developed, from which constants were calculated characterizing the reactions. The resulting data will permit the design of prototype treatment equipment for the removal of pesticides from effluents or potable water. (Davison-IPA)

PCBS WATER ELIMINATION/REDUCTION TECHNOLOGY AND ASSOCIATED COSTS, MANUFACTURERS OF ELECTRICAL CAPACITORS AND TRANSFORMERS,
Versar, Inc., Springfield, VA.
R. Durfee.
Available from the National Technical Information Service, Springfield, VA 22161, Price codes: A03 in paper copy, A01 in microfiche. Addendum to Final Report, Task II, Report No. EPA 440/9-76-020, July 2, 1976. 39 p, 2 fig, 9 tab, 8 ref. 68-01-3259.

Descriptors: *Waste pollution sources, *Industrial wastes, *Polychlorinated biphenyls, *Waste identification, Industrial plants, Cooling water, Water pollution, Water pollution control, Vacuum pumps, Waste water, Cost analysis, Estimated costs, Discharge(Water), Cost comparison, Waste water treatment.

The quantities and sources of the waste waters within the askarel capacitor and transformer manufacturing industry are summarized. Waste waters containing measurable quantities of PCBs are dis-

charged at seven point sources: (1) non-contact cooling water; (2) water-sealed vacuum pumps and steam-jet ejectors; (3) detergent washing of components and assemblies; (4) boiler blowdowns, air conditioning condensates, and contact cooling water; (5) contaminated process wastewaters; (6) sanitary and personal hygiene waste waters; and (7) the wet scrubber for the waste incinerator flue gas at one plant. Technologies for eliminating these discharges are described, and a method for estimating the costs of this elimination is presented. Estimated costs to achieve zero discharge on an industry wide basis extrapolated from survey data of eight plants are tabulated. The technologies and costs for eliminating PCB contamination of rainwater runoff from storage and material transfer areas of these plants are discussed. Three alternate approaches for the reduction of PCBs in the direct discharges of these plants and their estimated costs are presented. The selected approaches offer a range of PCB controls at various cost levels. (Davison-IPA)

CONTAINER CORPORATION OF AMERICA BREWTON MILL-CONECUH-ESCAMBIA RIVER BASIN STUDY II,
Environmental Protection Agency, Atlanta, GA. Surveillance and Analysis Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-213 301, Price codes: A04 in paper copy, A01 in microfiche. Progress Report, November 1971. 52 p, 10 fig, 6 tab, 4 append.

Descriptors: *Industrial wastes, *Waste water treatment, *Water pollution abatement, *Water pollution sources, Bleaching wastes, Chemical wastes, Pulp wastes, Pulp and paper industry, Waste treatment, Effluents, Aeration, Oxidation, Water chemistry, Liquid wastes, Suspended solids, Organic wastes, Container corporation of America, Conecuh-Escambia River Basin, Alabama, Biochemical oxygen demand.

An evaluation of the waste treatment at Container Corporation of America's (CCA) Integrated Pulp and Paper Mill located at Brewton, Alabama, is reported. A previous report, 'Effect of Pollution on Water Quality. Escambia River and Bay, Florida' identified Brewton Mill as the major source point of carbonaceous wastes discharged into the Conecuh-Escambia River and recommended removal of 90% of the carbonaceous waste generated by this mill. The pollution abatement program initiated by CCA included the addition of a 22-acre aeration basin using ten-75 horsepower aerators. Existing operating treatment units included a clarifier, liquid oxygen application, oxidation pond, and ponding in six natural lakes. Unbleached pulp processing wastes amounting to 17.2 mgd is routed through the treatment units; bleachery waste and woodyard drainage of 17.3 mgd are treated only by the natural lakes. A comparison of study results of the August 1970 and June 1971 surveys is presented. Nine specific conclusions drawn from the present study indicate: that BOD5 reductions are in excess of the recommended 90%; secondary treatment and improved in-plant controls reduced the discharged effluent to less than half of the recommended 4,850 pounds per day limit; CCA has not complied with the recommendation of secondary treatment for bleach plant and woodyard wastes; all waste loadings were reduced; and measurements of water parameters indicated relatively good water quality in the Conecuh-Escambia River tributaries. Water quality data obtained during the June and July 1971 survey are tabulated. (Davison-IPA)

STUDY ON POWER-LAUNDRY WASTEWATER TREATMENT,
Army Mobility Equipment Research and Development Center, Fort Belvoir, VA. Sanitary Sciences Div.
D. S. Lent.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A008 332, Price codes: A05 in paper copy, A01 in microfiche. Final Technical Report No. 2118, November 1974. 89 p, 22 fig, 28 tab, 7 ref, 8 append. 1G763702DK39-31.

Descriptors: *Waste water treatment, *Laundering, *Water pollution abatement, *Water purification equipment, Water chemistry, Polyelectrolytes, Trace elements, Water quality, Biochemical oxygen demand, Activated carbon, Heavy metals, Laboratory tests, Polymer, Suspended solids, Effluents, Detergents, Cation adsorption, Sampling.

An evaluation of the effectiveness of a waste water treatment process utilizing powdered, activated carbon, a cationic polyelectrolyte, and a modified, standard military water-purification unit (ERD Lator) for the treatment of commercial-type (power) laundry waste waters is reported. Field tests were carried out at Sterling Laundry, Washington, D.C. The following laboratory analyses were performed: turbidity, hydrogen and ion concentration (pH), detergents, biochemical oxygen demand (BOD), conductivity, total organic carbon (TOC), suspended solids, hexane solubles, and heavy metals, including mercury, antimony, copper, lead, zinc, chromium, silver, iron and nickel. It is concluded that: (1) the carbon/polymer/ERD Lator process effectively restores power-laundry effluents to a suitable quality for reuse or discharge into navigable waters, complying with proposed Environmental Protection Agency effluent limitation guidelines; (2) the fluctuations in the chemical characteristics of these waste waters does not affect the quality of the restored water; and (3) pH or total dissolved solids are not significantly changed by the process. EFFECTS OF WASTEWATER PROCESS OPERATION ON ORGANICS IN POTABLE WATER SUPPLIES,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
C. Aemisegger, W. P. Bonner, R. B. Bustamante, and R. W. Lowhorn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 340, Price codes: A06 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center University of Tennessee, Knoxville. Research Report No. 68, December, 1978. 109 p, 33 fig, 5 tab, 77 ref. OWRT A-048-TENN(1), 14-34-0001-8045.

Descriptors: *Rotating biological contractors, *Nitrification, Organic compounds, Water supply, Potable water, *Biological treatment, Films, *Chemical oxygen demand, Waste water treatment, *Refractory compounds, Treatment facilities, Performance.

The primary purpose was to ascertain whether the soluble chemical oxygen demand (COD) discharged from a typical film-type biological treatment plant is residual or refractory in orgin and the extent to which nitrification takes place. This research should also determine where and under what conditions transformations between residual and refractory compounds occur in biological film treatment units. The experimental work was conducted on a 16 stage laboratory scale rotating biological contactor typical of fixed film-type treatment processes. Feed consisted of a chemically defined source of carbon, glucose, plus essential nutrients and trace metals. Soluble COD, glucose, ammonia, nitrite, nitrate and specific low molecular weight voltile organics were determined as a function of treatment stage, pH, and rotational speed. The soluble organics in the effluent of the laboratory scale treatment unit were refractory and consisted of detectable quantities of acetic and propionic acids and other organics exhibiting a COD. Under normal operating conditions the soluble COD varied inversely with contact time and rotational speed. COD removals of between 85 and 93% were obtained. Under adverse pH conditions typical of treatment plant malfunction or misoperation, ie. low pH, the soluble COD through the treatment plant decreased to a minimum between stages 6 and 10 and then increased through stage 16. Nitrification was suppressed at higher rotational speeds and with an increase in the ionic strength of the solution

MICROBIOLOGICAL CONSIDERATIONS OF OZONE TREATMENT OF REUSE WATER IN FISH HATCHERIES,
Idaho Univ., Moscow.
P. J. Colberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 342, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, August 1977. 65 p, 15 fig, 26 ref. OWRT A-053-IDA(1), 14-34-0001-7027/7028.

Descriptors: Fish, Fish hatcheries, *Fish diseases, Fish populations, *Ozone, Carbon, Ammonia, Nitrites, Water chemistry, Nitrification, Disinfection, *Ozonation, Water reuse, *Fish pathogens, Bacteria, Waste water treatment, Micorbiology, Oxidation.

The effectiveness of ozone as an alternative to current ultraviolet disinfection of makeup water and its potential for treatment of recycled water in commercial reuse hatcheries was considered. Comparative survival rates in water were established for four bacterial fish pathogens (Aeromonas salmonicida, Aeromonas liquefaciens, Pseudomonas fluorescens, and the causative agent of Hagerman Redmouth Disease) and spores of BAcillus polymyxa during batch and continuous flow ozonation in the laboratory. Greater than 99% mortality of the fish pathogens was observed within 60 seconds contact during continuous flow exposure at all concentrations of ozone applied. Spores of B. polymyxa were resistant at a residual concentration of 1.0 mg/l. The oxidation of the combined bacterial-protozoan biomass closely approximated oxidation rates established for the pure culture studies with no significant difference in relative survival rates between bacteria and protozoa. Increased ozone concentrations caused increased mortaity rates, while elevated carbon levels did not appear to exert a preferential ozone demand when added to suspensions of test organisms. Results of the survival studies refute 'all-or-none' phenomenon reportedly associated with ozone treatment. (Trihey-Idaho)

ANAEROBIC DIGESTION AND REVERSE OSMOSIS SEPARATION FOR THE TREATMENT OF DOMESTIC LIQUID WASTE,
Thayer School of Engineering, Hanover, NH.
J. M. S. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 329, Price codes: A09 in paper copy, A01 in microfiche. M.S. Thesis, August 1975. 170 p, 26 fig, 17 tab, 61 ref. OWRT A-034-NH(1), 14-31-0001-5029.

Descriptors: Sewage effluents, Sanitary engineering, *Semipermeable membranes, *Reverse osmosis, *Anaerobic digestion, Domestic wastes, Membranes, Membrane processes, *Waste water treatment, *Digesters, Environment, Pollution.

A new system employing a semipermeable membrane to process home sewage is proposed. The waste water from the home is treated in a three stage tank which acts as an anaerobic digestor and a settling chamber. The effluent is then pumped under pressure to a unit containing a semipermeable membrane. The nutrients and the microorganisms are retained by the membrane and returned to the digester. The product of the membrane unit can be disposed into the environment without further treatment. The research indicates that (1) the digester will operate properly at the higher organic and mineral load which results from operation in conjunction with the membrane unit, (2) the effluent of the system may be disposed into the environment without fear of pollution, (3) cyclic operation consisting of short pressurized and depressurized periods will reduce concentration polarization at low bulk flow velocities, (4) the cellulose acetate membrane will maintain its integrity for at least a year while processing septic effluent. Full scale

prototype testing is the recommended action for further development.

R. F. Probstein, and M. A. Delichatsios.
Available from the Natinal TEchnical Information Service, Springfield, VA 22161 as AD-A041 479, Price codes: A02 in paper copy, A01 in microfiche. Omaggio A Carlo Ferrari, Torino (Italy), p 635-642, December 1974. 2 fig, 6 ref. ONR-N00014-67-A-0204-0057.

Descriptors: *Coagulation, *Colloids, *Waste water treatment, *Model studies, Mathematical models, Laboratoryf tests, Flow, Turbulent flow, Particle size, Pipe flow, Colloidal particles, Destabilization.

This study was an attempt to obtain a better understanding of how dispersed colloidal particles coagulate into larger size flocs under the action of a turbulent flow field. It was anticipated that the information developed on the physiochemical hydrodynamics of this process would lead to the more efficient design of wastewater treatment systems where coagulation of colloidal particles is normally a prerequisite to filtration, sedimentation, or flotation. FEASIBILITY OF REMOVING PHENOLS FROM SURFACE WATERS BY CARBON ADSORPTION,
Louisville Univ., KY. Dept. of Civil and Environmental Engineering.
J. S. Zogorski, and S. D. Faust.
In: Proceedings, Second World Congress, International Water Resources Association, New Delhi, India, December 1975, Vol. II, p 89-97. OWRT A-033-NJ(3), 14-31-0001-4030.

Descriptors: Water quality, *Water quality control, *Waste water treatment, *Phenols, *Activated carbon, Odor, Taste, Water treatment, Adsorption, Carbon adsorption.

Historically, the design of granular activated carbon has been concerned primarily with hydraulic consideration. Presently, individuals who are designing activated carbon systems are becoming more aware of the necessity of evaluating the chemical and physical aspects inherent in the adsorption process. Adsorption is a physiochemical process. Consequently, the design and operation of activated carbon units cannot be optimized unless the physical and chemical aspects of the adsorption process are also considered. Physical and chemical parameters associated with the adsorbate, adsorbent and experimental system were evaluated for their influence on the adsorption of phenols with activated carbon. Characteristics evaluated included temperature, solubility of adsorbate, type of adsorbate, concentration of adsorbate, extent of protolysis, carbon particle size, depth of adsorbent and linear velocity. A qualitative summary of these physiochemical parameters on the operation efficiency of a fixed-bed carbon was developed. In addition, the overall feasibility of removing phenols from aqueous solution by carbon adsorption is presented.

AEROBIC DIGESTION OF WASTEWATER SLUDGE UNDER LOW TEMPERATURE CONDITIONS,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
P. L. Bishop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 519, Price codes: A06 in paper copy, A01 in microfiche. Water Resource Center, Univ., of New Hampshire Research Report No. 18, 1978. 115 p, 23 fig, 12 tab, 64 ref. OWRT A-037-NH(3), 14-31-0001-4029.

Descriptors: *Waste water treatment, *Aerobic digestion, *Aerobic treatment, *Sludge digestion, *Temperature, Activated sludge, Mixing, Phosphorus, Digestion, Nutrients, Sludge, Sludge treatment, Filtration, Sewage treatment, Digestion, Batch reactors, Continuous flow reactors, Settleability, Filterability, Volatile solids, Oxygen uptake, Primary sludge, Secondary sludge, Nutrient transformations.

The main purposes were to investigate the effect of cold temperatures (5 to 30C) on the aerobic digestion process, and the fate of nutrients (nitrogen and phosphorus) in the sludge during digestion. Studies were performed using primary sludge from two locations and waste activated sludge from two others; both batch and continuous flow reactors were used. The effect of temperature on digestion operation and digestion kinetics was determined by operating digesters at varying temperatures, detention times and loading rates, and analyzing for both solids and organic destruction. Changes in settleability and filterability of the sludge were also measured. Nutrient transformations during digestion were determined by maintaining a nutrient mass balance during the aerobic digestion process.

WASTEWATER DISINFECTION IN CANADA,
Canadian Environmental Protection Service, Economic and Technical Review, Report No. EPS 3-WP-78-4, 99 p, May, 1978. 172 ref, 7 tab, 3 append.

Descriptors: *Waste water(Pollution), *Disinfection, *Canada, Effluents, Wastes, Waste treatment, North America, Foreign countries, United States, Europe, Chlorination, Water purification, Water quality control, Diseases, Chlorine, Byproducts, Microorganisms, Costs, Environmental effects, Aquatic microorganisms, Aquatic life, Water treatment, Public health, Human pathology.

This report summarizes existing waste water disinfection requirements throughout Canada, and in the U.S.A. and Europe. The effectiveness of chlorination in combatting the spread of waterborne disease is assessed, and the possible effects of residual chlorine and chlorination by-products on man and aquatic species are discussed. Disinfection alternatives are reviewed with respect to their effectiveness in reducing pathogens, availability, relative costs, environmental impact, and other practical considerations. The protection of both public health and the environment must be taken into account when formulating policies and criteria for waste water disinfection. (Witt-IPC)

PAPER PULP COMPOUNDS CONTAINING ACTIVE SLUDGE,
Soviet Patent SU 440468. Issued January 31, 1975. Soviet Inventions Illustrated, Vol. W, No. 27, p F1-F2, August 12, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, Pulp and paper industry, Patents, *Activated sludge, Recycling, Sludge disposal, Economics, *Pulp wastes, Cardboard, Punch resistances, Ring compression values.

A process for using the waste activated sludge from pulp and paper processing effluent treatment plants in packaging materials manufacturing has been patented. Activated sludge from a plant for the biological purification of waste water from a paper and pulp factory is added to paper pulp (for economy and improved strength) in the following proportions: fibrous components, 8-95 percent; and, activated sluge, 5-20 percent. The sludge is added to the ground and sized fibrous mass as it is passed to the mixer pump, before pouring. Unbleached sulfate celluose 24 degrees Schopper-Riegler was sized with rosin precipitated with clay. Prior to pouring, activated sludge suspension with a concentration of about 20 g/liter was added to the cellulose pulp (to the extent of 5 percent of the dry fiber weight). Cardboards weighing 200 g/sq m and 260 g/sq m were poured. The respective punch resistances were 8.1 and 9.95 kg/sq cm, and the respective ring compression values were 2.51 and 3.38 kg. Without the addition of activated sludge, the respective punch resistances were 6.9 and 9.2 kg/sq cm, and the respective ring compression values were 6.9 and 3.4 kg. (Orr-FIRL)
W79-02941

ADSORBENT FOR INDUSTRIAL EFFLUENTS PREFERABLY CONTAINING DYES,
Belgian Patent BE-821-941. Issued May 7, 1975. Derwent Belgian Patents Report, Vol. W, No. 21, p D1, July 1, 1975.

Descriptors: *Waste water treatment, *Patents, *Industrial wastes, Tanneries, Textiles, Pulp and paper industry, Dyes, Adsorption, Activated carbon, Chemical precipitation, Polymers.

An adsorbent has been patented for the treatment of aqueous industrial wastes particularly from the treatment baths in the textile, paper, or leather industries or from dye or optical whitener manufacturing. The adsorbent contains a support pretreated with precipitating agents and activated carbon. The supports are synthetic plastics, mineral fillers such as cellulosic materials and mixtures of these. The precipitating agent is preferably a basic nitrogen polymer, such as a polyamide-polyamine from a fatty acid polymer and a polyamine, an aminoplast, or a polyalkyleneimine. The precipitating agent may be associated with a polyanionic polymer, prticularly an alpha, beta-ethylenic unsaturated acid, or a polyvalent metal salt or both. The treatment is performed at 10 to 150 C, but preferably between 30-100 C, with the adsorbent in the form of a filter. Adsorbents may also contain from 2 to 95 percent activated carbon, especially 10-70 percent carbon. The mixture of the adsorbents has a greater adsorbing power than carbon alone and is an efficient and economical water treatment process for the above type of effluents. (Orr-FIRL)

COLOUR AND TOXICITY REMOVAL FROM BLEACH PLANT EFFLUENTS USING A HIGGINS CONTACTOR,
Atlantic Analytical Services Ltd., St. John (New Brunswick).
W. J. Wilson, J. T. Wearing, and S. M. Miller.
Canadian Environmental Protection Service, Ottawa, Ontario K1A 1C8, Cooperative Pollution Abatement Research (CPAR) Project Report 544-1, March, 1977. 47 p. 5 fig, 17 ref, 16 tab.

Descriptors: *Bleaching wastes, *Waste water treatment, *Decoloring, *Detoxification, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Color, Toxicity, Pulp wastes, Pulp and paper industry, Adsorption, Biochemical oxygen demand, Fish, Flow rates, Hydrogen ion concentration, Solids contact processes, White liquor(Kraft process), Kraft mills.

Adsorption of bleached kraft mill effluents (chlorination-stage and alkaline extraction waste liquors) on Amberlite XAD-8 achieved color removals of 70 to 85% in addition to BOD reductions and excellent toxicity removal, the treated effluents being nontoxic to fish at 100% concentration. The adsorbent's efficiency depended on flow rate, being better at low flow rates. The alkaline extraction effluent had to be adjusted to pH 2.5 (similar to that of the chlorination-stage effluent) before adsorption became effective. Of two regenerant

streams tested, white liquor was effective, but chlorine dioxide generated effluent was not. Present operating data indicate that the use of a Higgins continuous countercurrent contactor offers no significant advantage over a fixed-bed system. (Brown-IPC)

FEASIBILITY OF THE FUNCTIONAL USE OF VEGETATION TO FILTER, DEWATER AND REMOVE CONTAMINANT FROM DREDGED MATERIALS,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Effects Lab.
C. R. Lee, R. E. Hoeppel, P. G. Hunt, and C. A. Carlson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 336 Price codes: A05 in paper copy, A01 in microfiche. Final Report No. WES-TR-D-76-4, June 1976. 86 p, 12 fig, 9 tab, 137 ref, 5 append.

Descriptors: *Vegetation, *Vegetation establishments, *Waste dumps, *Waste treatment, Spoil banks, Contaminants, Slurries, Filtering, Dredging material, Heavy metals, Lead, Mercury, Zinc, Nitrogen, Phosphorus, Cadmium, Feasibility, Literature, Water quality, Environmental effects.

Information compiled from a literature review and field observations was examined to determine the feasibility of using vegetation to filter, dewater and remove contaminants from dredged material slurry and effluent from confined disposal areas. Dredged material and potential vegetative colonizers from freshwater, brackish, and saline environments were considered in six U.S. geographical areas. Natural vegetation inside the disposal sites and the surrounding vacinities were identified, and a summary was compiled to provide a listing of plants for potential propagation on disposal sites. Conclusions resulting from the study include: the quality of discharge water from contaminated areas would be improved by the physical and chemical interactions of the vegetation with the dredged slurry; significant amounts of nitrogen and phosphorus could be removed from discharge waters by utilizing selected vegetation; feasibility is limited in the use of selected vegetation to remove heavy metal pollutants from dredged material; use of vegetation should be restricted if dredged sedi contain high levels of mercury, lead, or cadmium, as contamination by these elements precludes the use of the area as wildlife habitats; use of vegetation to dewater and consolidate fine textured dredged material is feasible; native plant species should be used if possible; the practicality of establishing and using vegetation will depend on the projected use of the area or the dredged material contaned therein. It is recommended that natural vegetation within a site be left intact, and the potential for contamination of the food chain by concentrations of the contaminants be evaluated. (Davison-IPA)

BASELINE REPORT OF ENVIRONMENTAL CONDITIONS IN DEEPWATER DUMPSITE 106. VOL I: PHYSICAL CHARACTERISTICS.
National Ocean Survey, Rockville, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 578, Price codes: A11 in paper copy, A01 in microfiche. NOAA Dumpsite Evaluation Report 77-1, June 1977. 232 p.

Descriptors: *Continental shelf, *Waste disposal, *Industrial wastes, *Environmental effects, Baseline studies, Climate, Delaware, New York, Water quality control, *Outer Continental Shelf, *Ocean dumping, New York Bight, Physical oceanography.

The results of field studies conducted by NOAA in and about the Deepwater Dumpsite 106 (DWD-106), approximately 106 nautical miles from Ambrose Lightship and 90 nautical miles due east of Cape Henlopen, Delaware, are given in this baseline report, for the purpose of characterizing the site's environment and biota. The Baseline Report is divided into three sections: Physical Characteristics which appear as volume 1, Biological Characteristics, volume 2, and Contaminant Inputs and Chemical Characteristics, volume 3. An Appendix, containing results too detailed for the main body of the report is included in volume 3. Characterization results are chiefly from three baseline cruises, but also from data obtained during two summer 1976 experimental cruises, as well as from National Marine Fisheries Service sources. This volume contains the following studies: Deepwater Dumpsite 106, bathymetry and bottom morphology; Six dives to the lower continental slope and upper continental rise southwest of Hudson Canyon - geological aspects; General physical oceanography of Deepwater Dumpsite 106; Physical Oceanography of Deep Deepwater Dumpsite 106, update - July 1975; Physical oceanography of Deepwater Dumpsite, February - March 1976; and Climatic study of New York Bight. (See also W79-02623) (Sinha-OEIS)

National Ocean Survey, Rockville, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 579, Price codes: A12 in paper copy, A01 in microfiche. NOAA Dumpsite Evaluation Report 77-1, June 1977. 271 p.

Descriptors: *Continental Shelf, *Waste disposal, *Industrial wastes, *Environmental effects, Baseline studies, Aquatic animals, Aquatic plants, Ecology, Water quality control, New York, Delaware, *Outer Continental Shelf, *Ocean dumping, New York Bight, Biological oceanography.

Biological data obtained on the baseline cruises provided limited quantitative coverage of the region. Together with other available data, this also sufficed to provide a qualitative biological overview of the region. A complete picture is not yet available and distinguishing dumping effects from natural variations will continue to be a problem. This volume contains the following studies: Phytoplankton in the vicinity of Deepwater Dumpsite 106; Deepwater Dumpsite 106 - Zooplankton studies; Gelatinous zooplankton at Deepwater Dumpsite 106; Apex predators in DWD 106; Distribution and abundance of mesopelagic fishes on cruises 2 and 3 at DWD 106; Observations from DSRV ALVIN on populations of benthic fishes and selected larger invertebrates in and near DWD-106; Epibenthic invertebrates; Epifaunal megabenthos in DWD 106; Final report on benthic infauna of DWD 106 and adjacent areas; and Neuston fish at DWD-106. A HIGH-EFFICIENCY THERMAL DRYING SYSTEM,
V. Maffet.
In: Proceedings of the First International Symposium on Drying, August 3-5, 1978, McGill University, Montreal, Canada, Science Press, Princeton, p 147-151. 2 fig.

Descriptors: *Sludge treatment, *Dewatering, *Drying, *Dryers, Wastes, Sludge, Air pollution control, Venturi scrubbers, Electrostatic precipitators, Turbulent-Contact absorbers, Solid wastes, Water pollution sources.

The system described is a toroidal dryer suitable for the dewatering of effluent sludges and similar waste materials, and also of heat-sensitive goods, with minimum damage. Air-pollution control equipment for installation on such a drying system is also discussed, including venturi scrubber, electrostatic precipitator, and turbulent-contact absorber. (Brown-IPC)

HAZARDOUS WASTE DISPOSAL DAMAGE REPORTS, DOCUMENT NO. 3.
Environmental Protection Agency, Washington, DC. Office of Solid Waste Management Programs
Available from the National Technical Information

Service, Springfield, VA 22161 as PB-261 156, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA/530/SW-151.3, June 1976. 20 p, 5 ref.

Descriptors: Publications, *Environmental effects, *Public health, *Waste disposal, Contaminants, Aquifers, Landfills, Cattle, Petrochemicals, Pollutant identification, Poisons, Industrial wastes, Sodium compounds, Soil contamination, Water pollution, Air pollution, Economics, Legal aspects, Solid Wastes Disposal Act, New Jersey, Louisiana, Maryland, Water pollution effects.

Three incidents of improper land disposal of hazardous wastes are documented as part of an investigation to determine the impact of such practices on public health and on the environment. The incidents reported are : (1) petrochemical contamination of the Cohansey Aquifer in New Jersey caused by the dumping of drums of liquid chemical wastes between August and September 1971; (2) hexachlorobenzene contamination of cattle in Louisiana discovered in December 1972; and (3) poison fumes resulting from a chemical reaction of industrial waste pollution at a Maryland landfill, causing six men to be hospitalized. (Davison-IPA)

DISPOSAL OF DILUTE PESTICIDE SOLUTIONS,
Environmental Protection Agency, Cincinnati, OH. Office of Solid Waste Management.
H. R. Day.
Available from the National Technical Service, Springfield, VA 22161 as PB-261 160, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA/530/SW-519, June 1976. 22 p, 1 tab, 18 ref.

Descriptors: *Pesticide disposal, *Waste disposal, *Ultimate disposal, Dilution, Waste treatment, Waste dumps, Waste storage, Lagooning, Incineration, Biodegradation, Chemical degradation, Filtration, Photodecomposition, Soil disposal fields, Soil bacteria, Regulations, Costs.

A compilation of current information on the disposal of excess dilute pesticide solutions is presented. These solutions include unused spray, container rinsate, equipment washings, and spill clean-ups which are equal to or less than the recommended application concentration. Current disposal practices include: use as a dilutant for spray mixtures; holding tanks, disposal pits, and dry wells; soil injection; chemical detoxification; incineration; photodecomposition; batch biodegredation; and special land disposal sites designed to avoid groundwater contamination. It is believed that use as a dilutent for spray mixtures is the most reliable and desirable disposal method, but the choice of method depends on the nature of the pesticide, its concentration, local disposal costs, and destruction assurance. A summary of the Federal regulatory efforts regarding pesticide disposal, and current research on disposal methods is given. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 864, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA/530/SW-112C, December 1975. 103 p, 18 tab, 91 ref, 4 append. 68-01-2956.

Descriptors: *Pesticide disposal, *Chemical degradation, *Landfills, *Decontamination solution, Alkali treatment, Personal protection, Disposal methods, Phosphorus compounds, Nitrogen compounds, Chlorine compounds, Diazinon, Toxicity, Pesticides, Water pollution, Neutralization.

An in-depth investigation of twenty key pesticides, representative of the major pesticide classes, was conducted to develop procedures advising pesticide users of safe, readily available chemical methods for pesticide disposal. Selection, based on production volume and toxicity, included the suitability of a pesticide's chemical structure in representing the chemical class, persistence in the soil, mobility and solubility in water. A literature review and information provided by pesticide manufacturers determined that alkali treatment is an effective environmentally safe method for disposal of naled, diazinon, Guthion, malathion, carbaryl, captan, and atrazine. No practical chemical degradation/detoxification methods were indicated for disposal of Dursban, methyl parathion, maneb, alachlor (Lasso), diuron, picloram, trifluralin, methoxychlor, chlordane, toxaphene, 2,4-D, amiben (chloramben), and pentachlorophenol. The recommended procedure for pesticide disposal is discussed in terms of personal protection, chemical detoxification by alkali treatment, pesticide container decontamination procedure, and alternate methods for disposing of small quantities of selected pesticides. An extensive list of references is included. (Davison-IPA)

WASTE DISPOSAL STUDY, EVALUATION OF METHODS TO RECOVER REUSABLE CHEMICALS FROM EVAPORATED PHOTOWASTES,
Computerized Pollution Abatement Corp., Leicester, NY. Pollution Abatement Div.
G. A. Lorenzo, and T. N. Hendrickson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A031 767, Price codes: A04 in paper copy, A01 in microfiche. Final Report No. AFAL-TR-76-75, September 1976. 60 p, 10 fig, 12 tab, 6 append. F33615-74-C-1091.

Descriptors: *Photography wastes, *Waste water treatment, *Recycling, *Chemical wastes, Waste reclamation, Sodium compounds, Sulfur compounds, Sulfite liquors, Sewage treatment, Industrial wastes, Evaporation, Sulfonates.

The feasibility of recovering certain chemicals for reuse from evaporated photoprocessed wastes was investigated. Priority consideration was given to the reclamation of all or part of the chemical waste rendering it suitable for use by a part of the industry able to absorb all of these chemicals. Other factors included the conversion of all or a portion of the wastes into: (1) insoluble materials of construction; (2) harmless gases for release into the atmosphere; and/or (3) a form acceptable to conventional sewage treatment plants. It is concluded that sodium thiosulfate and sodium sulfite can be reclaimed for evaporated photographic wastes, with a recovery of 35% to 90% for sodium thiosulfate and 10% to 60% for sodium sulfite. Recovery of the developers, such as hydroquinone and elon, is economically impractical because they are present in low concentrations. Converson of sulfonated developers to recyclable quinone can be accomplished in low yields. Acetic acid or sodium acetate can be reclaimed by conversion to butyl acetate followed by distillation. Baron, phosphorus, silver, iron, and cadmium, present in small amounts, are not practical to recover. The reclamation procedure for thiosulfate and sulfite is cost effective. Best recovery efficiencies are realized when sodium thiosulfate concentrations is more than 50% of the total waste. (Davison-IPA)

D. B. Cohen, and D. N. Bryant.
Canada-Ontario Agreement on Great Lakes Water Quality, Research Report No. 79, 128 p, 43 fig, 53 ref, 35 tab. 72-3-6.

Descriptors: *Sewage sludge, *Chemicals, *Sewage disposal, *Lysimeters, Model studies, Leachate, Leaching, Heavy metals, Crops, Nutrient analysis, Sludge digestion, Iron, Lime, Canada, *Alum, *Ontario sludge disposal survey(1975), University of Guelph.

Lysimeter experiments in which crops were grown on agricultural soils treated with anaerobically digested sewage sludges (from plants where phosphorus removal was being practiced using metal salts) were initiated in 1972 and 1973. Alum, iron and lime treated fluid sludges were added to loamy sand and silt loam soils vegetated with orchard grass. Similarly, alum, iron and lime treated air-dried sludges were added to sand and clay soils and wheat crops were grown. The high application rates of fluid and air-dried sludges ranged from 32 to 76 and 47 to 144 tons dry wt per ha per yr, respectively. The metal loadings approximated the recommended maxima for Ontario agricultural land. The lower rates were one-third and two-thirds of the high rates. The results of these experiments are presented and compared to results from field and greenhouse studies. (WATDOC)

EVALUATION OF THE WYOMING WATER SUPPLY PROGRAM.
Environmental Protection Agency, Denver, CO. Air and Water Programs Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 579, Price codes: A11 in paper copy, A01 in microfiche. December 1972. 250 p, 9 fig, 12 tab, 10 ref, 13 append.

Descriptors: *Water quality control, *Wyoming, *Water quality evaluation, *Water supply, Potable water, Chemical analysis, Public health, Water pollution treatment, Chlorination, Legislation, Bacteria, Aquatic bacteria, Manpower, Budgeting, Surveys, Chemical properties, Manpower, Budgeting

Results of in-depth studies of 23 public, 13 semi-public, and 127 individual supplies in Campbell, Lincoln, and Natrona Counties, Wyoming, are presented. Of the 23 public water supplies studied: 9% failed to meet manditory chemical drinking water limits; 35% failed to meet recommended chemical drinking water standards; 70% needed additional treatment facilities; 96% were not providing adequate disinfection (chlorination); and 96% had operators with little or no training in water treatment or systems. Semi-public and individual water supplies showed similar results. The adequacy of Wyoming's Water Supply Program was evaluated on the basis of surveillance activities, laboratory resources, policies, legislation, budget, and manpower. Indications are that funds and man-years available are inadequate to support the program effectively. Ten specific recommendations needed for Wyoming to have an effective and responsive Water Supply Program are presented. (Gibson-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 390, Price codes: A03 in paper copy, A01 in microfiche. M.S. Thesis, 1978. 22 p, 2 tab, 5 fig, 7 ref. OWRT A-063-CONN(1), 14-31-0001-5007.

Descriptors: *Electrochemistry, *Heavy metals, *Water purification, *Corrosion control, Aluminum, Zinc, *Removal efficiency, *Metallic impurities, Deposition products, Fluidization, Economic viability, Magnesium bed.

The use of metallic replacement reactions for noble metallic ion control was shown to be a realistic prospect. Static granular zinc beds were ideally efficient in removing the noble metal ions Hg (+2), Cu (+2), Pb (+2) which are a major source of corrosion in aluminum flow systems. Magnesium beds were effective in replacing the less noble ions Co (+2), Cd (+2), Cr (+2), Ni (+2). They also, however, suffer rapid corrosion limiting their economic viability. Aluminum was found to be essentially inert. Since aluminum and zinc form more protective coatings, it may be found that an Mg-Zn or Mg-Al alloy will corrode less rapidly while still being reactive to less noble ions. The effects of time on the process efficiencies were found to reflect the changing physical characteristics of static beds. Evidence suggested blockage of the bed by the deposition products effectively reduced the apparent size of the bed. Fluidization of the active metal dramatically improved the time characteristics of the removal efficiency while still maintaining a high electrochemical efficiency. (deLare-Conn)

5G. Water Quality Control

EVALUATION OF MEASURES FOR CONTROLLING SEDIMENT AND NUTRIENT LOSSES FROM IRRIGATED AREAS,
Idaho Agricultural Experiment Station, Moscow
D. W. Fitzsimmons, C. E. Brockway, J. R. Busch, L. R. Conklin, and R. B. Long.
Publication No. EPA-600/2-78-138, July, 1978. 150 p, 51 fig, 82 tab, 59 ref.

Descriptors: Irrigation, Soil conservation, Water quality, *Salinity, Economic analysis, Management, *Nutrients, *Sediments, *Return flow.

Field studies were conducted in two southern Idaho areas to determine the effects of different management practices on the quality and quantity of the runoff from surface-irrigated fields. Pollutant removal systems (primarily mini-basins, vegetated buffer strips and sediment retention ponds) were installed at some of the study sites and evaluated to determine their effectiveness in removing sediment and other materials from return flows. The results indicate that water, sediment and nutrient losses from surface-irrigated areas can be greatly reduced or eliminated by the use of certain types of management practices and/or pollutant removal systems. Linear programming models were used to determine the economic impacts of using different types of practices to control surface runoff and sediment losses from model farms. The results indicate that sediment losses from surface-irrigated fields can be reduced by as much as 50 percent at modest cost. Elimination of surface runoff and sediment losses would require the use of sprinkler irrigation systems and would decrease net income by about 15 percent. Some of the overall impacts of pollutant losses from surface-irrigated areas were evaluated. The annual cost of removing sediment from canals and ditches in the Boise Valley was found to be about $20 per hectare. Irrigation return flows contribute to water quality problems in the Boise River and downstream in the Snake River. (Skogerboe-Colorado State)

FEDERAL GUIDELINES: INDUSTRIAL COST RECOVERY SYSTEMS, MUNICIPAL WASTEWATER TREATMENT WORKS CONSTRUCTION GRANTS PROGRAM.
Environmental Protection Agency, Washington, DC. Office of Water Program Operations
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 651, Price codes: A03 in paper copy, A01 in microfiche. Report No. MCD-45, February 1976. 31 p, 3 tab, 2 append.

Descriptors: *Waste water treatment, *Federal Water Pollution Control Act, *Cost repayment, Cost analysis, Cost allocation, Federal project policy, Grants, Municipal wastes, Construction grants, Treatment facilities

The Federal Water Pollution Control Act Amendments of 1972 extended the construction grants program and imposed new requirements on grant applicants necessitating guidelines for industrial cost recovery (ICR). General requirements for step 2 (preparation of construction drawings and specifications) and step 3 (fabrication and building of a treatment works) grant applications are summarized, and the required documentation for step 3 grant approval is discussed. Other areas covered include: appeal procedure; computation of ICR payments; reserved capacity; exclusions from application of ICR system; ICR examples; new industry; monitoring; discontinuance of use by industrial user; lump sum ICR payments; state agency reviews; conflicts between local laws and Federal ICR requirements; and implementation of approved ICR systems. It is noted that the appendicies are intended as part of these guidelines and should be used as such. (Davison-IPA)

FINANCIAL IMPLICATIONS OF WASTE MANAGEMENT SYSTEMS FOR SHELLFISH PROCESSING,
Georgia Univ., Athens.
R. M. North, and F. M. Lyda.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 742, Price codes: A02 in paper copy, A01 in microfiche. Report No. NOAA-76042112, December 1975. 8 p, 4 tab, 6 ref. Reprinted from Journal of Agricultural Economics, December 1975. SG-04-3-158-6.

Descriptors: *Shellfish, *Industrial wastes, *Waste water treatment, *Cost analysis, Shrimp, Economic analysis, Capital costs, Maintenance costs, Operating costs, Replacement costs, Effluents, Biological oxygen demand, Food processing industry, Treatment facilities.

The problems encountered by the shellfish processing industry in its effort to meet the rising costs of maintaining low pollution standards are discussed. Emphasis is on demonstrating the cash flow basis implications of private construction of waste water treatment facilities for processing firms with regard to their present technological state in waste water treatment, expected effluent standards, residuals recycling, and capital markets. Although various altenatives are available for firms facing compliance with Federal or state effluent standards, it is recommended that consideration be given to initial capital outlay, operation, maintenance and replacement charges, depreciation, tax advantages and methods of financing. It is concluded that the most important of these factors is the expected cash flow of an in-plant treatment system relative to the alternative of municipal treatment expenditures. Each firm must weigh the risks of escalating municipal charges against rising construction, operating maintenance, and replacement costs, and the firm's ability for effective management of the treatment system regarding effluent standards. (Davison-IPA)

UPGRADING DIARY PRODUCTION FACILITIES TO CONTROL POLLUTION -- IN-PLANT CONTROL OF WASTE,
Cornell Univ., Ithaca, NY. DePt. of Food Science.
R. R. Zall, and W. K. Jordan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 815, Price codes: A05 in paper copy, A01 in microfiche. Presented at the Environmental Protection Agency Technology Transfer Design Seminar, Madison, WI, March 1973. 82 p, 21 fig, 9 tab, 73 ref, 1 append.

Descriptors: *Dairy industry, *Waste dilution, *Pollution abatement, Detergents, Biological oxygen demand, Equipment, Industrial wastes, Industrial production, Management, Operations, Milk, Milk products, Instrumentation, Agricultural wastes, Monitoring, Water reuse, Waste treatment, Cost analysis, Economic efficiency, Profit, Separation techniques, Monitoring.

The relationship between selected food plant problems and in-plant control of waste and pollution is discussed. In a case study, a New York State dairy plant was subjected to measures emphasizing in-plant actions to minimize waste production, and waste volume was reduced by 50%. Waste reduction involves all in-plant production phases, and personnel education and reeducation. Other measures contributing to waste reduction include partial segregation of the rinsings from lines and equipment, reuse of some detergents and the determination of inefficient areas of plant operation through the use of temperature recorders, conductivity scanners, and weir measuring devices. It is concluded that a new source of revenue can be produced through reduction in waste handling costs and in-plant savings of raw material. (See also W79-02519) (Davison-IPA)

UPGRADING DAIRY PRODUCTION TO REDUCE POLLUTION -- CHOOSING THE OPTIMUM FINANCIAL STRATEGY FOR POLLUTION CONTROL,
Commins (J. A.) and Associates, Inc., Fort Washington, PA.
U. M. Patankar, and C. R. Marshall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 816, Price codes: A04 in paper copy, A01 in microfiche. Presented at the Environmental Protection Agency Technology Transfer Seminar, Madison, WI, March 20-21, 1973. 70 p, 10 fig, 6 tab.

Descriptors: *Dairy industry, *Water pollution abatement, *Cost-benefit analysis, Tax rates, Government finance, Legal aspect, Legislation, Federal Water Pollution Control Act, Water pollution control, Financing, Sewage treatment, Industrial waste treatment, Cost analysis, Municipalities, Technology transfer, Water pollution, Agricultural wastes, Investment, Depreciation.

Tax and financing strategies for dairy processing firms to economically finance pollution control equipment are discussed. A method is also presented for financially analyzing whether dairy processors should, when the choice is available, use on-site treatment or send pretreated wastes to a municipal system. It is pointed out that pollution control equipment costs are exempt from certain sales, use and property taxes through tax-exempt financing or adjustment in company income taxes by the addition of special depreciation alternatives. Other incentives include the possibility of government treatment of wastes at lower costs than self-treatment through Federal Government grant programs. To aid companies in making sound management decisions related to pollution control expenditures: standard depreciation for pollution control facilities are discussed; the costs of different methods of financing pollution control equipment are examined; financing and tax strategies for equipment are related to company financial strategies; and the availability of the various financing alternatives from the Federal government and from five mid-western states in which the greatest amount of dairy processing takes place are surveyed. (See also W79-02518) (Davison-IPA)
W79-02519

INTRODUCTION TO THE MODEL STATE INFORMATION SYSTEM (MSIS).
American Management Systems, Inc., Arlington, VA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 863, Price codes; A03 in paper copy, A01 in microfiche. Final Report No. EPA-570/9-76-002-4, June 15, 1976. 33 p, 9 fig, 9 tab. 68-01-1968.

Descriptors: *Water quality control, *Model State Information System, *Monitoring, *Computer programs, Safe Drinking Water Act, Data collections, Data transmission, Drinking water, Legislation, Reporting, State jurisdiction, Water quality, Standards, Law enforcement, Water supply, Potable water, Documentation, Regulations.

The Model State Information System (MSIS), a computer-based information system, is designed for states which do not have an automated system for managing the water quality data required by the National Interim Primary Drinking Water Regulations. The states will have the option of choosing the basic package consisting of the Public Water Supply Inventory subsystem, Water Quality Compliance subsystem, Regulations subsystem, and Federal Reporting subsystem, plus one or more optional features. The optional features are: variances and exemptions subsystem, enforcement action subsystem, sanitary survey subsystem, and operator and mailing subsystem. The MSIS will reduce the states' administrative costs in implementing the regulations through computer-based techniques. Costs of software development training and installation will be reduced by the EPA developed system rather than a custom built system. Each of the elements of the water quality compliance subsystem is summarized, key reports are tabulated, and a schematic diagram of its function is provided. The MSIS process sequence is discussed from preparation of the operational environment through its entire production including the optional features. A sample operating schedule is provided. (See also W79-02521) (Davison-IPA)
W79-02520

'BEST MANAGEMENT PRACTICES' FOR SALINITY CONTROL IN GRAND VALLEY,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
W. R. Walker, G. V. Skogerboe, and R. G. Evans.
Publication No. EPA-600/2-78-162 July, 1978. 113 p, 21 fig, 11 tab, 46 ref.

Descriptors: Irrigation, Fluid infiltration, *Salinity control, Seepage, Water distribution, Water loss, Water pollution, *Water quality control, Sprinkler irrigation, *Colorado, *Grand Valley(Colo), *Return flow.

A nontechnical summary of several research activities in the Grand Valley is given. Analyses of alternative measures of reducing the salt load originating from the Valley as a result of irrigation return flows are presented. These alternatives include conveyance channel linings, field relief drainage, on-farm improvements (such as irrigation scheduling, head ditch linings, sprinkler and trickle irrigation), economic control measures such as taxation and land retirement, modified legal constraints, and collection and treatment of return flows with desalting systems. The best management practices for salinity control in the Grand Valley should be primarily the structural rehabilitation and operational modification of the local irrigation system lying below the turnouts from the major canal systems. Canal linings appear in the optimal strategies at higher levels of valley-wide salinity control emphasis but only so far as lining the Government Highline Canal is concerned. Desalting would become a cost-effective alternative after major irrigation system improvements are implemented. (Skogerboe-Colorado State)

SOME IMPACTS OF SAFE DRINKING WATER STANDARDS ON RURAL WATER SYSTEMS,
Mississippi State Univ., Mississippi State. Div. of Business Research.
L. R. Cheatham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 370, Price codes: A06 in paper copy, A01 in microfiche. Mississippi State University Report 1978, 99 p, 26 tab, 24 ref. OWRT A-111-MISS(1), 14-34-0001-8026.

Descriptors: *Water quality standards, *Water works, *Water costs, *Water treatment, *Treatment facility, *Water law, *Water quality control, *Public utilities, Water demand, Water delivery, Water management, Water pollution sources, Groundwater pollution, Coliform, Disinfection, Filtration, Chlorination, *Potable water, *Mississippi, *Small rural water systems, Water associations, Financial position data, *Drinking water regulations, Treatment costs, Monitoring costs,

Compliance costs, Economies of scale, Customer rates.

Timetable for compliance with National Interim Primary Drinking Water Regulations is such that violation notices sent to systems have thus far been limited to those for bacteria MCLs. In Mississippi this is expected to be the only standard of significant impact. Usage of treatment equipment by systems serving populations of less than 1000 is very limited. Large-percentages of these systems will have to purchase new disinfection equipment to reduce coliform content to the acceptable MCL. Greatest frequency of violations has occurred among the smallest systems. Compliance costs per customer will be greatest among the smaller systems because of high fixed costs of remedies with costs per customer declining as number of customers increase. Projected customer rate increased to compensate for high compliance costs for some small systems are higher than most customers are willing to accept for water quality improvements. Cost increases could result in some systems ceasing operations. In rural areas where customers have an alternative of switching to family wells if system rates become expensive, total revenues may decline because of loss of customers. If small privately owned systems are unable to pass cost increases along to customers, some owners will experience operating losses.

EMERGENCY SUSPENSION PROCEDURES FOR OUTER CONTINENTAL SHELF OIL AND GAS OPERATIONS,
Geological Survey, Washington, DC.
Federal Register, Vol. 42, No. 192, p 53956-59, October 4, 1977.

Descriptors: *Continental shelf, *Oil pollution, *Oil spills, *Regulation, Oil industry, Leases, Legal aspects, Water law, Oily water, Water pollution sources, Adoption of practices, Administration.

Promulgated in September, 1977, this federal Department of the Interior rule applies to all Outer Continental Shelf (OCS) oil and gas leases issued after publication. The rule supplements existing OCS oil and gas operations suspension procedures by specifying study methods of threats of significant irreparable damages, designating the procedure for establishing mitigation measures, and redefining property rights granted with a lease. If adequate mitigating measures cannot be designed, the Secretary of the Interior may, in specified circumstances, terminate an emergency suspension and allow a lease term to run without renewal of operations. Termination of suspension does not imply approval of operations on the lease. Although lessees will conduct and bear the cost of necessary studies, the Supervisor's approval of study plans should protect federal interests. While the Department of the Interior has no authority to exercise the power of eminent domain and pay compensation therefore on the OCS, the Department does not 'take' property rights in the constitutional sense when it exercises rights reserved when a lease was issued. Rights previously granted are not subject to taking without legislation. (Rule-Florida)

MINERAL MINING AND PROCESSING POINT SOURCE CATEGORY EFFLUENT GUIDELINES AND STANDARDS: PHOSPHATE ROCK MINING,
Federal Register, Vol. 43, No. 48, p 9808-10, March 10, 1978.

Descriptors: *Standards, *Phosphates, *Pollution abatement, *Industrial wastes, Mining, Mineral industry, Navigable waters, Federal water pollution control act, Regulation, Permits, Fluorides, Effluents.

These source performance standards limit the discharge of pollutants into navigable waters from phosphate rock mining and processing operations that are determined to be new sources. This is in compliance with requirements of the Federal Water Pollution Control Act. The standards are to be incorporated in National Pollutant Discharge Elimination System permits issued to new sources by the federal Environmental Protection Agency (EPA) or by states with EPA approved programs. These regulations apply to any applicable operation, the construction of which is commenced after the publication of proposed new EPA regulations. The effect of these regulations will be to require treatment of waste water discharged from new source phosphate mining and processing operations in the mineral mining industry. The regulations establish new source performance standards for total suspended solids and pH. The regulations call for the use of best available demonstrated control technology for controlling the discharge of process-generated waste water pollutants. The limitations for the phosphate mining and processing subcategory are applied on a concentration basis rather than a mass basis. Additional waste water pollutants which are controlled are radiological parameters, fluoride and phosphates. (Quarles-Florida)

LEGISLATION AND REGULATION: WHAT'S NEW WITH PL 92-500,
C. W. Heckroth.
Water and Wastes Engineering, Vol. 15, No. 1, p 17-32, 1978.

Descriptors: *Legislation, *Water quality act, *Waste water treatment, *Evaluation, Water quality, Chlorination, Technology, Grants, Waste water(Pollution), Toxins, Oil spills, Disinfection.

Congress has finally passed the compromise measure known as the 1977 Clean Water Act and which is now ready for President Carter's signature. This article delves into all aspects of this compromise measure. The new changes contain more flexibility than previous measures. Although everyone is not happy with the compromise, it appears that most people are. The article examines the numerous changes made to the law in detail. The new measures are seen as more practical than the old requirements. Some environmentalists are unhappy because some delays are inherent in the law. However, the basic regulatory framework is intact. The major points of the new amendments are: (1) an extension of the compliance deadline for best practical technology standards in certain circumstances; (2) a one-year extension of the compliance deadline for best abailable technology; (3) regulation of some toxic chemicals and other pollutants; (4) allocation of almost $25 billion for five years of cleanup; and (5) authority to grant treatment facility grants. The article also discusses specially selected areas of the Act which have constantly revitalized ongoing programs. These include disinfection techniques, hazardous wastes and areawide water quality planning programs. (Quarles-Florida)

THE CLEAN WATER ACT OF 1977,
R. M. Hall, Jr.
Natural Resources Lawyer, Vol. 11, No. 2, p 343-72, 1978.

Descriptors: *Federal water pollution control act, *Legislation, *Planning, *Analysis, Construction, Grants, Technology, Toxins, Standards, Pollutants, Oil, Permits.

The 1977 Clean Water Act amends a number of significant aspects of the 1972 Federal Water Pollution Control Act Amendments. This article reviews and analyzes the major features of these new amendments. The 1977 amendments reflect extensive fine tuning of a complex statute. During the five years since the 1972 amendments were passed, the Environmental Protection Agency and the courts have been grappling with implementation problems. These arise from both practical difficulties and statuory ambiguity. The 1977 amendments ease many of these problems. The new amendments also impose additional responsibilities on various government agencies which have the duty of implementation. The legislation also imposes new requirements on industries and others who must comply with the Act. Additional burdens are placed upon the nation's taxpayers who must bear the ultimate financial burden of cleaning up the nation's waters. The author suggests that the new amendments will raise new problems of statutory interpretation. The article includes background on the 1972 amendments' effect, as well as the legislative history of the 1977 amendments. (Quarles-Florida)

THE WATER QUALITY IMPROVEMENT ACT OF 1970, THE 1972 AMENDMENTS AND STATE ANTIPOLLUTION LAWS,
D. R. Villareal, Jr.
The Forum, Vol. 13, No. 2, p 438-51, Winter 1978.

Descriptors: *Water quality act, *Oil spills, *Remedies, *Penalties(Legal), Legislation, Legal aspects, Water law, State jurisdiction, Federal jurisdiction, Statutes, Regulation, Water pollution.

Under the 1970 Water Quality Improvement Act and the Act's 1972 amendments, the person in charge of an offshore or onshore facility or a vessel, has a duty of reporting any discharge of oil in harmful quantities into or upon the navigable waters of the United States, adjoining shore lines, or waters of the contiguous zone. The U.S. Coast Guard has been designated as the appropriate agency to report to. However, there may also be a duty to report to a state authority. While the President is authorized to remove spilled oil--unless he determines that it will be done properly by those responsible for it--there is no mandate in the Act that the spilled oil be cleaned up. If the President orders the oil removed, removal costs are recoverable from the spiller. There are criminal sanctions for violations of the Acts, in addition to sanctions still in effect under the 1899 Refuse Act. Civil penalties and damage liability may also be assessed. Because Puerto Rico and the 22 coastal states have also enacted reporting, cleanup and damages statutes, there is some overlap of federal and state legislation. (Rule-Florida)

BANNING DETERGENT PHOSPHATES - THE DEBATE CONTINUES,
S. J. Hadeed.
Journal of the Water Pollution Control Federation, Vol 50, No 2 p 190-92, 1978.

Descriptors: *Great Lakes region, *Eutrophication, *Phosphates, *Detergent, Great Lakes, Phosphorus, Nutrients, Nutrient removal, Municipal wastes, Canada, Waste water treatment, Water chemistry.

The release of a paper prepared by the federal Environmental Protection Agency (EPA) Region V Phosphate Committee titled 'Detergent Phosphates Ban' has re-ignited the old controversy over banning detergent phosphates. The paper recognizes that phosphorus is the primary nutrient responsible for lake eutrophication and advocates that states in the Great Lakes Basin adopt a ban on phosphorus in detergents. Phosphorus has been identified as the cause of advanced eutrophication in the Great Lakes. The detergent industry has reacted strongly in opposition to such a ban, contending such a restriction alone will not relieve the Great Lakes region of its eutrophication problems. Past EPA policy is explained, including the United States-Canada agreement limiting phosphorus discharges by municipal treatment plants. The deter-

gent industry argues that the technology to remove phosphorus from wastewater is available, and a ban is not justifiable. The search for alternatives to phosphate detergents is explained, as well as the economic impact of a phosphate ban. The latest legislative maneuvering on the issue is revealed, and the conclusion reached that no major advances are in sight. (Quarles-Florida)

CONSUMER NOTIFICATION - PUBLIC AWARENESS OR THE SMOKING PISTOL,
California State Dept. of Health, Berkeley.
J. M. Gaston.
Journal of the American Water Works Association, Vol. 69, No. 11, p 574-76, 1977.

Descriptors: *Public utilities, *Administrative decisions, *Water quality control, *Potable water, Water supply, Water quality standards, Water quality, California, Public health, Administration, Regulation, Legislation.

The expressed purpose of the federal Safe Drinking Water Act is to assure that water-supply systems serving the public meet minimum national standards for protection of public health. The mandatory public notification provision contained in the Act has caused much consternation in the water-supply industry for utility members and regulatory agencies. No one is sure what to expect from consumers, state regulatory agencies or the federal Environmental Protection Agency (EPA). The article examines the activities of the California State Department of Health as they relate to the consumer notification requirements that presently exist. In this way, some of the problems and opportunities that lie in the future may be revealed. The two specific instances where the Department might require a utility to notify the public are: (1) when there is a water quality emergency resulting in a total system contamination; and (2) when the Department decides that public interest requires notification. The latter instance is the most controversial and may occur for various reasons. The author concludes that the EPA wishes to provide national policy and guidance and that utilities are expected to be responsible for providing clean water. (Quarles-Florida)
W79-02545

OVERVIEW OF FEDERAL GROUNDWATER PROTECTION LEGISLATION AIDS ENVIRONMENTALISTS,
Environmental Protection Agency, Washington, DC. Criteria and Standards Div.
R. K. Ballentine.
Water and Sewage Works, Vol. 125, No. 4, p 68-70, 1978.

Descriptors: *Groundwater, *Groundwater resources, *Legislation, *Federal water pollution control act, Federal government, Water management(Applied), Conservation, Water quality, Toxins, Administrative agencies, Evaluation, Water policy.

Federal statutes dealing with groundwater quality protection, even ones having peripheral impact, are discussed here in detail. The Safe Drinking Water Act, perhaps the law with the greatest impact in this area, is omitted from discussion. The statutes discussed are: (1) the 1972 Federal Water Pollution Control Act Amendments (FWPCA); (2) the Toxic Substances Control Act; (3) the 1976 Resource Conservation and Recovery Act; (4) the 1969 National Environmental Policy Act; and (5) two executive orders on the subject. Control of groundwater quality protection on federal lands and federal facilities is also discussed. The FWPCA requires waste-treatment management plans to include processes necessary to control groundwater quality. States are required to enforce any groundwater provision of any Section 208 agency. The federal Environmental Protection Agency (EPA) is required to issue guidelines for methods to control pollution resulting from the disposal of pollutants in subsurface excavation. The EPA may delegate to the states the power to issue permits controlling the disposal of pollutants into wells. The impact on groundwater protection by the other legislative acts is also discussed in detail. (Quarles-Florida)
W79-02546

NONDETERIORATION AND THE PROTECTION OF HIGH QUALITY WATERS UNDER FEDERAL WATER POLLUTION CONTROL LAW,
Utah Law Review, Vol. 1977, No. 4, p 737-57, 1977.

Descriptors: *Federal water pollution control act, *Degradation(Stream), *Water quality control, *Analysis, Water quality, Water quality standards, Legislation, Federal government, Regulation, Judicial decisions, Economics, Evaluation.

The policy of prevention of significant deterioration of high quality water, which arose from the 1972 Federal Water Pollution Control Act Amendments, has received scant attention. This may be a sign that the Federal Environmental Protection Agency (EPA) has satisfied all rival camps, or perhaps it indicates that the policy's potential has not been fully realized. This article explores the nondegradation policy of the Act and the legal foundation for its implementing regulations. The language used by the EPA in its implementing regulations is examined along with the adequacy of the protection afforded high quality waters by the regulations. The author concludes with suggested methods to protect high quality waters. The regulations preventing degradation are ambiguous and nonspecific, tending to result in weak enforcement. Furthermore, the EPA has vested much discretion in the states resulting in national irregularity. The author suggests quality waters. Adoption of the following is urged: (1) more clearly defined procedures for public participation; (2) intergovernmental input; (3) federal intervention; and (4) EPA review of policy decisions. WESTERN WATER LAWS AND IRRIGATION RETURN FLOW,
Resources Administration and Development, Inc., Fort Collins, CO.
G. E. Radosevich.
Publication No. EPA-600/2-78-180, August, 1978. 257 p, 5 fig, 3 tab, 107 ref, 1 append.

Descriptors: *Water law, *Water rights, Irrigation, Irrigated land, Water pollution, Water quality, *Return flow, Prior appropriation.

The impact of water law upon allocation and use of waters within the Western United States is currently recognized as one of the major constraints to adaptation by irrigated agriculture of more efficient operation practices. This project provides a background of the law and evaluation of the potentials through water law interpretations or changes to implementing improved water management technology. Specifically, this report provides a synthesis of water laws of each of the 17 western states, as well as providing a state-by-state account of the water quantity laws, paying particular attention to features in the laws and their administration that direct the manner of use and provide incentives or disincentives to more efficient use. General recommendations are offered that will permit or induce more efficient and effective water management. Specific recommendations identify areas requiring additional research to renovate state water laws consistent with present and prospective policies and needs. (Skogerboe-Colorado State)

Descriptors: *Potassium compounds, *Salts, *Manganese, *Fish hatcheries, Disinfection, Fish management, Fish parasites, Fish physiology, Fish diseases, Fungicides, Algicides, Piscicides, Rotenone, Antimycin A, Dissolved oxygen, Oxygen sag, Chemical analysis, Chemical properties, Aquiculture, Toxicity, *Bibliographies, *Potassium permanganate, *Permanganates.

Potassium permanganate is one of the most widely used inorganic chemicals in the world. Since its first use in fish culture in 1893, potassium permanganate has been used primarily as: (1) a disinfectant in fish hatcheries for aquatic plants, aquaria, raceways, ponds, and water supplies; (2) for removal of fish parasites; (3) to reduce disease, or as a disease preventative, especially on wounds of fish; (4) for detoxification of fish toxicants such as rotenone, and antimycin; (5) for fungus and algae control; and (6) temporary oxygen depletion problems in ponds. In foreign countries, potassium permanganate is used for removal of parasites before the live fish is sent to market, as well as a disinfectant. (EIS-Deal)

EVALUATION OF IRRIGATION METHODS FOR SALINITY CONTROL IN GRAND VALLEY,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. G. Evans, W. R. Walker, G. V. Skogerboe, and S. W. Smith.
Publication No. EPA-600/2-78-161, July, 1978. 172 p, 50 fig, 8 tab, 150 ref.

Descriptors: Irrigation, *Salinity control, Saline soils, *Water quality control, Water pollution, Water loss, *Colorado, *Grand Valley(Colo), *Return flow.

Irrigation return flows in the Upper Colorado River Basin carry large salt loads as a result of contact with the saline soils and the marine derived geologic substratum. The Grand Valley of Western Colorado is a major contributor to the salinity problems of the basin and is, therefore, a logical region to test the effectiveness of agricultural salinity control alternatives. This study emphasized the implementation of on-farm salinity control alterna-

tives; primarily evaluating irrigation scheduling, furrow irrigation, sprinkler irrigation, and trickle irrigation. Border irrigation was also evaluated, but was not implemented as part of this study. The cost-effectiveness of the various on-farm alternatives in the Grand Valley is summarized and presented in this report. (Skogerboe-Colorado State)

AVIAN COMMUNITIES AND HABITAT COMPONENTS IN NATURAL AND WASTEWATER-IRRIGATED ENVIRONMENTS,
Pennsylvania State Univ., University Park.
S. J. Lewis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 393, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, November, 1977. 143 p, 8 fig, 21 tab, 173 ref, append. OWRT B-084-PA(3), 14-34-0001-6113.

Descriptors: *Birds, *Waste water(Irrigation), *Pennsylvania, Habitats, Seasonal, *Avian population, *Spray irrigated, *Municipal sewage effluent, Arthropod, *Foliage height diversity, *Effluent spraying, Vegetative succession, Environmental conditions, Herbaceous vegetation, Red-winged Blackbird, Habitat changes.

Avian populations, guilds, and communities were monitored in old field (OF), aspen-pine-shrub (APS), and mixed oak (MO) habitats in Pennsylvania. Portions of the Study area had previously been spray-irrigated with municipal sewage effluent. The objectives of this study were to determine relationships between birds and selected habitat components (vegetative structure and arthropod abundance) and to evaluate how these changed with year, season, vegetative succession, and habitat treatment (wastewater irrigation). Within the successional gradient of the OF, APS, and MO areas, the following patterns were noted. As succession advanced, upper vegetative strata became more prominent and shading caused low vegetation to decline. Associated with the progressive loss of herbaceous vegetation was a decrease in the abundance of arthropods. Total vegetative cover increased with succession. Total breeding bird abundance declined with succession. Bird species diversity (BSD) increased with foliage height diversity. The abundances of bird species using specific vegetative strata for nesting and foraging were directly related to the quantity of foliage available in those strata. Although wastewater irrigation of APS and MO vegetation had ceased one and two years before this study, numerous habitat changes caused by the process were still evident. Avian community abundance, dominance, and evenness changed significantly with effluent spraying. (Sink-Penn State)

NEPA'S EFFECT ON THE CONSIDERATION OF ALTERNATIVES: A CRUCIAL TEST,
Stanford Univ., CA. Dept. of Civil Engineering.
W. W. Hill, and L. Ortolano.
Natural Resources Journal, Vol. 18, No. 2, p 285-311, April 1978. OWRT-C-4080(No 9017)(3), 14-31-0001-9017.

Descriptors: *Water resources planning, *Alternatives, Evaluation, *Water law, *Nonstructural alternatives, Soil Conservation Service, Army Corps of Engineers, National Environmental Policy Act, Council on ENvironmental quality, Environmental specialists, Interdisciplinary planning.

An examination was made of the National Environmental Policy Act's (NEPA) effects and effectiveness in two federal water resources planning programs: the small watershed program of the U.S. Department of Agriculture's Soil Conservation Service (SCS) and the survey investigation program (preauthorization studies) of the U.S. Army Corps of Engineers (Corps). Results from that portion of the research dealing with NEPA's influence on the formulation and evaluation of alternatives are presented. These results are based on data obtained from questionnaire surveys mailed in 1974 to all Corps District officers and SCS State officers. The data collected are used to conclude that the Corps and SCS planning studies underway in early 1974, NEPA had not greatly affected either the types of alternatives being considered or who and what influenced the formulation and evaluation of these alternatives.

A BIOLOGIST LOOKS AT OIL IN THE SEA,
Dalhouse Univ., Halifax (Nova Scotia). Dept. of Biology.
K. H. Mann.
Shore & Beach, Vol. 46, No. 4, p 27-29, October 1978.

Descriptors: *Oil spills, *Oil pollution, *Environmental effects, *Arctic, Water pollution effects, Baseline studies, Shores, Coasts, *Outer Continental Shelf, Petroleum development.

Nature is extremely variable and we have to survey the whole range of this natural variability before making comparison with a polluted situation. It is now known how much harm is done by an oil slick in the open sea, but when it comes ashore there is trouble in plenty. When oil comes ashore this highly productive area is damaged in differing degrees according to the type of oil and the type of community that lives there. The biological decomposition of oil and the recolonization process are both functions of the metabolism of marine organisms, and this is slower in colder waters. Hence, it is safe to say that the recovery period for oiled arctic shorelines would be well in excess of ten years. It has been shown repeatedly, that the number of species of plant and animal present, i.e. the species diversity, in an area after an oil spill is lower than that found in uncontaminated areas. For our knowledge of biological variability it is highly probable that information obtained about a species occurring in temperate waters is not applicable to the same, or a related species that may be living in the arctic environment. Food chains in Arctic waters are made up of rather few species, so that elimination of a key species could cause a major disruption in the productivity of species that serve as food for native peoples, and the dangers appear even more ominous. Considering the Arctic in particular, it does seem that the dangers of very serious impairment of the functioning of natural marine systems there are very real indeed. (Sinha-OEIS)

VULNERABILITY OF COASTAL ENVIRONMENTS TO OIL SPILL IMPACTS,
South Carolina Univ., Columbia.
E. R. Gundlach, and M. O. Hayes.
Marine Technology Society Journal, Vol. 12, No. 4, p 18-27, August-September 1978. 1 fig, 3 tab, 55 ref. NSF-ENV76-068-98-A02.

Descriptors: *Oil spills, *Coasts, *Water pollution effects, Resources development, Environmental effects, *Outer Continental Shelf, Vulnerability index, Residence time.

Contingency planning for potential oil spills is becoming a necessity for most of the coastal waterways of the United States. An important part of a usable contingency plan is the protection of those coastal environments most likely to be seriously damaged by oil contamination in the event of a spill. On the basis of field studies of five major oil spills and a review of the literature, major coastal environments have been classified on a scale of 1 to 10 in terms of potential vulnerability to oil spill damage. The scale emphasizes oil residence time, with consideration of initial biological impacts. Exposed rocky headlands and wave-cut platforms (1 and 2 on the Vulnerability Index) are generally lest affected by an oil spill. Coarse-grained sandy and gravel beaches, which are subject to oil penetration and burial, are assigned intermediate index values of 4 to 7. Sheltered environments such as sheltered rocky coasts, salt marshes, and mangroves (index values of 8 to 10) are the environments most likely to be adversely affected by oil spills. For example, residence times of over 10 years are predicted for some salt marsh areas. (Sinha-OEIS)
W79-02616

IMPLEMENTATION OF AGRICULTURAL SALINITY CONTROL TECHNOLOGY IN GRAND VALLEY,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. G. Evans, W. R. Walker, G. V. Skogerboe, and C. W. Binder.
Publication No. EPA-600/2-78-160, July, 1978. 193 p, 62 fig, 29 tab, 46 ref.

Descriptors: Irrigation, Ditches, Irrigation canals, *Salinity control, Saline soils, Salt water, Seepage, Water distribution, *Water quality control, Agricultural runoff, *Return flow.

A summary of the results of applied research on salinity control of irrigation return flows in the Grand Valley of Colorado is presented for the period of 1969 to 1976. Salinity and economic impacts are described for the Grand Valley Salinity Control Demonstration Project which contains approximately 1,600 hectares and involves most of the local irrigation companies in the Valley During the eight years of the demonstration project, 12.2 km of canals were lined, 26.54 km of laterals were lined, 16,400 meters of drainage tile were installed, a wide variety of on-farm improvements were constructed, and an irrigation scheduling program was implemented. On-farm improvements evaluated were solid-set sprinklers, side-roll sprinklers, drip (trickle) irrigation, furrow irrigation, and automatic cut-back furrow irrigation. The total value of the constructed improvements in the demonstration area was about $750,000. The total improvements resulted in a salt reduction of 12,300 metric tons per year reaching the Colorado River This salt reduction results in an annual benefit to downstream water users of nearly $2,000,000. In addition, there are benefits to the local water users with increased crop yields, and to the people of Grand Valley in increased business. (Skogerboe-Colorado State)

ALTERNATIVE POLICIES FOR CONTROLLING NONPOINT AGRICULTURAL SOURCES OF WATER POLLUTION,
Illinois Univ. at Urbana-Champaign.
W. D. Seitz, D. M. Gardner, S. K. Gove, K. L. Guntermann, and J. R. Karr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 757. Price codes: A14 in paper copy, A01 in microfiche Publication No EPA-600/5-78-005, April, 1978. 314 p, 22 fig, 55 tab, 168 ref, 8 append.

Descriptors: Water pollution sources, Soil erosion, Economics, *Alternative planning, Nonpoint pollution sources, Water pollution control, Agricultural runoff, *Return flow.

This study of policies for controlling water pollution from nonpoint agricultural sources includes a survey of existing state and Federal programs, agencies, and laws directed to the control of soil erosion. Six policies representing a variety of approaches to this pollution problem are analyzed. The aggregate economic impact of such policies is investigated using a state-of-the-art, market-equilibrium, linear-programming model of crop production in the corn belt. The economic effects of the policies at the level of individual forms and their

impacts on long-term soil productivity are analyzed through the use of a watershed model. The institutional arrangements needed to implement the policies are examined, as are the associated costs for a typical county. Literature on the social aspects of policy acceptance is reviewed, and the results of a survey of the reaction of farmers and ASCS directors in Illinois to different policies are presented. The equity of the policies is examined and legal precedents are reviewed. (Skogerboe-Colorado State)
W79-02619

INTEGRATING DESALINATION AND AGRICULTURAL SALINITY CONTROL ALTERNATIVES,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
W. R. Walker.
Publication No. EPA-600/2-78-074, April, 1978. 182 p, 30 fig, 17 tab, 55 ref, 2 append.

Descriptors: Cost effectiveness, *Desalination, Optimization, *Salinity control, Sprinkler irrigation, Water quality control, Alternative costs, *Return flow.

The cost-effectiveness relationships for various agricultural and desalination alternatives for controlling salinity in irrigation return flows are developed. Selection of optimal salinity management strategies on a river basin scale is described as a problem of integrating optimal strategies with individual subbasins and irrigated valleys. Desalination systems include seven processes: (1) multistage distillation; (2) vertical tube evaporation in conjunction with (1); (3) a vapor compression form of (2); (4) electrodialysis; (5) reverse osmosis; (6) vacuum freezing - vapor conveyance linings, irrigation scheduling, automation, sprinkler irrigation systems, and trickle irrigation systems. A case study of the Grand Valley in western Colorado is presented to demonstrate the analysis developed. Results indicate that treatments of the agricultural system are generally more cost-effective than desalting except for high levels of potential salinity control. Lateral linings and on-farm improvements are the best agricultural alternatives. (Skogerboe-Colorado State)

DISSOLVED-OXYGEN REGIMEN OF THE WILLAMETTE RIVER, OREGON, UNDER CONDITIONS OF BASINWIDE SECONDARY TREATMENT,
Geological Survey, Portland, OR. Water Resources Div.
W. G. Hines, S. W. McKenzie, D. A. Rickert, and F. A. Rinella.
Available from Distribution, USGS, 1200 S. Eads St., Arlington, VA 22202. Circular 715-I, 1977. 152 p, 30 fig, 10 tab, 32 ref.

Descriptors: *Water pollution control, *Pollution abatement, *Dissolved oxygen, *Monitoring, *Low-flow augmentation, Biochemical oxygen demand, Water treatment, Oregon, *Willamette River(Ore), Tertiary treatment.

For nearly half a century the Willamette River in Oregon experienced severe dissolved-oxygen problems related to large loads of organically rich waste waters from industries and municipalities. Since the mid-1950's dissolved oxygen quality has gradually improved owing to low-flow augmentation, the achievement of basinwide secondary treatment, and the use of other waste-management practices. As a result, summer dissolved-oxygen levels have increased, salmon runs have returned, and the overall effort is widely regarded as a singular water-quality success. To document the improved dissolved-oxygen regimen, the U.S. Geological Survey conducted intensive studies of the Willamette during the summer low-flow seasons of 1973 and 1974. During each summer the mean daily dissolved-oxygen levels were found to be higher than 5 milligrams per liter throughout the river. Because of the basinwide secondary treatment, carbonaceous deoxygenation rates were low. In addition, almost half of the biochemical oxygen demand entering the Willamette was from diffuse (nonpoint) sources rather than outfalls. These results indicated that point-source biochemical oxygen demand was no longer the primary cause of dissolved-oxygen depletion. Instead, the major causes of deoxygenation were nitrification in a shallow 'surface active' reach below Salem and an anomalous oxygen demand (believed to be primarily of benthal origin) in Portland Harbor. AN OILSPILL RISK ANALYSIS FOR THE MID-ATLANTIC (PROPOSED SALE 49) OUTER CONTINENTAL SHELF LEASE AREA,
Geological Survey, Reston, VA. Water Resources Div.
J. R. Slack, and T. Wyant.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 401, Price codes: A05 in paper copy, A01 in microfiche. Water-Resources Investigations 78-56, 1978. 72 p, 9 fig, 5 tab, 17 ref, append.

Descriptors: *Oil spills, *Hazards, *Probability, *Continental shelf, *Atlantic Ocean, Mathematical studies, Computer models, Stochastic processes, Simulation analysis, Monte Carlo method, Path of pollutants, Planning, *Outer Continental Shelf lease area.

An oilspill risk analysis was conducted to determine the relative environmental hazards of developing oil in different regions of the mid-Atlantic Outer Continental Shelf lease area. The study analyzed the probability of spill occurrence, likely paths of the spilled oil, and locations in space and time of recreational and biological resources that are likely to be vulnerable. These results are combined to yield estimates of the overall oilspill risk associated with development of the proposed lease area. The analysis implicitly includes estimates of weathering rates and slick dispersion and an indication of the possible mitigating effects of cleanups. Assuming that economically recoverable amounts of petroleum are found in the area, the leasing of the tracts proposed for sale 49 will increase the expected number of spills by about 20-25 percent over the number expected from the existing (sale 40) leases. The probability that an object such as land will be contacted by a spill is increased by at most five percentage points. (Woodard-USGS)

LAS VEGAS VALLEY WATER BUDGET: RELATIONSHIP OF DISTRIBUTION, CONSUMPTIVE USE, AND RECHARGE TO SHALLOW GROUNDWATER,
Nevada Univ. System, Las Vegas. Desert Research Inst.
R. O. Patt.
Publication No. EPA-600/2-78-159, July, 1978. 61

p, 16 fig, 8 tab, 19 ref, 3 append.

Descriptors: Groundwater, *Groundwater recharge, *Water consumption, *Return flow, *Consumptive use, Artificial recharge, *Nevada, *Distribution, *Las Vegas Valley(NV).

Estimates of quantity and geographic distribution of recharge to the shallow groundwater zone from water use return flows in Las Vegas Valley were made for the years 1973, 1965, 1968, 1960, and 1943 as part of a broader study on the impact of water and land use on groundwater quality. Considered components of water use in Las Vegas Valley include the following: supply from surface and groundwater; agriculture using potable water; agriculture using sewage effluent; residential lawn watering; lawn watering of parks, schools, cemetaries, hotels, motels; golf courses using potable water; golf courses using sewage effluent water; septic tank recharge; evaporative coolers; system losses' industrial use; power plant cooling; swimming pool use; consumptive use by phreatophytes; in-valley recharge from precipitation, and 'unaccounted for water.' Consumptive use of plants was calculated through use of the Blaney-Criddle method as 3.47 feet per year and recharge was assumed to be the difference between applied water and calculated consumptive use. Data developed during this study indicated consumptive use as determined by this method could be low by 1.5 to 2 feet per year, and thus the following estimates of recharge to the groundwater system are considered maximum, in acre feet: 1973-39,000; 1965-27,600; 1958-26,650; 1950-13,000; and 1943-21,000. TECHNICAL GUIDELINES FOR PUBLIC WATER SYSTEMS.
Clean Water Consultants, El Dorado Hills, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 217, Price codes: A20 in paper copy, A01 on microfiche. Final Report, June 16, 1976. 477 p, 776 ref, 3 append. 68-01-2971.

Descriptors: *Water supply, *Water quality control, *Water treatment, *Water management, Water quality act, Personnel, Design criteria, Water quality standards, Chlorination, Fluoridation, Distribution systems, Planning, Water analysis, Water chemistry, Manuals, Engineering, Systems analysis, Maintenance, Operations, Pumping plants, Water storage.

Technical guidelines for the design, operation, maintenance, staffing and surveillance of public water systems are presented. The manual was prepared to give information on Federal requirements and regulations and as a further guide to professional engineers responsible for the design and construction of public water supplies. Ten sections are developed, each of which has a summary of standards, a discussion of design parameters, and a rationale for standards. The topics covered include: general design considerations, source development, treatment, chemical application, pumping facilities, storage, distribution systems, operation and maintenance, surveillance, and personnel. An extensive bibliography is provided, and three appendices containing a glossary of terms, typical job descriptions, and addresses for obtaining standard documents and references is included. (Davison-IPA)

PROGRAM IMPLEMENTATION PROCEDURES: IMPLEMENTATION OF TWO YEAR POST HIGH SCHOOL WASTEWATER TECHNOLOGY INSTRUCTIONAL PROGRAMS.
Clemson Univ., SC. Dept. of Environmental Systems Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 595, Price codes: A03 in paper copy, A01 in microfiche. 1973. 47 p, 2 fig, 2 tab, 1 append. T-900168.

Descriptors: *Education, *Training, *Waste water treatment technology, *Personnel, Programs, Training procedure, Training institutions, Training requirements, Employment opportunities, Occupations, Waste treatment, Waste water treatment, Plant operations, Education, Schools(Education), Technology transfer.

A revised edition of the 1970 publication, 'Criteria for Establishment of Two Year Post High School Wastewater Technology Programs,' is presented. Experience with this project, originally designed as a federally funded concept, showed that the program could be adapted for any two year post high school institution wanting to provide a program for waste water technicians. The major attributes of such an institution are summarized, and suggestions for administering this program are given. A suggested two year program, including course descriptions prepared in performance terms, is provided. (Davison-IPA)

EVALUATION OF PROPOSED NPDES LIMITATIONS FOR HOMESTAKE MINING COMPANY AND LEAD-DEADWOOD SANITARY DISTRICT NO. 1.
National Inforcement Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 596, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-330/2-75-002, February 1975. 25 p, 1 fig, 6 tab, 10 ref, 1 append.

Descriptors: *Mine wastes, *Sewage districts, *Bioassays, *Cyanide, *Fishkill, Cold water fish, Fisheries, Water pollution, Water pollution effects, Effluents, Waste water treatment, Water quality control, Water pollution control, Water pollution sources, Whitewood Creek, Spearfish Creek, Lead, South Dakota, Toxicity, Chlorides, Chlorine, Simulation analysis.

Results are presented of an investigation: to determine the toxicity of the 1977 effluent conditions as proposed in the NPDES permits to Homestake Mining company and Lead-Deadwood Sanitary District No. 1, Lead, South Dakota; and to determine the suitability of background and receiving waters of Whitewood Creek and Spearfish Creek for support of a cold water fishery. Bioassays of the simulated wastes demonstrated that both effluents are acutely toxic in that test fish were killed within 96 hours. It was indicated that the proposed 1977 permit limitations were inadequate. The combined wastes of the mining company and the sanitary district were considerably more toxic than that of the mining company alone. This was attributed to the complexing of cyanide and chlorine which formed cyanogen chloride. The slime plant and sand plant effluents contained approximtely the same concentrations of cyanide as the simulated wastes; cyanide was found to be the principle toxic agent. Neither heavy metals nor un-ionized ammonia, at levels specified in the 1977 permit, contributed to the toxicity of the tested waters. In situ exposure of rainbow trout demonstrated that Whitewood Creek, in the area upstream from the Gold Run confluence was extremely toxic. (Davison-IPA)

CHARACTERIZATION AND EVALUATION OF WASTEWATER, UNITED STATES STEEL CORPORATION, HOMESTEAD WHEEL AND AXLE PLANT, MCKEES ROCKS, PENNSYLVANIA, AUGUST 21-28, 1975.
National Enforcement Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 593, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-330/2-76/019, January 1976. 78 p, 7 fig, 16 tab, 2 ref, 5 append.

Descriptors: *Industrial wastes, *Water pollution, *Ohio River, *Pollutant identification, Effluents, Influents, Water quality control, Outfall sewers, Oil, Phenols, Oil wastes, Trace elements, Zinc, Cyanide, United States Steel Corporation, Homestead Wheel and Axle Plant, Mc Kees Rocks, Pennsylvania, Allegheny River, Monongahela River, Waste treatment, Monitoring.

Results of a study of the waste water discharges by a United States Steel Corporation (USSC) plant are summarized. Homestead Works occupies three separate areas: the Carrie Furnace area and the Main Homestead areas are on the Monongahela River upstream of the confluence of the Ohio, Monongahela, and Allegheny Rivers; The Wheel and Axle Works is located on the Ohio River at Mc Kees Rocks, Pennsylvania. Waste waters are discharged from the Mc Kees Rocks plant through three outfalls, 018, 019 and 020, into the Graham Street storm sewer which empties into the Ohio River. Outfall 018 contained only cooling water from the axle forge, and flows ranged from 0.52 mgd to 0.99 mgd during the monitoring with an average of 0.72 mgd. Outfall 019 consisted of untreated cooling water from the power house and the effluent from the oil treatment plant, and flows ranged from 1.38 mgd to 1.71 mgd, averaging 1.62 mgd during monitoring. USSC proposed that TSS and oil/grease be monitored at 119 rather than 019, but since 019 contains flow from all waste sources in the wheel mill and power house it was decided that monitoring should remain at outfall 019. Flow from outfall 020, a non-permitted discharge containing quench water from the machine shop, averaged 2,300 gpd. TSS and oil/grease levels were insignificant during the monitoring. Grab samples from the storm sewer discharge to the Ohio River had low levels of organic compounds not found in USSC discharges. Treatment processes removed approximtely 95% of the influent grease/oil load and 38% of the influent TSS load. USSC methods of determining flows only measure flows from the waste oil treatment facility, all other flows are estimated. (Davison-IPA)
W79-02791

CHARACTERIZATION AND EVALUATION OF WASTEWATER SOURCES, UNITED STATES STEEL CORPORATION, DUQUESNE PLANT, PITTSBURGH, PENNSYLVANIA, FEBRUARY 26-MARCH 6, 1976.
National Enforcement Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 594, Price codes: A07 in paper copy, A01 in microfiche Report No EPA-330/2-76/024, May 1976. 144 p, 22 fig, 27 tab, 7 ref, 4 append.

Descriptors: *Industrial wastes, *Water pollution, *Monongahela River, *Pollutant identification, Outfall sewers, Water quality control, Oil, Oil wastes, Trace elements, Effluents, Cyanides, Zinc, Ammonia, Phenols, Sampling, Organic compounds, United States Steel Corporation, Duquesne Plant, Monongahela River, Pittsburgh, Pennsylvania, Waste treatment, Monitoring.

Results of a survey of waste water discharges to the Monongahela River from the United States Steel corporation's (USSC) Duquesne Plant are summarized. The Duquesne Plant, located on the west bank of the Monongahela river at Pittsburgh, Pennsylvania, is primarily an iron and steel production facility with some finishing operations. There are seven major outfalls, 011, 012, 013, 014, 015, 016, and 017, and four intermediate outfalls, 111, 211, 112, and 114, through which all wastes are discharged. Except for process wastes from the blast furnaces, BOF (basic oxygen furnace), primary mills and bar mills, all waste waters are untreated. Treatment facility evaluations included influent and effluent sampling to determine removal efficiencies. Blast furnace process waste waters, consisting of mostly venturi gas washer flows treated by gravity thickening, were discharged to outfall 111, averaged 6.4 mdg, and contained suspended solids, ammonia, phenolics, cyanide, iron, and zinc. Findings of the in plant monitoring for the other outfalls are discussed and monitoring

requirements for seven of the outfalls is presented. It is concluded that USSC monitoring procedures are not sufficient to characterize the waste water quality or determine daily loads because of the widely varying flow. (Davison-IPA)

CHARACTERIZATION AND EVALUATION OF WASTEWATER SOURCES UNITED STATES STEEL CORPORATION, EDGAR THOMPSON PLANT, PITTSBURGH, PENNSYLVANIA, JULY 22-AUGUST 5, 1975.
National Enforcement Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 589, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA/330/2-75/011, December 1975. 76 p, 6 fig, 9 tab, 3 ref, 6 append.

Descriptors: *Industrial wastes, *Water pollution, *Monongahela River, *United States Steel Corporation, Water quality control, Water pollution, Water pollution sources, Effluents, Oil wastes, Outfall sewers, Phenols, Zinc, Metals, Cyanides, Monitoring, Sampling, Trace elements, Organic compounds, Pittsburgh, Pennsylvania.

Results of the National Enforcement Investigations Center (NEIC) survey of the waste water sources of United States Steel Corporation's (USSC) Edgar Thompson Plant at Pittsburgh, Pennsylvania are discussed. The Edgar Thompson Plant consists of a sintering plant, five blast furnaces (BF), two basic oxygen furnaces, a 44-inch slab mill, and an ingot mold facility. The Monongahela River supplies the facility with up to 210 mgd of water via two intake stations; a small portion of this water is treated. Waste water is discharged from five outfalls; 001, 002, 003, 004 and 010. All outfalls, except 001, discharge into the Monongahela River; outfall 001 discharges into Turtle Creek, a Monongahela tributary. Waste waters from the outfalls was monitored and samples taken were analyzed. A comparison of the loads discharged during the monitoring period with USSC proposed load limitations reveals that the proposed load limitation for oil and grease were exceeded during six of the seven day monitoring period, and the average daily load was 300% in excess of the proposed limitations. USSC monitored only the portion of the wastes through 002 which contained effluent from the No.1 and 2 BF thickener and cooling water from No. 1 BF and power station No. 2. Non-monitored discharge from this outfall contains ingot mold foundry settling basin effluent, BF No. 1 cooling water, and Stirling boiler house and No. 1 power station effluents. No. 1 power station waste water was not identified previously to EPA. (Davison-IPA)

WIND POWERED AERATION FOR REMOTE LOCATIONS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering; and Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
P. M. Schierholz, W. L. Somervell, Jr., W. Babcock, R. Hartel, and K. Watson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 304, Price codes: A04 in paper copy, A01 in microfiche. Progress Report No. NSF/RA-760238, April 1976. 74 p, 22 fig, 9 tab. AER 75-00833.

Descriptors: *Aeration, *Wind velocity, *Winterkilling, *Windmills, Air circulation, Climatology, Weather, Weather data, Aquatic life, Oxygenation, Fish, Sewage lagoons, Lakes, Design criteria, Water pollution.

The use of wind powered aerators for the prevention of winterkill was studied. Design criteria for a wind powered aerator stipulates that it be light, easily handled, simple to install, economic and durable. The wind powered aerators for this study were constructed from 'off-the-shelf' and other parts readily available. The windmills tested and their four remote installation sites are summarized. The site at Keenesburg, Colorado, a sewage lagoon, required special equipment. Although the aerator operated all winter, insufficient oxygen was delivered to the lagoon to make a discernable difference in dissolved oxygen, due to the mild winter. At Robber's Roost, a high plains lake, the aerator operated most of the winter where a large hole was kept open in the ice almost all winter; no winterkill was indicated. Wind data for Reagan Lake, a high mountan winterkill lake, show this location has insufficient winds to support a windmill most of the time, and it is suggested that this lake be abandoned. The aerator at Lost Lake, a high mountain winterkill lake, was an experimental design, and although there were numerous problems associated with it, it was operational during the critical period. Fishing here was better than in previous years. Data from the weather stations maintained at the windmill sites and installations at other Colorado locations have not yet been analyzed. (Davison-IPA)

INVENTORY OF INTERSTATE CARRIER WATER SUPPLY SYSTEMS BY STATES AND ENVIRONMENTAL PROTECTION AGENCY REGIONS.
Environmental Protection Agency, Washington, DC. Office of Water Supply.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 630, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-520/9-74-017, July 1974. 91 p, 12 tab.

Descriptors: *Water supply, *Water quality standards, Statistics, *Data collections, Regions, States, Water analysis, Microbiology, Bacteriological data, Certification, Public health, Potable water.

Tabulated data reporting the 1974 certification status of water supply systems serving interstate carriers is presented. The systems are certified annually by Environmental Protection Agency (EPA) Regional Administrators on the basis of recommendations and data submitted by the states. Systems in acutal compliance with the standards are classified as approved. The five provisional classifications are: (1) provisionally approved, (Q), water quality standards are violated; (2) provisionally approved (B), bacteriological sampling requirements have not been met; (3) provisionally approved (F), deficiencies in the facilities reduce its dependability; (4) provisionally approved (O), significant deficiencies in the operation of the system; and (5) provisionally approved (N), available bacteriological data are more than 18 months old. The inventory table is arranged according to EPA regions and the status therin. (Davison-IPA)

TASTE AND ODOR, MISSOURI RIVER, IOWA TRIBUTARIES AREA, IOWA-NEBRASKA, 1970.
Environmental Protection Agency, Kansas City, MO. Region VII.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 669, Price codes: A05 in paper copy, A01 in microfiche. Interim Report, 1970. 83 p, 3 fig, 41 tab, 13 ref.

Descriptors: *Water quality, *Baseline studies, *Missouri River, *Omaha, Aquatic microbiology, Biochemical oxygen demand, Coliforms, Municipal wastes, Industrial wastes, Water analysis, Monitoring, River systems, Tributaries, River flow, Activated carbon, Phosphorous, Runoff, Water properties, Taste, Odor, Sampling.

Recurring taste and odor problems experienced by the Omaha waterworks which prompted the Omaha Metropolitan Utility District's request for assistance resulted in this investigation. Previous efforts by local, State, and Federal groups have failed to provide solutions to the problem. Eight sampling sites were selected, and fifteen sample runs at three day intervals were scheduld before and after the expected flush of taste and odor causing materials. The parameter groups selected for study were: baseline and physial parameters; taste and odor related parameters; and nutrient and organic load parameters. Since no sever-taste and odor problems developed during March 1970, some resources were diverted from the survey effort and not all the planned work was accomplished. However, the tributory water produced a noticable impact on the Missouri River at Omaha during the survey period. During the flush priod on the tributory, actinomycete colony counts of 11,000 and 12,000/milliliter were obtained. Higher neutral and weak acid fractions were found in the Missouri River at Omaha and in the Boyer River as opposed to the Missouri River at Yankston by chloroform extracts from activated carbon column samples. The phosphorous and Biochemical Oxygen Demand loads from municipal and industrial waste discharges in the Sioux City area during pre-runoff conditions were a significant part of the total load of these factors in the Missouri River at Omaha. Dissolved and suspended nutrient concentrations increased from pre-runoff to runoff flow levels. (Davison-IPA)

SOIL MORPHOLOGIC AND HYDRAULIC CHANGES ASSOCIATED WITH WASTEWATER IRRIGATION,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
T. W. Simpson, and R. L. Cunningham.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-291 399, Price codes: A10 in paper copy, A01 in microfiche. Research Project Technical Completion Report, November, 1978. 201 p, 21 fig, 10 tab, 32 ref, 4 append. OWRT A-045-PA(1), 14-34-0001-8040.

Descriptors: *Waste water irrigation, *Return flow, *Soil physics, Soil structure, Moisture, Soils, Sinks, Water table, Soil temperature, Soil bacteria, Soil treatment, *Morphologic properties(Soils), Hydraulic properties, *Mottling, Flow channels, Soil color.

Fifteen topographically matched pit transects were examined in treatment areas. Detailed profile descriptions and sketches were prepared for each transect. The morphologic data were quantified using a relative morphology rating scale developed to show differences in morphologic properties that could be related to hydraulic properties that had been significantly altered due to wastewater irrigation. This total score was used to establish suitability levels for sites based on the scores from the relative profile rating scale. Potential longevity of the site for wastewater irrigation was estimated using the average annual percentage of decrease in the relative profile rating score for all treatments, assuming a linear rate of change. U.S. EPA (1975) guidelines were used to make decisions on suitability using morphologic criteria. Morphologic propertis such as mottling, soil structure and moist consistence have changed due to wastewater irrigation. The 118 and 231 cm per year treatment areas have been altered sufficiently so they are not suitable for irrigation. The 59 cm per year area was considered marginally suitable for continued wastewater irrigation. The soils of the wastewater irrigation site occurred in extremely complex patterns prior to irrigation because of landscape overturning due to sinkhole formation and filling. Most flow through soils appears to follow specialized flow channels. (Sisk-Penn State)

INSTITUTIONAL ARRANGEMENTS FOR AREA-WIDE QUALITY PLANNING AND MANAGEMENT, SECTION 208 APPLIED IN THREE METROPOLITAN AREAS OF THE GREAT LAKES,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
P. C. Metzger, C. B. Alter, and J. W. Bulkley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 433, Price codes: A05 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, East Lansing, Project Completion Report, Jan 1979, 98 p. OWRT A-096-MICH(1), 14-34-0001-8091.

Descriptors: *Area-wide water quality planning, *208 plans, *Institutional aspects, *Management, *Planning, Cities, *Water quality control, *Regional analysis, Legal aspects, *Metropolitan Areas of the Great Lakes, Detroit, Chicago, Cleveland.

The Section 208 legal framework for area-wide water quality planning has been reviewed. Management and control issues of area-wide water quality planning are identified as well as constitutional considerations and conflicts in multi-tier government program administration. 208 plans and processes in three metropolitan areas of the Great Lakes are reviewed. The legal framework section is applied in terms of the fulfillment of management structure requirements for the Detroit 208 area, Chicago 208 area, and the Cleveland 208 area. Variations in the formulation of institutional structures for the 208 areas are noted. The different roles of the several states in the development of the 208 plans are identified. Resistance to institutional change is identified as an important constraint impacting upon 208 management structure. Institutional factors are identified as the primary elements acting to limit the applicability in this country of the English and Welsh model of the Regional Water Authority. The proposa by U.S. EPA for implementing water quality programs through a new contractual devise between EPA and each of the states is presented. Lack of information upon this proposal precludes any conclusion as to whether or not the statutorily mandated function of water quality planning and implementation on a regional basis will in fact be maintained.

Descriptors: *Mercury, Rubber, Plastics, Adsorption, Water pollution control, Absorption, Mercury removal.

When a 203Hg(NO3)2 solution was kept in glass or polypropylene containers, different fractions of the radioactivity were absorbed on the container walls depending upon the chemical solution being used. The following factors affecting the removal of mercurials from aqueous solution stored in glass were examined: type and concentration of absorbent (fiber glass and rubber powder); pH; pretreatment of the rubber; and the form of mercury used. Rubber was equally effective in the adsorption of organic and inorganic mercury. The pH of the aqueous 203Hg2 + solution was not a critical factor in the rate of adsorption of mercury by the rubber. In addition, the effect of soaking the rubber in water for 18 hr. did not show any statistical difference when compared with nontreated rubber. It can be concluded that rubber is a very effective adsorbent of mercury, and thus, can be used as a simple method for control of mercury pollution.

THE WHITE AMUR AS A BIOLOGICAL CONTROL AGENT OF AQUATIC WEEDS IN THE PANAMA CANAL,
Panama Canal Co., Balboa Heights, Canal Zone.
P. E. Custer, F. D. Halverson, J. Malone, and C. V. Chong.
Fisheries, Vol. 3(5), Sept.-Oct. 1978, p 2-9, 6 fig.

Descriptors: Aquiculture, Algae, *Canal zone, Aquatic plants, Aquatic weed control, *Aquatic weed control, Herbivores, Water temperature, Herbicides, Biological treatment, Arkansas, Macrophytes, Methodology, Dissolved oxygen, Fish transport, Laboratory tests, *Biocontrol, *White amur, Acclimation, *Panama Canal Zone, Gatun Lake.

The Panama Canal has been plagued with both floating and submerged aquatic weeds since its opening. Although more and more money has been spent on herbicides over the years, the weed problem has become more intense. In February 1978 the Panama Canal Company introduced the white amur as a biological tool to control the submerged macrophyte hydrilla to Gatun Lake, the large freshwater reservoir through which the majority of the length of the Canal passes. The first shipment of fish (125,000) did not successfully withstand the rapid change from cold Arkansas water temperatures to the warm tropical waters, with a resultant loss of about 50 percent. A tempering facility to acclimate a second fish shipment was constructed that circulated chilled lake water through a large fish-holding tank for a period of two days, during which time the temperature was gradually elevated and salt and disinfectants were added to the water. After tempering, the fish were successfully implanted in isolated arms of the lake, a helicopter being used for transportation. (EIS-Katz)

MANAGING OIL AND GAS ACTIVITIES IN COASTAL ENVIRONMENTS,
Fish and Wildlife Service, Washington, DC.
W. L. Longley, R. Jackson, and B. Snyder.
Biological Services Program. Report FWS/OBS-78/54. 1978. 66 p.

Descriptors: *Wetlands, *Environmental effects, *Oil industry, Salt marshes, Coastal marshes, Marshes, Ecosystems, Marsh plants, Oil, Oil fields, Drilling, Oil wastes.

General information is presented on the environmental effects on petroleum development activities upon coastal wetlands. Part One consists of brief descriptions of several types of coastal ecosystems, grouped into three categories: uplands, seasonally flooded wetlands, and saturated wetlands and open water. Characteristic vegetation, animals, water regimes, and management practices are included. Part Two deals with the impacts of petroleum development activities, ranging from pre-exploration surveys through termination of production. Depending upon the category of ecosystem involved, the execution of some of the petroleum development activity varies. In addition to describing the activity and its impacts, this chapter contains comments and suggestions that can help to mitigate the effects of each activity. (Steiner-Mass)

REEDS CONTROL EUTROPHICATION OF BALATON LAKE,
Research Inst. for Water Resources Development, Budapest (Hungary).
L. Toth.
Water Research, Vol. 6, p 1533-1539, 1972. 3 fig, 3 tab, 13 ref.

Descriptors: *Marsh plants, *Sewage effluents, *Water purification, Wetlands, Fresh water marshes, Marshes, Sewage disposal, Waste water(Artificial), Nutrients, Biological treatment, Water quality, Lakes.

The effect of effluents from sewage purification plants passing directly into Lake Balaton, Hungary was compared with the effect produced in passing the effluent through a reed wetland first. The phosphorus and nitrogen content of the effluent is utilized by the ha organisms on the reeds in the period of low load in July and during the maximum load in August, and hardly detectable amounts of nitrogen and phosphorus get into the open water of the lake. With regard to lake protection, two conflicting observations were made. The lake is said to be protected by the reeds only

during one season, as in the autumn when the reeds die down the materials retained by them are mixed with lake water by wave-action; on the other hand, the food materials discharged into the reeds and stabilized in the bodies of the living organisms there which are either eaten by fish or leave the water for dry land, might decrease the trophic grade of the lake. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

IDENTIFICATION AND INITIAL EVALUATION OF IRRIGATION RETURN FLOW MODELS,
Irrigation Hydrology Co., Fort Collins, CO.
W. R. Walker.
Publication No. EPA-600/2-78-144, July, 1978. 124 p, 3 fig, 4 tab, 160 ref, 6 append.

Descriptors: *Return flow, *Mathematical models, Irrigation, Water resources, Water pollution, Water, Simulation analysis, Water quality, Soil water, Soil chemistry, Evapotranspiration.

A broad based literature review was undertaken to identify studies that had yielded digital computer models applicable to irrigation return flow (IRF) systems. The programs not listed in technical reports or papers were requested from the various authors. The resuls of this work are 43 computer models applicable all or in part to the analysis of IRF's and their quality. A brief evaluation of each model is given. IRF modeling technology is well developed theoretically but not completely verified due to the large scale of the irrigation system. Most models remain in the research sphere and need to be redefined for the wider utilization of planners. Field data are generally not available to satisfy the input requirement of most IRF models. Accuracies of predictions need to be determined against standarized conditions in order to further model development and parameter sensitivities should be investigated to isolate the most important field data. In: Proceedings American Institute for Decision Sciences, Sixth Annual Meeting, Western Regional Conference, Phoenix, March 17-18, 1977. 5 p, 7 fig, 3 tab, 13 ref, Append.

Descriptors: *Model studies, *Performance, Optimization, Social perception, *Signal detection theory.

Experiments are reported testing people's ability to detect differences in population variance from small samples. The model adopted is that of signal detection theory (SDT), yielding measures of sensitivity that are independent of the response criterion and that can be compared with optimal performance. The results were consistent with SDT. Contrary to expectation, the best performance was very nearly optimal under every condition. Making the mode of presentation more abstract--from visually perceived dispersion of points on a line to numbers to letters to verbal categories--did not signficantly affect the high level of relative performance.

Descriptors: *Resource base, *Aquatic environment, *Recreation, Recreation participation, Activity clusters, Recreation facilities, Sociology, Social participation.

While substantial effort has been undertaken to understand the consequences of industrial and agricultural uses for the environment, concern has also been expressed about its other uses, including recreation. Little is known about the relationship between recreational behavior and an environmental resource base. This paper focuses upon participation in a specific outdoor recreation activity or activity-cluster and dominant resource base where participation occurs. Resource bases identified were river, lake, ocean, swamp/marsh, forest/mountain, range/farm and city/town. Emphasis is placed upon aquatic environs and participation in water-based recreation. Water activities constituted from 14-30 percent of all outdoor activities taking place at those resource bases identified. Aquatic environments provided the resource base for 38 percent of all recreation participation events, water- and non-water based, occurring during one reporting period. While participation in water-based activities requires a water resource, the array of participation patterns reported suggests that resource bases defined as recreation places provide a wide range of opportunities for non-resource-dependent recreation activities. One conclusion is that resource bases cannot be distinguished by the recreation activities occurring on them. Resource bases in fact facilitate a wide range of recreation activities, some holding little direct connection with the resource base, nor are the conditions of the resource sufficient to predict behavioral outcomes.

LINEAR PROGRAMMING MODEL TO QUANTIFY ECONOMIC, ENVIRONMENTAL AND SOCIAL VALUES OF A TIDAL MARSH,
Columbia Univ., New York. School of Engineering and Applied Science.
D. Hill.
PhD Dissertation, 1977. 107 p.

Descriptors: *Salt marshes, *Appraisals, *Value, *Economic efficiency, Wetlands, Tidal marshes, Coastal marshes, Evaluation, Cost analysis, Model studies, Social values, Marsh plants.

The formulation of a resource allocation model provides a structure in which economic, scientific, and political considerations are given a place in setting a dollar value on salt marsh. To illustrate the method, data are drawn from the literature of a number of Atlantic Coast marshes to describe a hypothetical composite bay. Typical uses of an estuary are comprised in a linear programming model which is initially solved to determine the mix that maximizes their dollar value. The value of a marginal acre of marsh grass under these circumstances is given by its shadow price. This varies according to its effectiveness in nutrient removal and its production of detritus. To show the effect of the unquantifiable values of the natural salt marsh, its market price is then increased parametrically to determine alternative resource allocations in which a larger amount of the salt marsh is preserved. As indicated by the shadow price in each case, the additional value of unquantified environmental and social effects must break even with the opportunity cost of providing them. The cost increase of each alternative can then be weighed by the decision maker in judging the

desirability of preserving more acreage of salt marsh. (Steiner-Mass)

NEW CONSIDERATIONS FOR MUNICIPAL WATER SYSTEM PLANNING,
Montgomery (James M.)
R. H. Ellis.
Water Resources Bulletin, Vol. 14, No. 3, p 542-553, June 1978. 3 fig, 6 ref.

Descriptors: *Municipal water, *Planning, *Effects, Waste water (Pollution), Reclamation, Water reuse, Water conservation, Financial constraints, Public attitudes, Environmental concerns, Enegy utilization, Safe Drinking Water Act, Coordintion.

The primary objectives are to identify new considerations which should be incorporated into the planning of municipal water systems, and to assess the potential effects of these new considerations on traditional planning concepts. Generally, master water plans include analyses of supply and demand, descriptions of existing facilities, and proposed construction programs. Although many master water plans do consider the potential effects of future conditions, recent advances in technology and changing social concerns are beginning to exert a significant influence on the future course of water system development. Some of the new considerations which should be incorporated into municipal water system planning include the Safe Drinking Water Act, coordination with wastewater planning, wastewater reclamation and reuse, water conservation, environmental concerns, energy utilization, financial constraints, and changing public attitudes. In order to provide a responsive and effective framework for future planning of municipal water systems, the influence of these new considerations must be carefully evaluated in conjunction with traditional planning concerns. FACTUAL INPUTS FOR ALLOCATION DECISIONS CONCERNING SCARCE WATER RESOURCES,
Washington Univ., St. Louis, MO. Dept. of Technology and Human Affairs.
L. Icerman.
Water Resources Bulletin, Vol. 14, No. 3, p 651-662, June 1978. 12 tab, 17 ref

Descriptors: *Industrial water, *Water utilization, *Water allocation(Policy), *Water resources, *Scarce water, Decision making, Water consumption, Patterns, Consumptive use, Crop production, Irrigation, Energy development, Assessment, California.

Factual inputs which may be useful for completing first-order assessments to aid decision making on the allocation of scarce water resources are compiled. Water needs of major manufacturing industry groups and of minerals industries show wide variations in serveral measures of water use intensity. The chemicals and allied products and primary metals industries dominate the total water intake and consumptive water use by manufacturing industries. Consumptive use per employee for the petroleum and coal products industry groups in nearly 2.5 times higher than that for any other industry group. Estimates of the water requirements per unit energy output for energy-processing systems vary by as much as an order of magnitude. Agricultural water use is large than that of any other industry but water use for irrigation is not expected to increase significantly by the year 2020. In California, the production of crop calories and proteins per unit of irrigation water applied may vary by more than an order of magnitude. Crops which offer larger monetary returns per acre are irrigated most frequently. (Bell-Cornell).

VALUES AND CHOICES IN THE DEVELOPMENT OF THE COLORADO RIVER BASIN.
American Association for the Advancement of Science, Washington, DC. Committee on Arid Lands.
University of Arizona Press, Tucson, 1978. 337 p. Peterson, D.F. and Crawford, A.B., eds. $7.50.

Descriptors: *River basin development, *Colorado River Basin, *Resources development, *Water utilization, Arid lands, Land use, Energy conversion, Regional analysis.

The framework for the presentations in this book, divided into 'historical perspectives' and 'future directions', derives from a AAAS symposium sponsored by the Association's Committee on Arid Lands, San Francisco, 1974. As the arid southwest continues developing and changing, the Colorado River Basin and its vast hydrocarbon fuel resources will increasingly be the subject of study. While the Basin's mineral, agricultural, grazing, recreational, wilderness and archaeological resources will come under scrutiny, the River itself remains the dominant value of the region. The use of all the Basin's resources requires a readily available source of water which is, in this case, already completely used or in a transitional stage of use. While the Colorado may be unique in many ways, it is also typical of other arid region river basins experiencing increasing demands and transitional forces. Discussed here are the general characteristics of the Basin that qualify it as a proper representative of arid zones undergoing similar transitional processes throughout the world. (Tickes-Arizona)
